THE  
ARCHITECT

A WEEKLY  
ILLUSTRATED JOURNAL  
OF  
ART,  
CIVIL ENGINEERING,  
AND  
BUILDING.

---

*Ah, to build, to build!  
That is the noblest art of all the arts.  
Painting and Sculpture are but images,  
Are merely shadows, cast by outward things  
On stone or canvas, having in themselves  
No separate existence. Architecture,  
Existing in itself, and not in seeming  
A something it is not, surpasses them  
As substance shadow.*

LONGFELLOW.

## A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

### SCHOOLS OF DESIGN AND SCHOOLS OF DRAWING.

**S**IR HENRY COLE, with all his faults, will long be remembered as a benefactor to the arts and a benefactor to his country. Most people, moreover, will not be too critical as regards the particular meaning which is to be attached to every word in this compliment. Every powerful man makes enemies, and Sir HENRY was above all things a powerful man;

but even the bitterest of his enemies—if any of them all could permit their enmity to continue now—must acknowledge that his memory deserves to be cherished with sincere regard as the bold and uncompromising constructor of the great artistic establishment of South Kensington. Nevertheless, when we look more closely into the matter, it may be seen that, whatever it may be as a show, South Kensington as a school has a very serious flaw in its constitution, and that the artistic interests of the country, at the present very trying time, threaten to suffer materially in consequence. The flaw is that the teaching of drawing is confounded with the teaching of design. Indeed, it is called by the name, and the Schools of Design of England are, in the eyes of experts, mere drawing schools.

In this journal we have several times during the last few years taken occasion to direct attention to the opinion that architects' offices are probably destined to be the nurseries of ornamental art at large; and the contrast thus indicated between the work which is done in such places of business and that which is done in the Schools of Design, may be at once suggestive to many readers of the line of argument which we are disposed to pursue in objecting to the South Kensington system.

It is not necessary to inquire into the origin of that system, or to weigh precedents and authorities in its favour. The English intelligence when directed towards artistic work may claim to be peculiarly constituted. It is essentially a common-sense intelligence, relying upon substantialities much, and upon superficialities little; but at the same time it is often deficient in those instincts which are the hereditary possession of some other nations, and it is therefore too ready sometimes to be satisfied with the superficial when the substantial is not clearly discerned. It is not brilliant, that is to say, nor effervescent, nor quick; it is dull, rather and slow; but neither is it frivolous nor flippant; it is thoughtful according to its lights, patient and plodding, and occasionally philosophical.

Accordingly, it seems to us that, with predispositions of the nature here described, the thing which our English artistic students especially require is to be trained in technical principle. The why and wherefore ought always to be well considered. It is not enough to acquire by practice a certain sleight of hand. The substantial which always underlies the superficial ought, in other words, to be the more particular subject of exposition and exercise. Hence, therefore, as we venture to say, the superiority of the kind of training which is

obtained in a good architect's office over that kind which is had at the Government schools, under the South Kensington system and generally under South Kensington teachers.

Now there is perhaps no other characteristic of South Kensington which more strictly identifies the whole organisation with the spirit of Sir HENRY COLE as its founder than the circumstance that superficial criticism usurps the place of substantial. Drawing represents design. Mode is taken to be mind. To imitate well is to originate. The facile hand is the understanding. A mechanical pencil is the genius of art.

We do not say that Sir HENRY COLE was a shallow man. An amateur he was, of course; never anything like an artist himself, but an admirer of art; a born administrator of many things, and, amongst the rest, of things artistic and educational; but a superficialist by the very nature of the case, a man of vigorous action rather than of calm reflection; a soldier, not a philosopher. But, even without himself being shallow, such a man would be very likely to make shallow work of such an object as art; and if it is the general opinion of artists that South Kensington is a shallow organisation, it is not therefore to be wondered at. Drawing, in fact, becomes shallow design.

Fortunately for England nowadays, the spirit of technical art is stirring up the minds of practical people all over the land. Not only at metropolitan headquarters, but almost still more at the provincial foci of our various manufacturing industries, the natural enterprise of the people is exhibiting an earnest desire to vie with certain foreign nations in all that can contribute grace to the products of our unrivalled manual skill. This grace is discovered to be the thing that we emphatically want, and must have. Without it we should have to give way in the world's markets; and we cannot consent to do that. Schools of design, therefore, are being set on foot everywhere, and drawing is becoming almost a national pursuit compared with what it was twenty or thirty years ago. For this we have still to thank Sir HENRY COLE more than any one else. But if we are to have Design and not mere Drawing, we shall have to thank some one else. It is no small thing to have introduced the drawing-master; but it is not by any means enough.

The true technical education of a decorative artist must be carefully based and built up on a primary knowledge of the structural principles which are the vital essence of his fabric. Take a carpet pattern which is woven and a carpet pattern which is printed; or make the same comparison in any other textile material. Every one knows now—criticism has at least got thus far—that the one of these patterns, even when the two are precisely the same and the materials are the same, is a mere nonsense pattern. The other may be bad enough in its way, but this is worse than bad; it is insulting to the understanding. Far be it from us to say that the instinct of a Frenchman would tolerate the printing in place of the weaving; but we are very much disposed to suggest that there are a good many somewhat similar instances in which the plain and sluggish common-sense of the Englishman is in a manner more fastidious, if it has fair-play, than the bright and hasty instinct of his neighbour. Neither would we care to assert plainly that Sir HENRY COLE personally would have sanctioned the sham pattern, or that any one of his successors in particular would sanction it now; but what we fear is that there is not a little

in the disposition of South Kensington formulas as a whole which is calculated to overlook permanently the underlying elements so long as the superficialities seem to be according to rule. If we are able to affirm with confidence that the distinction here apparent is that which divides the professional artist from the amateur, and if, as is generally supposed, there has always been a jealousy between artists as a body and the officials of South Kensington as a body, it would seem that we do not require to go any further than this for the discovery of the reason. If the Government schools ignore, or are inclined to ignore, the principles of design, a separation from such as are professors of those principles through the life-long study of them and of their noblest traditions could not by any chance be avoided, and less perhaps in England than anywhere else.

We may take it, therefore, that in effect there has been for many years a subdued but still persistent desire on the part of the artistic world properly so called to see the schools of design change front. Drawing, it has been said a thousand times, is all very well so far as it goes, but it goes only a little way towards the art of design. No doubt without it a man is without the very alphabet of design; but with it, and nothing more, he has language and nothing more. Given the fancy, it may be replied, and what else can be wanted but the medium of expression? And supposing fancy to be absent, what more need be said? This argument, however, is not only much less conclusive than it seems, but it is almost a play upon words. Whether design can or cannot be taught is a question that need not be argued any more; fancy is a question of degree, and so is design. In its common form, design, proceeding perhaps upon only a small measure of fancy, if it cannot be taught in one sense, can certainly be acquired in another, and the way to acquire it is to study its practice on the basis of its principles.

If England, then, is to aim at a rivalry with France, Belgium, and Italy, in the practice of applied grace, the superficial must be much more supplemented by the substantial, and the mere language of drawing must be more subordinated to the underlying thought. Strange to say, it is almost exclusively in architectural work that this is at present done. In that art, even in a humble form, the learner is obliged to be taught that, without a knowledge of the construction of a building, the superficial configuration of it is but a mockery. In England, we may add, this is almost better understood than on the Continent; our articulation of building design, when at its best, is more complete. Every other kind of decorative art, also, has its own articulation, and a school of design is a school of this. A school of drawing is a school—and may be a very good one—of the language which it is necessary previously to acquire for its expression; but we cannot stop short at mere language. Our schools of design, in a word, must be made technical schools, or they will soon be left behind.

#### THE "NAPOLEON" OF MEISSONIER: A STUDY OF PICTORIAL POETRY AND PROSE.

"I AM broad, I am broad," the Iron Duke repeated to Mr. LESLIE when giving a sitting for his portrait in the *Coronation of Her Majesty*. He appears to have been as ready to indicate the same exceptional proportion to CHANTREY, for it is certainly fully rendered in the equestrian statue in front of the Royal Exchange. To Sir THOMAS LAWRENCE he said:—"It is my habit to stand equally on both legs at once, and it is my wish to be represented so." The Duke, therefore, did his best to secure to posterity a conception of his personality that should be accurate in some principal characteristics; and it was probably only due to a private theory of the painter as to proportions susceptible of dignity or beauty, and to no injunctions of his own, if the profile and prominence of his nose are found to lack such emphasis in the picture as they asserted for themselves in real life, by being foreshortened in directly full-front presentation. We are not aware of any cautions or suggestions having been given by NAPOLEON to the artists to whom it was permitted—if to any—to make studies directly from the life; there was so much beauty in his features that management for the purpose of suppression was not required, and the characteristic expression of supreme self-contained command which was required to harmonise with his habitual attitude before the French nation—that nation which, whether or not, as his testament affirmed, he loved so well, at least he understood so well—was too notorious to need insisting on. The portrait, full-length, which represents

him at Malmaison, is said to be the most truthful to nature, and it corresponds with the accounts of the exceptional shortness of his legs in proportion to his body. That the portraits should not betray the fact that he was short of stature is not surprising. If WELLINGTON wished to be represented at least as broad across the chest as he actually was, less eminent men are seldom careful to make a point of not being exhibited taller and of more liberal bulk than they are entitled to. Not only photographers, with their fictitious upholstery for the benefit of the undersized, but painters also, are often chargeable with keeping out of sight that truthfulness of relative proportion even to column and curtain, to volume or despatch-box or door-step, that would enable the spectator to appreciate magnitude and mass of their subject by a legitimate scale. The artists of our day have to take thought of the existence of permanent photography, which, with merciless justice, as far as features are concerned, will deposit in historic archives the prosaic facts which genius cannot safely ignore even when venturing on its most daring attempts to render them as poetic. We have no such testimony to confront with the counterfeit presentments of NAPOLEON—except, indeed, the cast from his face after death—and, literary evidence apart, might rest upon a Napoleonic legend in art as extravagant as that which is rampant in the "History of the Consulate and the Empire." Should we be very great sufferers thereby? Artistically, it may be doubted. A succession of portraits by various hands and at frequent intervals indicate the most marked changes of appearance of NAPOLEON, from the General of the Directory to the First Consul, the Consul for life, the Emperor, the exile. It is for imagination—imagination exercising its most legitimate function—to impart to any one of these the expression which no photograph could ever have caught—the expression which embodies the very spirit of a prolonged tension of the faculties, of confidence in empire absolutely founded and destined to constant expansion, and of sense of an impending or a consummated crisis.

The small picture by MEISSONIER, which has recently been sold for the price of what was once thought an estate, represented NAPOLEON on horseback, with suite and troops just visible, as he appeared—as he might be supposed to have appeared—in his last fatal and brief campaign of 1815. The sentiment of the picture was entirely obliterated by the critics, who opened pretentious appreciations of it with the blunder of interchanging a quadruped and a battle-field; and, instead of NAPOLEON on his horse "Marengo," saw in it NAPOLEON—the youthful NAPOLEON—at the battle of Marengo. Very differently indeed was the aspect of the *grand homme* to be realised years after. His long locks had shortened and had thinned; the tone of his muscles was relaxed—his face even suggestive of the flabby; the faintly-olive complexion unhealthily yellowish in its paleness; and care, and even depression, were on their way to hold their own in its expression against self-reliance, alert observation, and concentrated reflection. But in the picture is still given an expression of dignity—of dignity sufficient to impress us that his type is not yet that of an exhausted volcano, but of a volcano which has in reserve the elements of a terrific explosion, even if it must be the last. The noble horse, seen almost from the front, implies the still subsisting energy of its rider, to whose pose and attitude it gives elevation.

But now what of the reality? Thiers, who writes his History of the Consulate and the Empire with constant crackle and sparkle, as if himself a link in the electric circuit which had its origin in the marvellous endowments of BONAPARTE, gives a sketch of the successive stages of his combined physical and mental developments, a sketch which lends itself to some of the artifices by which the pictorial is heightened to the ideal. He says that—

NAPOLEON originally was spare, taciturn, and even in youth gloomy—gloomy from that suppressed ambition which preys upon itself till the time that it bursts forth and achieves the object of its desires; by degrees, as he acquired confidence in himself, he exhibited the positiveness of a young man, while all the time continuing morose. Then, as admiration began to declare itself about him, he appeared more open and placid; he became a talker, lost his characteristic spareness, and in a word widened out.

As Consul for life, Emperor, victor of Marengo and Austerlitz, he no longer very much controlled himself, but still did control himself; at this time he appeared at the apogee of his character, and being but moderately stout, he was radiant with a regular and masculine style of beauty.

After that, as he saw nations submit to him and sovereigns humble themselves, he no longer maintained regard either for man

or for nature; he dared all, undertook all; he became gay, familiar, unrestrained in language—expanded fully physically and mentally; he acquired an excessive *embonpoint*, which nowise diminished his Olympian beauty, maintained with his enlarged face his glance of fire, and if from those elevations where men were used to see him, admire him, fear him, hate him, he descended to be a joker, familiar, almost vulgar, he regained them as suddenly after having descended for an instant, knowing well how to lay aside his superiority without compromising it.

When at last it might be believed that he had declined in activity or adventurousness, because his body seemed to encumber him, or because Fortune no longer smiled upon him, he sprang with more impetuosity than ever on his battle horse, giving proof that for his ardent soul matter was destitute of weight, and misfortune of the power of crushing.

This description manifestly degenerates into fine writing at last, but it does so not without a rhetorical purpose, if history a little suffers. It is a point of honour with THIERS never to make an admission to the discredit of his hero, unless to gain credit on the strength of such candour for some extravagant exaggeration in his favour. The admissions and exaggerations are here curiously intermingled, and we are left to realise as best we can the fiery glance on the flabby face of an over-fat Olympian as he vaults on his war-horse with an activity that is above having regard to the law of gravitation. Such vagaries of an historian may furnish suggestions for a caricature, but scarcely to a painter for an heroic ideal of a hero struggling with combined infirmities and consciousness of declining fortune.

The Baron D'ODELEBEN, in his account of the persistently unfortunate campaign of NAPOLEON in Saxony in 1813—written throughout with marvellous freedom from either malice or extenuation—gives an account of NAPOLEON'S horsemanship—and he was constantly near him—which suggests that THIERS only speaks figuratively of the spring on to the war-horse. NAPOLEON, he says, was but badly mounted for an emperor; of the eight or nine horses reserved for his use many officers would have been ashamed to mount any but one Arab. He was but a poor horseman—had, among other irregularities, that of holding his reins in his right hand—and had so little command of his horse that it behoved those who unwarily approached him mounted on mares to look out for their own safety in their saddles. With regard to his personal appearance "at this time, when during a battle or on the march, he came into a group with the King of Naples, MURAT—the *beau sabreur*—the contrast was so striking that it was difficult to abstain from laughter."

Whatever may be the case with intelligent authors and readers, the artist who has to give in effect "the very age and body of the time, its form and pressure," can but be thankful for authentic records of the costume as of the personal characteristics of the great figures of history. How precisely the same artist cares, or ought to care, to adhere throughout to the specifications must depend on the extent to which they are by accident notorious, and in consequence indispensable, and then on their susceptibility of being made subservient or conducive to the expression of moral characteristics of an incident or an epoch. Mere costume, though accurate to the last button, will not revive the impression of the manners of a man or of a period, and much less will it suffice to reproduce character and do duty for sentiment. When it is relied on exclusively, or even disproportionately, the painter, whose best resources should come from the creative faculty within, sinks into a mere costumier; at best he takes up the position of an ill-controlled scene-painter who obtrudes himself on an audience hungering for SHAKESPEARE himself, and who obscures the poetry to which it should have been his noblest triumph to have succeeded in lending some entirely secondary enhancement. Such is not what is seen in the pathetic work of MEISSONIER. The conqueror of banded Europe in a hundred fights was marked at once by his habitual uniform and hat and riding-coat, and if he sat a better horse with better dignity than chroniclers avouch, this was an artistic concession, like the moderation of his advancing unwieldiness to the awful aspect of a moral collapse, which could make all such drawbacks to dignity as unobserved as insignificant. But the entire moral of that marvellous story of unexampled mental and physical energy and resources, at last on the brink of exhaustion and of defeat by such a coalition as nothing less than such an ambition could ever have provoked into combination, is written legibly by the painter in the outlines of the face, the complexion, and the fixity of glance of the Emperor,

inevitably on the verge of becoming conscious that, interpose what obstacle he might for a time, he must soon be fatally at bay.

### EGYPTIAN ANTIQUITIES.\*

ONE of the earliest accounts of the discoveries at Dair-el-Bahari described the amazement of BRUGSCH Pasha when he first entered the subterranean gallery. For several minutes, it was said, he remained in silent awe, overpowered by the sight, and unable to do anything but gaze at the magnificent cases containing the mummies of so many of Egypt's kings and queens, with the papyri, statues, and other treasures. No stronger testimony could be adduced to suggest the value of the discoveries. There must have been something extraordinary in the collection which was capable of overcoming an Egyptologist possessed of so much knowledge as the Director of the Boulak Museum. There is often at first much exaggeration about the importance of archæological discoveries, but the objects found at Dair-el-Bahari have stood the test of scrutiny, and no savant will hesitate to admit that they enlarge our knowledge of ancient Egyptian life, and more especially of the relations subsisting between the omnipotent priesthood and the laity.

It is, however, a remarkable circumstance that the discovery of the Dair-el-Bahari treasure will not be associated with the name of any explorer. BELZONI, RÜPPELL, CHAMPOLLION, WILKINSON, SALT, and others, who worked in the district about the "Northern Convent," have gained fame, and their spirits need not be troubled because one tomb was overlooked; but later explorers have reason to grumble against their ill-luck. Mr. VILLIERS STUART was very nearly securing a prize which would make his name immortal. He says that five years ago he was convinced of the existence of a reservoir of eighteenth dynasty objects. It was known only to a couple of Arabs at Thebes, and the two were actually in his service as guides in 1878-9. If they had given him a hint there would be not only the gain to Mr. STUART, but many articles which are now dispersed might have been secured. The treasures must have a greater interest for him than for most men, and Mr. VILLIERS STUART has accordingly supplemented his valuable "Nile Gleanings" by a description of the latest additions to the Boulak Museum. From his knowledge of the subject he is able to make the book a disquisition upon Egyptology.

The tombs at Dair-el-Bahari for some [unknown reason were liable to invasion. WILKINSON, when speaking of what is known as *Belzoni's Tomb*, says that the deviations in the direction of it and the steep descent are "admirably calculated to mislead, or at least to check the search of the curious and the spoiler." The tomb which is described by Mr. STUART is also difficult of access. There is a narrow shaft, with corridors running right and left, and which, unlike those in other places, are without sculpture or painting. It was in those corridors that the treasures were found, and they consisted of "about forty mummies of kings, queens, princes, and princesses of the 17th, 18th, 19th, and 20th dynasties, together with about 6,000 articles belonging to their sepulchral furniture and equipment. Amongst the miscellaneous articles were statuettes, boxes and caskets, vases, goblets, articles of wearing apparel, papyri, &c." One of the mummies was that of THOTMES III., who is supposed to have lived 200 years before the birth of MOSES, but when it was opened the features crumbled to dust, to the great remorse of the Director. The flowers wreathing the body were well preserved, and a wasp, which had been attracted by them three thousand years back, was dried up, but still perfect.

One of the objects found in the tomb was a canopy or tent which had been used at the funeral of Queen ISI-EM-KHEB. This is described at great length by Mr. VILLIERS STUART, and from his measurements geometrical drawings are given, and a large chromo-lithograph, one-sixth the size of the original, showing all the colours. An extract will suggest the character of this unique work:—

The tent itself may be described as a mosaic of leather work, consisting of thousands of pieces of gazelle hide, stitched together with thread of colours to match. The edges are neatly bound with pink cord of twisted leather, sewn on with stout pink thread; each colour is a separate piece, no one section bearing

\* "The Funeral Tent of an Egyptian Queen, together with the latest information regarding other Monuments and Discoveries." By Villiers Stuart, of Dromana, M.P. With numerous illustrations. John Murray.

two colours; thus each square of the chessboard-patterned footstool, upon which the gazelles are kneeling, is a distinct morsel stitched to its neighbours. The whole work is, in fact, a mosaic, and is the only example yet discovered of what may be called ancient Egyptian tapestry. The colours consist of bright pink, deep golden yellow, pale primrose, bluish-green, and pale blue. They are wonderfully well preserved, considering that they were laid on not long after the Trojan war, and are contemporary with SOLOMON. Much of the surface still retains a gloss similar to that of a kid glove; the pink, yellow, and green have not faded at all, though dulled to some extent by the dust of ages. . . . The canopy consists of a great central panel, 9 feet long and 6 feet wide, divided into two equal sections. One is covered with pink and yellow rosettes on a blue ground; the other displays six vultures, each surmounted by a hieroglyphic text, and divided from its neighbour by a row of pink rosettes on a yellow ground. At either side is a flap divided from the central section by four bands of colours—blue, red, yellow, and green; and further ornamented with a border of spear-head pattern. Below this comes a row of panels containing various emblematical devices, and below that again is a chessboard pattern of pink and green squares, bordered at bottom with a broad belt of pink. At both ends are flaps presenting the same arrangement of chequers when spread out flat. The entire fabric measures 22 feet 6 inches in length and 19 feet 6 inches in width, and covers a space of 201 square feet of leather.

The canopy was employed to cover the shrine of the queen when conveyed in the funeral boat to Thebes—a scene which will recall a picture by Mr. BRIDGMAN in the Royal Academy Exhibition of last year. Mr. VILLIERS STUART explains the details in order; and as the different figures had a symbolical meaning, the pall becomes a sort of key to the religious system of the Egyptians. Thus, for example, the cartouche within an oval border represents the king's signet-ring used for stamping, and suggests that life would be again stamped upon the remains of the queen. The scarab is the emblem of life out of death; the vultures with outstretched wings indicate that the heavenly powers protected the queen against evil; the blue ground is the vault of heaven. Concerning the meaning of the figures of the ducklings (two are placed back to back to form a conventional symbol), Mr. VILLIERS STUART is uncertain, for the device was before unknown; but he supposes that, like so many other figures, it is a symbol of the renewal of life. In one of the inscriptions, "ISI-EM-KHEB" is said to be "Queen of the Land of the Papyrus and the Lotus," and this gives an opportunity for the author to explain the reasons for the estimation in which those plants were held by the Egyptian. In describing the lotus, which so often appears in the paintings, he writes:—

The lotus grows abundantly on the Delta. It is its most characteristic water-plant, has large handsome blossoms and graceful buds and an edible fruit, and was well fitted for an emblem of Northern Egypt. The difference between the lotus and the common water-lily is that the latter has round petals like rose leaves, whereas the petals of the lotus are sharply pointed, and the flower, instead of floating on the water, rises erect a foot or more above its surface. It acquired additional importance because there were scarcely any other wild flowers in that region, and the Egyptians were evidently fond of flowers. We laugh at the æsthetics of our own day, but they are by no means a new invention. "We smell lilies" might well have been said of the ancient subjects of the PHARAOHS, for they are everlastingly depicted on the monuments seated on stools at their feasts and sniffing the lotus. It is no doubt from these tableaux that the name lotus-eaters was given them by HOMER, HERODOTUS, and other Greek writers. We learn from the wall-paintings that in ancient times the blue and pink lotus of India grew either spontaneously or as a cultivated plant, as well as the ordinary white variety. The edible portions of all of them are the seeds or beans contained in the cup-shaped seed-pod; they have a nut-like flavour, and can be eaten either raw or boiled, or ground into meal and made into cakes. It is curious that to this day the Japanese regard the lotus as a sacred plant, and offer it to their gods as the Egyptians did of old.

The second part of Mr. VILLIERS STUART'S volume describes a late visit to the pyramids of Dashoor, Meidoum, and Sak-karah. He considers the brick pyramids of Dashoor to be of the most remote date. It was conjectured that either at Dashoor or at Fyoom was the tomb in which the first arch was constructed, and which bore the famous inscription, "Compare me not to the pyramids of stone, which I excel as much as ZEUS surpasses the other gods." In one brick tomb Mr. VILLIERS STUART found a vaulted brick chamber. He says that "the arch is not, strictly speaking, keyed, but the wedged form which the cement naturally and necessarily took between the bricks all round the curved surface answered the same purpose."

In the third part Mr. STUART gives an account of the continuation of the excavations in the tomb of a governor at Thebes, which he discovered in 1879. It belongs to the reigns of AMUNOPH IV. and KHOU-EN-ATEN. One monarch, as represented in the bas-reliefs, is a thorough Egyptian, and is surrounded with Egyptian accessories. The other belongs to some foreign race, and with him are the signs of a new kind of worship. The courtiers wear strange dresses, and have strongly-marked Semitic features. The illustrations of the reliefs have been reproduced from casts, and are very remarkable. It was supposed by scholars that the two monarchs were one and the same person; but if this theory be accepted, it is difficult to know what to make of figures which are so widely opposed. The Semitic courtiers are evidently portraits, and it is a relief to find so much variety in Egypt, for artists were accustomed to adopt a stereotyped cast of features in their representations of kings and nobles.

There is a curious chapter on the language of ancient Egypt, which has been written in support of the theory that there is an affinity between the modern German and the Egyptian languages. Mr. VILLIERS STUART believes "the ancient Egyptians to have been of the so-called Indo-Germanic race, that they migrated from Asia *viâ* the Straits of Bab-el-Mandeb into Africa, sojourned for an unknown period in the region of Africa which adjoins those Straits, and then took possession of the valley of the Nile. They are identified with the Indo-Germanic race by their language, by their features, by their pottery, by their mythological traditions."

The Society for the Preservation of Ancient Buildings might with advantage turn attention to Egypt. The temple at Dair-el-Bahari has been terribly wrecked since 1879, and some of the subjects which were illustrated in Mr. VILLIERS STUART'S "Nile Gleanings" have disappeared. Plates of bas-reliefs are accordingly published as records. One is of the litter of THOTHMES I., which is carried by six slaves; a second is of a caged lion on board a boat. It is often said that the Egyptian figures are little more than conventional, but there were occasional attempts at realism. A figure of THOTHMES II. at Dair-el-Bahari has shoulders so broad that it was concluded the artist had been careless. But on opening the king's coffin it was discovered "that owing to the abnormal breadth of his shoulders the sides of the coffin had to be cut away to enable his corpse to be fitted into it."

Mr. VILLIERS STUART'S book is an important contribution to Egyptology, and gives English readers an opportunity to realise the appearance of things about which much has been written in the newspapers. There are some curious repetitions in the book which are suggestive of haste, and which should be rectified in the next edition.

#### NOTES ON THE HAMILTON SALE.

THE sale of the Hamilton Palace pictures has been watched with jealous anxiety—an anxiety thus far happily appeased. It is true that certain historical portraits in the first instalment of pictures might have been to advantage secured for some one of the national collections, had we not already sufficiently accredited portraits of the same individuals and examples of the same masters. Still, we confess to regret that the beautiful sketch, rather than finished bust study, of the unfortunate *Queen Henrietta Maria* by VANDYKE was let slip. Moreover, the equestrian portrait of *Charles I.*, though only one of many such treatments by VANDYKE, yet was an exceptionally fine example. The *Edward VI.*, being tangibly a copy of the HOLBEIN in the Royal Collection, of course fetched more than its worth, if anything, and need not be lamented; but the small panel of *Lord Seymour* was undoubtedly a fine picture, with full as much internal evidence of HOLBEIN'S hand as many an authenticated work. The delicate drawing of the eyes and mouth were especially characteristic; the manner, too, in which the chain and filigree metal drops to the doublet were painted, also indicated the accurate finesse of the master. Altogether, we are inclined to think that the depreciation of this historic work was an unfortunate accident. The little picture assigned to DE BLÈS, which the directors of the National Gallery bought, was a valuable acquisition as a link in the history of styles.

But whatever may have been the disappointment felt at the result of the first sale as regards the claims of our national collections, ample compensation has been made by last week's work. Mr. BURTON, directly or through others.

became the successful competitor for the choicest pictures in the assemblage—viz., first and foremost, the grand *Assumption of the Madonna*, by BOTTICELLI; *The Adoration of the Magi*, likewise assigned to BOTTICELLI; the two figures of *Vestals*, in monochrome on an agate ground, by MANTEGNA; the *Portrait of a Gentleman*, ascribed to DA VINCI; the *Story of Myrrha*, by GIORGIONE; and the *Christ washing the Disciples' feet*, by TINTORETTO; the sum expended on these six pictures being 10,185*l.* The selection of precisely these pictures for a 'fight' shows the advantage of having a director over our Gallery who is swayed by no mere antiquarian enthusiasm or official adjustment of values. Out of these six noble pictures the great BOTTICELLI has an absolutely unassailable authenticity, but the other work of the master, the DA VINCI portrait, and the GIORGIONE subject picture, are, so far as mere external evidence of authorship is concerned, sufficiently liable to dispute to excite those fine questions of authenticity, of derivative styles and artistic analogies, over which it is the delight of *cognoscenti* and critics to descant and disagree.

The *Assumption of the Virgin*, which has been won for the National Gallery against the competition of M. GAUCHER, acting for the Louvre, is in every way an exceptional picture, and about its origin gathers one of those picturesque chronicles which bring the painter and his time in vivid reality before us, and make the picture eloquent of weighty matters. SANDRO FILIPEPI—or BOTTICELLI, as he was called after his goldsmith master—was a painter of a "distinct faculty," a poet, and delighting, as the many-sided artists of his day were wont to delight, in things of the intellect and the imagination; yet a draughtsman especially able, and gifted with the cunning precision of the goldsmith's craft in which he learnt his art. A student of DANTE and a lover of classic myth, yet in later life a follower of SAVONAROLA, here was the very painter to portray in order due the heavenly hierarchies, and what of high poetry the sacred legends of the Church might suggest. Here was the very man for a patron like MATTEO PALMIERI, himself a writer in *terza rima* of some fantastic *Divina Città*, embodying the wildest notions of Alexandrine philosophy. BOTTICELLI certainly had a commission from this PALMIERI, and some say the patron gave the whole narrative design of the picture; but one can well imagine that the painter would fill up all that might be wanting of poetic consistence; and here we have the vision before us: lily-filled tomb of the VIRGIN and group of Apostles; donor and his wife on one side in pious observance; above, the ascended MADONNA kneeling for the benediction of her Divine Son; and concentric circles of angelic hosts, saints, elders, apostles, cherubim, radiant about the centre glory of the Ineffable. The picture was given as altar-piece to a chapel in the church of San Pietro Maggiore; but evil tongues, jealous of BOTTICELLI, scented heresy in the scheme. Down came ecclesiastical censure; the picture was hidden against hurt of the faithful by a curtain, and the altar interdicted for their prayers. Some say that the PALMIERI poem, "*Divina Città*," was supposed to be embodied in the picture, and the art therefore was redolent of vain and heretical philosophies to priestly minds; some say that BOTTICELLI himself was "suspect," what with his "Commentary" on DANTE (whatever that may have been) and his nineteen designs for the "*Inferno*," not to speak of those sympathies which made him side with the dangerous friar at San Marco.

There are two engraved designs—the one an *Assumption*, the other called *The Preaching of Fra Marco di Monte Santa Maria in Gallo*, attributed by HENRY OTTLEY to BOTTICELLI, which are interesting in connection with this picture. The last of the two, OTTLEY seeks to identify with SANDRO's plate mentioned by VASARI, the *Triumph of the Truth of Fra Girolamo Savonarola*. The internal evidence is strong in favour of this inference. The treatment of the subject shows, beside certain symbolic objects and the figures of the preaching friar and his auditors, the earthly globe, and above it the vault of heaven, in zones wherein are the fixed stars and the planets; above, again, the CHRIST and the MADONNA, seated; beneath, four rows of angels; on either side a central space of glory, which is encircled by cherubim. Of course, all this mystic imagery was an outcome of the immature science, speculative philosophy, pagan tastes, and spiritual yearnings which held men's minds in strange turmoil in those days of the Renaissance; it was not peculiar to BOTTICELLI. But the rapture and the artistic splendour with which he clothes the thoughts are his. This PALMIERI picture, as we view it by the light of its story and the associations that story

brings up, becomes doubly precious, not only as a noble work by the imaginative Tuscan master, but as visible embodiment of a characteristic attitude and temper of his time.

## INDUSTRIAL ART EXHIBITION AT LILLE.

LILLE, formerly L'Isle, the old capital of French Flanders, and now the chief town of the department of the Nord, is strongly fortified, and possesses, on the Deule, a citadel which is the *chef-d'œuvre* of Vauban. Since the new quarters have been added to the town the population has rapidly increased, and now numbers about 163,000. The avenues, boulevards, and squares of the new town make the visitor almost fancy he is in Paris, while several of the older buildings are quaint and interesting. The Porte de Paris, which formed part of the old fortifications, has been preserved on account of its monumental value: it is a triumphal arch erected in honour of Louis XIV., and is adorned with statues of *Mars* and *Hercules*. The Hôtel de Ville, built in 1846, in the Renaissance style, contains a museum of painting and another of design, both of which are valuable. The Church of Notre Dame de la Treille was begun in 1855, according to the designs of Messrs. Clutton and Burges. The Gothic Church of St. Catherine possesses a painting by Rubens, *The Martyrdom of Saint Catherine*, but it is unfortunately placed in a bad light.

M. Charles Rameau, a distinguished horticulturist, left his whole fortune to the municipality for the erection of a building to serve for annual horticultural exhibitions, and on June 22, 1879, the Palais Rameau was duly inaugurated. The building is of red brick and freestone, in the Italian style, and was designed by MM. Mouron and Contamine, architects, of Lille. With a light iron roof, and well lighted both by lanterns and lateral windows, it is admirably adapted to its purpose, the principal hall having an area of 2,000 square metres. When used for exhibitions of painting, some modifications are required; and the architects ingeniously employ the rings in the roof, from which depend the baskets of ferns and orchids of the flower shows, for fixing the partitions that receive the paintings.

It is this building which is used for the Exhibition of Industrial Art which is now being held under the auspices of the Mayor and Corporation, with the assistance of the vice-president of the Archæological Museum. There are only five classes: building, furniture, textile fabrics and hangings, jewellery, and the almost necessary class in an exhibition of "miscellaneous." Although small, not numbering quite 300 exhibitors, this is a highly artistic and tastefully-arranged exhibition, the *coup d'œil* on entering being really charming. A capital idea has been carried out in the issue of a large-paper edition of the catalogue, illustrated by photographs of the principal exhibits. As this is sold at by no means a prohibitive price, visitors will be enabled to preserve a *souvenir* of some veritable art treasures. The Exhibition is international; but there are few other than French and Belgian exhibitors, and only two English—viz., Messrs. Doulton and Messrs. Minton, though Maw's encaustic tiles are also represented.

The first section, "Building," includes ornaments in stone, marble, wood and metals, mosaics, and art ironwork. These chiefly take the form of mantelpieces, staircases, street doors—the *porte-cochère* in carved oak, elaborately furnished with handles, hinges, escutcheons, and knockers—flooring tiles, and candelabra. Defrennes Frères, of Lille, send four mantelpieces, including one in white marble with caryatides, which is of exceedingly chaste design. Rests for one hand, right or left, while the other is engaged in making up the fire, are ingeniously incorporated into the composition, as brass handles like those introduced into the carved oak mantelpiece of H. Chantry, Lille, would be out of character. A Louis XV. mantelpiece in white marble, by Destresbecq, Tourcoing, merits notice; and another, Renaissance, in black marble ornamented with brass and copper, by L. Evraud, of Brussels, is most effective. The same exhibitor contributes a black and green marble *cheminée* to the Cloetens *salon*, and another in Carrara marble of Louis XVI. style. Messrs. Gauthier Lestienne et Cie. send a mantelpiece and two vases—the designs of M. Boucneau, of Brussels—roughly executed in the blue stone of Soignies, but which nevertheless are highly effective. The last-named sends a classical composition of the same character in white marble, with yellow Sienna marble columns and inlaid work. Two handsome Louis XIII. *cheminées*, executed in fine white stone, with sculptures by Leplat, the designs by A. Newnham, architect, Lille, are shown by Deliens-Levasseur, of the same place. Adjoining them are some columns and a portion of staircase in artificial stone, exhibited by D. Delgutte, of Lille. Part is made to resemble marble, while the remainder has the appearance of freestone; but so good is the imitation that it does not at all suffer from being arranged side by side with the real stone. He undertakes to execute a staircase without joints and warrant it for a year. Some panels in imitation of wood and marble by Bontillier-Robert, of St. Valéry, have a very good general appearance, but are placed too high up to be examined minutely. M. H. Cabre, Pont-à-Marcq, sends some flooring tiles of natural cement, black, white, red, and yellow, which form an effective pattern. M. A. Dapsens, of Vaulxur-Tournai, sends

some tiles in compressed cement, with half-tones that would well suit the present taste, and also some excellent bricks of the same, both burnt and unburnt. The tiles of the same substance shown by Fiévé & Co., Ghent, are in bright colours. Utzschneider-Jaunez & Co. have laid down a plain but handsome floor in black, dark and light brown and yellow tiles. M. Emile Rouze, contractor, Lille, has brought together an interesting collection of specimens of the various building-stones used by him since 1860, including so-called Caen stone, Sampan's *rouge antique* and granite, and Damparis stone, which has a very fine grain and pleasing warm tint. He has also carried out a composition of Messieurs. Contamine & Liagre, which consists of one side of a room in panelled oak, decorated with old China plates and decorative chimneypiece in Norley stone. Chief amongst the parquetry floors must be mentioned those of the Société Franco-Belge de Construction Industrielle, Brussels, who show various specimens of such floors, including that at the King's Palace, Brussels, and also one side of a saloon executed in art joinery-work. A handsome monumental staircase in black hammered iron, the design embracing scroll-work interspersed with flowers, fruit, and oak-leaves, relieved by polished steel and copper is shown, by Wanters-Koeckx, of Brussels. A lustre and pair of candelabra, by the same exhibitors, are handsome in black iron and nickel ornaments; while in a *jardinière* some China asters are marvellously wrought in iron. J. Verhoogen, also of Brussels, shows an imposing iron gateway for a château, with mediæval bell-pulls, &c. M. A. Seidel, of Calais, exhibits a hollow-moulded cast-iron cill for casement windows, which makes a tight joint, intercepting the draught, and also serves as a gutter for taking off the rain outside and the condensed breath inside. To bring our notice of the building exhibits to a close, it remains to speak of the metallised cloth of M. Hautrive, of Lille, for roofing, flooring, and lining damp walls. It resembles tarpaulin, but is impregnated or coated with metallic lead, and is claimed to be impermeable to water, unoxidable by the air, non-conductive of heat, unflammable, agreeable to the view, lighter than any other roof substance, and easily laid. It is fixed by being nailed to laths, and any joints are made water-tight with cement.

Section II., "Furniture," includes cabinet-work, ivories, bronzes, ceramic ware, glass, crystal, painting on glass, and decorative paintings. M. Leopold Demeuter, of Brussels, has constructed a dining and a drawing room, fitted with furniture of different styles. The floor of the dining-room is covered with a carpet of the Brussels type, but of a uniform maroon tint without pattern. The panels of the dado are covered with a cloth woven to imitate tapestry; and the walls above are stretched in panels, with thick twilled silk of deep crimson, the upper part hanging slightly in festoons, surmounted by a kind of vallance of worked velvet. The cornice is of embossed leather and plush, and the hangings are of olive-green satin and brown velvet. The walls of the dining-room are of carved and inlaid walnut, filled in with panels of cloth painted in imitation of old tapestry; and the ceiling is framed to match, leaving white panels. The window curtains are loosely woven in cotton, and though of highly artistic design, cost only 35 francs the pair. M. P. Cloetens, of Brussels, has put up a drawing-room in modern Renaissance style, with console, mirror, and frame of imitation ebony, relieved by polished brass, producing a most striking effect. Some handsome mouldings, in imitation of bronze and polished brass, for the decoration of rooms and picture-frames, are contributed by M. A. Chevalier, of Lille. Signor Adriano Brambilla, of Milan, shows a most artistic ebony cabinet of the sixteenth century, a table, chair, &c., with designs on hawking subjects produced by inlaid ivory, pearl, silver, brass, and copper. MM. Buisne, Rigot et Fils, Lille, make a grand display, chiefly of ecclesiastical art. There is a high altar of the twelfth century, in polychrome oak, for the cathedral of Aire in Les Landes; a fifteenth-century altar, carved in oak of the natural colour; bas-reliefs, lectern, &c., of the twelfth century, for a convent in England; and a bas-relief in white marble, representing the Last Supper, for a church in Lille. M. Gorgers, of Louvain, who has gained medals in London and Dublin, contributes an elaborately-carved Gothic pulpit in oak of the natural colour, of exceedingly pure design, with several figures. The Compagnie des Bois Sculptés, Paris, show a walnut frame and mouldings, and a pair of bellows, in lemon-wood, carved by a mechanical process. Two sumptuous billiard-tables, one ebony inlaid with ivory and the other black and gold, are sent by M. C. Toulet, Brussels, both being fitted with a patent marker, which rings a bell each time it is moved.

In Class V., "Miscellaneous," which includes the original works of artists for serving as patterns for industrial reproduction, we must mention two exhibits. M. H. Leys, of Brussels, shows his art lithographs, and also his journal, "L'Emulation," with working drawings of architectural subjects. M. E. A. Jarder, of Lille, shows a new drawing-board, with panel for stretching the paper secured by iron bars, a cheap pantograph and other drawing appliances, and an arrangement for simplifying perspective drawing. The other classes merit attention, but hardly come within the scope of this journal.

To those who wish to pay Lille a visit this summer we may say that an agreeable way of getting there is by the General

Steam Navigation Company's boats to Boulogne, and then by rail to Lille, the first half of the journey being picturesque, until the dead level of Flanders is reached.

## THE SHIELD OF ACHILLES.

AN occasional correspondent of the *Glasgow Herald* has sent the following account of an interesting Roman fragment:—"Imperious Cæsar, dead and turn'd to clay, might," in this transformed state, as Hamlet says, "stop a hole to keep the wind away"; but the Shield of Achilles, in stone, used as building material, furnishes a striking example of a return to "base uses." Yet such is the case. During the demolition of a wall in the Piazza di Termini at Rome a fragment of a disc in *palombino* marble was found, and on close inspection it was seen to be covered with the several scenes which Homer describes as carved on the Shield of Achilles. Such a subject has never before been met with in remains or monuments of antiquity. In this respect the fragment of close-grained, cream-coloured *palombino* stands alone. It has, besides, a special interest at the present time, when public attention has been so vividly awakened to Homeric legends by the marvellous discoveries of Dr. Schliemann at Mycenæ and Hissarlik. Although the newly-found fragment is considerably damaged from the use to which it was applied in a thoughtless and ignorant age, yet the story it contains and the figures carved upon it are sufficiently evident.

At a recent sitting of the Roman Pontifical Accademia of Archæology—for the Pope's party pursue their studies in this science as well as the Government party—the Advocate Giuseppe Gatti exhibited this illustrated page of ancient legendary lore; and, having read a dissertation upon it, he handed it over in gift to the Municipality to be placed in the Capitoline Museum, alongside the well-known Iliac Table in the Hall of the Doves. Most visitors to Rome must have observed that triangular fragment of *palombino* marble on which, as Mr. Wood writes, "are sculptured in various groups of very minute figures the principal events of the Trojan War as described in the Iliad of Homer. To each group is attached a Greek inscription explaining the incident represented." And Braun describes the style of work as "a medium between vase-painting and gem-engraving." The historical and artistic value of the Iliac Table is shown by the same writer, who says:—"The artist who connected this series of pictures has not apparently intended to exhibit the creations of his own fancy, but seems to have made it his object to bring together the most celebrated works of art treating of the subject in question, whereby a greater interest is imparted to the whole, and its value, in many cases of doubtful interpretation, is greatly increased." And Ampère, who calls this table a "speaking index—*Index parlant*," asserts that it was offered to young Romans as a visible summary of the Trojan War to be used in school as illustrative of the Iliad or the Cyclic poems. The new treasure-trove is easily recognisable, both in material and character, as belonging to the illustrations on stone furnished to studious Roman youths. A people who engraved the ground plan of their city—its temples, basilicas, baths, forums, and streets—on enduring marble might easily illustrate the poems they studied on blocks of *palombino*.

The pictures in low bas-relief on the upper surface of this marble fragment, which is slightly convex, are separated into two plans or divisions. Between these plans is a tiny scroll or belt bearing an inscription that tells the nature of the work and the name of its author, the Shield of Achilles, by Theodore. In the thickness of the stone, polished expressly for this purpose, was engraved, in exceedingly small characters, the whole passage in Homer which refers to the subject, from line or verse 483 to 607 of the 18th Book of the Iliad. On account of a break in the stone the last thirty-nine verses are wanting, but seventy-five verses, arranged in six tiny columns, still remain, though some of these are slightly damaged. They present in many places readings which differ from the received texts; and these variations deserve to be, as they probably will be, diligently studied by philologists. Signor Gatti, who only offered a few general remarks concerning the fragment, awaits a special and detailed description of it by some learned archæologist, and the elucidation of its text by some able Greek scholar.

In his comparison of the several scenes engraved on the fragment with the description of Homer, Signor Gatti showed the exact agreement between the two, in so far as the nature of the work and the restricted space to which it is confined permitted. In the first part of the upper segment of the disc there are fragments of two or three uncertain figures, probably representing the heavens and the earth, the sun, moon, and "the starry lights that heaven's high convex crown'd," as Pope translates the passage in Homer. In the other division are scenes of the peaceful city life, expressed by "sacred pomp and genial feast," and "solemn dance and hymeneal rite." The city is seen completely surrounded by a wall, with towers rising at intervals, and the gate in front. On the same line follows another scene, of which one figure alone is visible, and he is in the act of speaking with eloquent gesture. Here, in all probability, was the delineation of the debate which arose in the Forum on "a townsman slain," and was decided by the "reverend elders" nodding o'er the case "on seats of stone within the sacred place."

In the inferior segment, on the right, the city was represented in a state of war—"two mighty hosts a leagured town embrace." These scenes are now erased; but close to the fracture of the marble a soldier of the besieging army, brandishing a sword, is plainly visible. On the left and beneath this the various phases of agricultural and pastoral life are depicted—"white flocks proceeding o'er the plains." Upon the lower edge of the disc come ploughmen, who guide the oxen and "the shining shares"; others reap "with bended sickles," and others again gather in the vintage, "the purple product of the autumnal year." Here also, over a field towards the centre, are a group of "fair maids and blooming youths" engaged in the "figured dance formed by Dædalean art" for the Cretan queen Ariadne.

In fine, the lengthy description which Homer gives of the "rich various artifice" which "emblazed the field" of the remarkable shield of Achilles formed by Vulcan in obedience to the wish of Thetis is found exactly reproduced on this marble. This, therefore, may be considered as an illustrated page of the Iliad, and especially of one of the noblest and most poetic parts of this sublime epic.

On the reverse of the marble there is a geometrical linear design, somewhat resembling the ground plan of a fortified castle. This figure was divided into 614 tiny squares, each of which contained a single letter—only a small part on the left is wanting. This is a sort of "alphabetical puzzle," for the letters of which it is composed only amount to thirty-one, and they form the words—ΑΣΠΙΣ ΑΧΙΛΛΕΟΥΣ ΘΕΟΔΩΡΙΟΣ ΚΑΘ' ΟΜΗΡΟΝ. These letters are arranged in such a way as to form the same words in whatsoever direction they may be read outwards from the centre as the point of departure. Another remarkable example of this letter and word puzzle is found in the fragment of an Iliac table formerly in the Museum of Verona, and now in the Cabinet of Medals at Paris. Here, in the anterior part, are delineated some scenes from the Iliad, with the indication ΙΛΙΑΣ . . . ; and on the back, in a series of little squares resembling the squares on a chess-board, the single letters of the phrase—ΘΕΟΔΩΡΟΣ Η ΤΕΧΝΗ. In the Iliac table of the Capitoline Museum the first word, the artist's name, has been supplied very sagaciously by Lehrs, and there is no doubt this work should be attributed to a certain Theodore, who represented the facts of the Iliad according to the text of Homer. His work served as a prototype for those who sculptured the Iliac Tables which have been preserved to our day. The title, then, on the present stone discovered at the Piazza di Termini indicates that the Shield of Achilles was delineated upon it, as the composition was imagined by Theodore following as closely as possible the description given by Homer.

It is difficult to assign a date to this fragment. The Capitoline Iliac Table is declared by Ampère to be a Roman work made at Rome. "All that concerned the Trojan origin of this city Rome," he says, "unknown to Homer, and celebrated above all by Stesichorus before Virgil, holds an important position in this bas-relief and dominates in its composition." Seeing that it was found at Bovillæ, where there was a domestic chapel of the Julian family, it is supposed to date from the period of Augustus, or one of his immediate successors. And perhaps the newly-found marble with the Shield of Achilles may have no remoter origin. The fact that it is formed of the same material as the Capitoline Table would lead one to think that the work on both was not separated by a lengthy period.

The name of the artist and the character of the art are decidedly Greek. After the conquest of Greece there was a large immigration of artists, philosophers, and rhetoricians into Rome from the conquered nation. They followed that mute population of statues which the victors bore away as spoils of war. In Rome the artists continued, with doubtful success it must be admitted, to reproduce the types of their gods and goddesses. Probably the Theodore of the tables was one of these Greek artists settled in Rome who busied himself in illustrating, "for the use of schools," the poems and traditions of his native land. With regard to the reproduction, or rather the copying of the works of great artists who had treated the various subjects represented on such tables, the copyists had sufficient material before them. It is believed that parts of the great compositions of Polygnotus at Delphi, and of the pictures of Cleantes, were reproduced in these little slabs of *palombino* marble. The events of the Trojan Wars were sculptured on the pediment of the temple of Juno, near Mycenæ. They were copied at Rome, according to Brunn, in the interior of the portico of Philip by a certain Theon. According to Vitruvius, as quoted by Ampère, the battles of the Iliad and the adventures of Ulysses formed a common household decoration. If the work of this Theodore, whose name is attached to the representation of the Shield of Achilles, was a reproduction, more or less accurate, according to the ability of the artist, of the great works already existing, which had the sanction of time and the acceptance of the people as authority for their faithfulness, it is evident that the recent discovery possesses remarkable interest. In it we see the representation of the manners and customs and modes of living of the ancient Greeks at a comparatively early period, and the philological character of the verses written on this piece of marble, which has yet to be studied and annotated, renders it worthy the attention of scholars.

## THE LATE MR. ROBERT PALGRAVE.

THE death of this gentleman—which sad event occurred at his residence, No. 9 Upper Hamilton Terrace, St. John's Wood, on Monday, the 19th instant—will cause much grief among all who knew him. He was the only son of Mr. Robert Palgrave, of the City of London and Bedford, and was born in the year 1831. He was nephew to Mr. C. F. Palgrave, who was Mayor of Bedford in 1851. He was articled to Messrs. Scott & Moffat, architects, and on leaving their office, he became, for a short time, assistant to an architect at Blackburn, in Lancashire. Returning to London in 1852, he became managing assistant to Messrs. Wehnert & Ashdown, architects, of 42 Charing Cross, now both deceased. Quitting their office in 1857, he commenced practice as an architect at 11 Pall Mall East. His first work was the Clock and Watchmakers' Asylum, at Colney Hatch, which he gained in public competition. In 1857, also, he was appointed architect to the well-known and extensive Britannia Iron Works at Bedford. These works were erected from Mr. Palgrave's designs, and were visited by General Garibaldi during his visit to England. Mr. Palgrave also designed some extensive farm buildings for his uncle, the Mayor, at Liddington; and St. Mary's Wesleyan Chapel, Bedford, and likewise Kempston Chapel, near Bedford, which were erected from his superintendence; as also the Atlas Iron Works, for Messrs. H. Clayton & Co., in the Harrow Road, London, and additions to the residence, at Bedford, of Mr. James Howard, M.P. Indeed, it may almost be said that Mr. Palgrave renovated the town of Bedford, where his chief practice lay, and his works may be seen in all directions. The chief one, however, has yet to be mentioned; this is no other than the rebuilding of the tower and other extensive alterations and additions to the venerable church of St. Paul's, Bedford. It may here be mentioned that great difference of opinion existed amongst the committee at that time for the restoration of this church as to the desirability of entrusting a work of such importance to Mr. Palgrave, even after he had made a number of drawings which were generally approved. So great, however, was the opposition that Mr. G. E. Street was called in to make a plan and a report, which were actually done before that gentleman knew Mr. Palgrave had been employed. It will always redound to Mr. Street's honour that as soon as he was shown Mr. Palgrave's drawings he at once withdrew, and strongly advised the committee to leave the matter unreservedly in Mr. Palgrave's hands. The work therefore proceeded, and the result shows its complete success. It may be stated that Mr. Palgrave was known to Mr. Street, who therefore was not advising the committee to entrust their work in the hands of an *inconnu*.

Of the before-mentioned works, the local guide, "Rambles in Bedfordshire," by Paul Betneys, thus speaks of the erection of the Britannia Iron Works:—"The premises at the 'Barley Mow' gradually became quite unequal to the trade in Bedford ploughs, and some two or three years since it made out quite a morning's walk to call round at the different works. In this hour of need the services of a rising young architect (Mr. Robert Palgrave, of Pall Mall, but himself the son of a Bedford townsman) were called in, and the present extensive and beautifully-planned block of buildings determined on, which for magnificence and utility are perhaps as a manufactory unsurpassed in England."

Of the St. Mary's Wesleyan chapel, Bedford, *The Architect* gave a very complimentary notice at the time of its erection. In 1861 Mr. Palgrave was chosen with a select number of architects to compete for the Agricultural Hall at Islington, and much preference was expressed in favour of his design, and on a division taking place between the drawings of Mr. Palgrave and those of Mr. Peck, the committee were equally divided; the chairman, however, gave his casting vote in favour of Mr. Peck.

Mr. Palgrave soon afterwards left 11 Pall Mall East and took more extensive offices at 2 Westminster Chambers, when he was appointed architect to the Right Hon. Earl Cowper, Lord Lieutenant of Bedfordshire, and for whom he designed and superintended some additions and alterations at Panshanger, Hertfordshire. This may be said to have been Mr. Palgrave's closing work, for, losing his uncle, the mayor, and both his parents about this period, he inherited ample fortunes, and soon afterwards virtually retired from practice.

The writer of this notice, who was associated with him for nearly twenty years, can testify to his sterling worth and his amiable and fair-dealing disposition. He never married, and died aged 51 years. "Reader, if you seek his monument, go to Bedford and look around you." W. F. P.

**A Royal Commission**, consisting of Lord Bramwell, Sir John Coode, Dr. Alexander William Williamson, F.R.S., Mr. Francis S. B. F. de Chaumont, F.R.S., Mr. Thomas Stevenson, M.D., and Mr. James Abernethy, F.R.S., with Mr. W. Pole, F.R.S., as secretary, has been appointed to inquire into and report upon the system under which sewage is discharged into the Thames by the Metropolitan Board of Works, whether any evil effects result therefrom, and, in that case, what measures can be applied for remedying or preventing the same.

## NOTES AND COMMENTS.

THE Paris *Figaro* publishes the statutes of a new "Academy," which MM. EDMOND and JULES DE GONCOURT propose to found. The scheme was prepared twenty years ago, and the private fortunes of the brothers are to serve as the foundation. The Academy will consist of only ten members, who will be named in the will of Mr. EDMOND DE GONCOURT; and all vacancies occurring are to be filled up by election. Each member will receive a life pension of 240*l.*, and an annual prize of 200*l.* will be given for the best work of the year, to be chosen by the Academy. All the members are to be prose writers, and, according to the *Figaro*, among the first ten named will be ALPHONSE DAUDET and EMILE ZOLA, the novelists, and LOUIS VEUILLOT.

M. CLESINGER, the sculptor, has completed the casts of the statues of KLÉBER, HOCHÉ, and CARNOT, which, together with that of MARCEAU, are to be erected in front of the Ecole Militaire. KLÉBER is represented as commanding in action, and, mounted on horseback, he appears with his lifted hand to be waving on his men to the conquest of Egypt; HOCHÉ, the pacificator of La Vendée, holds an olive-branch; while CARNOT is presented in meditative mood, befitting the "organiser of victory."

Two of the great panoramas lately started in Paris have already fallen foul of one another. A pamphlet having been published eulogising that of the *Battle of Champigny*, painted by MM. DETAÏLE and DE NEUVILLE, at the expense of the Reichshoffen Panorama of Messrs. POILLOT and STEPHEN JACOB, the proprietors of the latter entered an action for libel against the printer and publisher, claiming 2,000*l.* damages, and a prohibition to continue the publication. The First Chamber of the Civil Tribunal of the Seine condemned the defendants each to pay 40*l.* damages, to stop the sale of the pamphlet under penalty of 4*l.* fine for every proved infraction of the order, to insert the verdict in three Parisian and six provincial journals, and to post a copy of it at the very doors of the complainant's premises in the Rue St. Honoré.

THE prizes awarded to French exhibitors in this year's Salon were distributed at the Palais de l'Industrie on June 23 by M. FERRY, Minister of Public Instruction and Fine Arts. In the course of his speech the President congratulated the artists on the success they had attained since they had formed themselves into an association, and observed that he hoped they would shortly be able to erect a building of their own, though in the meantime they could count upon the Palais de l'Industrie being annually placed at their disposal. After criticising in general terms the 1882 Salon, and expressing his preference for the classic over the realistic school of painting, M. FERRY concluded by paying a warm compliment to M. PUVIS DE CHAVANNES, the recipient of the Médaille d'Honneur for Painting. After a reply by M. BAILLY, President of the Société des Artistes, the prizes were presented. M. DE CHAVANNES, on coming up to receive the Grand Medal, was enthusiastically applauded. It is stated that on the occasion of the July 14 fête, MM. ROLL, GERVEX, RAPIN, and PILLE, will be decorated with the ribbon of the Legion d'Honneur.

THE French artists who have sent works to the International Fine Arts Exhibition at Vienna, have elected the following as members of the jury to award the prizes in the French section:—Painting, JULES LEFEBVRE and BONNAT; Sculpture, GUILLAUME; Engraving, GAILLARD; Architecture, RUPRICH-ROBERT. These gentlemen will proceed to Vienna at the beginning of August to fulfil their task.

SINCE the Government have introduced an Ancient Monuments Bill, there is some hope that it will become law. Among the works to which it refers are Stonehenge, the Vallum at Abury, Kitz Coty House, Arthur's Round Table, Silbury Hill, and various stone circles in England; forts, cairns, and Pictish towers in Scotland; and earthworks in Ireland. The schedules correspond with those attached to the later Bills introduced by Sir JOHN LUBBOCK. The Commissioners of Works in Great Britain and the Commissioners of Public Works in Ireland are to become the guardians of the monuments; but their duties are not to interfere with the estate, right, title, and interest of an owner in

a monument. The Commissioners may, however, purchase monuments under the Lands Clauses Acts, or the interest of owners may be devised or bequeathed to them. It is proposed to appoint a competent inspector, who will report on the condition of the monuments and the best mode of preserving them. Injury to ancient monuments is to be punished by a fine of not more than five pounds, or imprisonment, with or without hard labour, for a term not exceeding one month. But the owner of a monument is not punishable, except in cases where the Commissioners of Works have been constituted guardians, when the owner shall be deemed to have relinquished his rights of ownership so far as relates to any injury or defacement of such monument, and may be dealt with as if he were not the owner.

OWING to the interest taken by Signor BACCARINI, Italian Minister of Public Works, and one of the most distinguished hydraulic engineers in Italy, the following works of vital importance for Venice have been approved, and will doubtless be carried out with all possible expedition—namely, the removal of the River Brenta from the lagoons; the deepening to 9 mètres of the principal navigation canal from Malamocco to the Arsenal and to Venice; the excavation of the canals at the maritime station; the construction of dykes at the Lido to impede the passage of the sands; and the raising and fortifying of the banks of the principal rivers flowing into the lagoons, to prevent as far as possible the neighbouring country from being inundated.

A RETURN has been prepared which shows the "extraordinary expenditure" of the Belgian Government during the period between the revolution in 1830 and 1881. The erection and restoration of civil buildings have absorbed 100 millions of francs, of which 6 millions were spent on the Royal Palace of Brussels, 9 millions on those of the Parliament and Ministries, 33 millions on the new Palais de Justice; in addition 48 millions have been spent on schools and universities. Fortifications and barracks have taken most of the 231 millions devoted to military purposes. The city of Antwerp has secured a lion's share of the extraordinary expenditure. The fortification and enlargement of the town cost 83 millions; the improvement of the port 49 millions, and new warehouse for goods 5 millions. In all, more than 157 millions of francs have been expended on Antwerp, and it will soon become unrivalled in the world as a fortress and harbour. The canals, rivers, and water-courses of Belgium have already cost 200 millions since 1830; 31 millions are still available, and 12 millions more are now demanded for this purpose, destined chiefly for the Antwerp quays.

THE hearing of the remarkable libel case of BELT v. LAWES, after occupying the Court of Exchequer for seven whole days, has been adjourned until November. It would be difficult to discover a case that was less adapted to be tried by a jury. The jury were not acquainted with the mysteries of a sculptor's studio, and after the second day, when there was no more novelty, they were wearied of the examination. How can it be expected that business men will be able for more than four months to retain a recollection of details, which they did not comprehend? The issue involved is whether the plaintiff is competent to model, and it might have been determined by a couple of experts in the course of a day. But the law does not recognise arbitrators' reports in cases of libel, and, in consequence, several weeks in a public court will be occupied. The probability is that, under the circumstances, the jury will not be able to agree upon a verdict, and, as has often happened before, the litigants have been simply creating profitable work for the lawyers.

LAST week we mentioned that the members of the Architects' Congress visited the Duc d'AUMALE's château at Chantilly, which has been entirely rebuilt since 1872. The new building is rich in art treasures. Among these may be particularly noted the library, one of the finest private collections extant; the Condé Gallery; the chapel, now completely restored; the splendid stables of the Prince de CONDÉ; and the magnificent picture galleries. These, together with the "Psyche" and "Stag" Tribunes in the park, are open to the public on Thursdays and on Sundays from 1 to 5 P.M.

## ILLUSTRATIONS.

AGRICULTURE: A DECORATIVE FRIEZE.

WHEN the world becomes wiser than it has been, people will wonder why for so many generations schools were allowed to present a cheerless aspect. Children are impressionable, and no one can tell how often among them learning has been associated with blank walls, as well as with bodily inconveniences. An ordinary English schoolroom has as little attractiveness about it as a room in a hospital. In some of the great public schools so much is historical and legendary as to render ornament less necessary, and the work of the painter or the sculptor would hardly have equal interest with the names which have been cut on walls and posts by boys who afterwards became famous. But those who are not fortunate to belong to Eton, Rugby, or Westminster, must spend weary hours in rooms which are without any halo of tradition, and where nothing is to be found that will excite the imagination. It is not in England only that dreariness is supposed to be an auxiliary to study. The French secular schools are often not unlike barrack-rooms, and it might be concluded that both kinds of buildings formed a part of the military organisation. But the authorities in France are now recognising the importance of making schoolrooms agreeable to the young. We give this week the first portion of a great frieze which has been painted for one of the public schools in Paris by M. JULES DIDIER. The original was among the attractions of the Salon this year, and will shortly be placed in the position for which it was painted in the building in the Rue Chateau Landon, in one of the most crowded districts of Paris.

No subject could be more appropriate than agriculture to place before the eyes of the children of a great city. It allows of the introduction of forms and colours which are pleasing, and, moreover, it is one which has the advantage of novelty. M. DIDIER does not attempt to make one of those moral pictures which are hateful to the sight of boys; but as he presents nothing but scenes of industry and of cheerful labour, his frieze must exercise a healthy influence on those who have to see it daily.

The illustration we publish is an untouched reproduction of the original by Messrs. SPRAGUE'S ink-photo process, and it may be said that all the strokes of the painter's brush have been preserved. It will be remembered that as the original is a frieze, and consequently will be hung at a distance from the spectator, our illustration must retain some of the characteristics of a painting. It would be unfair to judge it as if it were an engraving composed of fine lines or minute stipples. If placed in the proper position the breadth and vigour of the figures will be apparent.

## THE GLASGOW SCHOOL ACCIDENT.

IN March a play-shed attached to the Pollockshields Board School collapsed, and in consequence four children were killed and nine were seriously injured. The master joiner who in 1878 contracted for the work, his foreman, and the inspector of buildings, with two joiners who in 1881 contracted to remove and re-erect the shed, were last week charged in the Glasgow Circuit Court, before Lord Young, with culpable homicide and culpable neglect and violation of duty.

It was contended on behalf of the two defendants and the inspector who originally erected the shed, that there was no distinct statement in the indictment to show that the fall of the shed was attributable to defects in the wall-plate or in the construction. But even if defects existed they should have been seen by the second contractors, and be rectified by them. If an inferior kind of wood had been used for the wall-plate it was a violation of the contract, and was a subject for civil remedy and not for a criminal remedy. The whole of the indictment against the three defendants amounted to no more than this, that they put up a shed which stood until it was taken down, and in which previous to the re-erection no defect had been discovered. Counsel for the other contractors also submitted that the charge against them was irrelevant.

The Advocate-Depute, for the prosecution, maintained that the accident was due not merely to faults in the re-erection, but to faults in the original joiner-work. It was the duty of the second contractors to see that the work was secure work. They had the choice of two things—either to abandon the work and say they would not do it, or if they undertook it, to see that there was security for the safety of the lieges, and especially of the children attending the school. Such a fault as that complained of was not a fault for which there was civil responsibility, so much as a fault attributable to gross negligence, which was a fair subject of criminal responsibility.

The Dean of Faculty argued that the defendants were entitled to know from the indictment where the insufficiency of the workmanship was, and what it was in the building that gave way. If the charge was to be proven at all, it must be on the footing that certain specific parts of the structure gave way, and that the fault of the prisoners was the cause of it. They were entitled to something more than the statement that the shed "collapsed," which was a very curious expression. It was impossible, he held, for those employed in 1881 to so put up the building as they found it. The whole work done originally was undone. It was not suggested that they had any opportunity of inspecting the work before the other men began to re-erect it, and in the absence of such an opportunity those who originally erected the building surely could not now be held criminally responsible.

Lord Young, in giving judgment as to the question of relevancy, said:—This seems to have been a very sad accident, and it would be satisfactory upon a proper libel to have an investigation into the cause of it. But I can't say this is a proper libel. Indeed, I have hardly ever seen one like it. The case is a peculiar one undoubtedly, and a peculiarity in a case is always a fair explanation of an indictment being out of the common course. But I must say for this indictment that it is uncommonly confused. It is very difficult to pick up from a statement in one sentence that extends to eight printed pages what is exactly alleged against the prisoners individually, and to what exactly the sad accident which happened in March 1882 is attributable. No fewer than four little girls were killed and nine injured—a sad accident indeed. It happened, as I have said, on March 20, 1882. In respect of three of the prisoners, their connection with the shed ceased in 1879, and they had nothing to do with it so far as appears—had not seen it—for nearly three years before the time it fell. They erected the play-shed, which was finished in August 1879, but no part of the work which they did, or which was done under their superintendence, and which was finished in August 1879, existed in point of fact in March 1882. Their work had altogether disappeared, because the work they finished in August 1879 was—subject to an observation which I shall make immediately—taken down and removed in March 1881. The work had disappeared therefore. It may have been very bad, but it served its purpose so long as it was allowed to stand. In March 1881—not quite, but approaching two years after it was erected—it was removed. It is said that a part of the wall-plate was not removed. The indictment is not distinct upon this, and a criminal indictment ought to be very distinct upon everything on which a charge of crime may turn. It is explained that a bit of the wall-plate was not removed—that so much of the material was left standing. But, subject to that observation, all the work which the three prisoners first mentioned in the indictment did disappear in March 1881. It appears that the School Board had it in view to build an enlarged shed, but that their intention was frustrated by the objection of somebody or other, who forbade the contemplated operations. They were evidently averse to litigation, or satisfied that with justice to others their intentions could not be carried out, and so the firm of jobbing joiners they had employed to take down and remove the work of Carmichael, Service, and Andrew were employed to put it back again. They were not employed to find any new material—they were told simply to restore the building as they found it. And this they did in the month of March as jobbing joiners, doing such work as they were employed to do, and not exercising their judgment in the matter. They were told just to put things as they found them, and that they did. Now, I have to consider whether there is here a relevant charge against both or either set of prisoners. The first set of prisoners consisted of those who engaged in the original erection of the shed, and the second set consisted of the two jobbing joiners who were employed to restore the shed. Now, with respect to the first set, I cannot find any ground satisfactory to my own mind for subjecting to a criminal responsibility—which I would do by holding this indictment against them relevant—for the fall of a building those who had erected that building's predecessor. I know of no authority for such a thing. I think there is no reason for it, and therefore with respect to them I am of opinion this indictment is irrelevant. If it had been stated that they were culpable in the way of providing material for this shed, which was of a dangerous character, so that the use of it exposed human life to risk, and that the use of it had led to this accident, I should have been disposed to think that that, at least within reasonable limits with respect to time, might have been a relevant charge; but I am unable to select or excise out of this indictment a point of that kind, so that I cannot upon such a ground hold the indictment relevant with respect to the first three prisoners. With respect to the others, I repeat that they were joiners employed to take down the roof with a view to the enlargement of the shed, and to restore it as they found it—that is to say, just to replace the materials given to them in the position out of which the materials had been taken. I cannot find a relevant charge against them either. They might have so conducted themselves in the matter as to infer culpability and criminal responsibility, but I do not find it stated in this indictment that they did so. It is no doubt stated that the work as they restored it was not sufficient, or that they restored it insufficiently, but then when the indictment is examined, and when

the Advocate-Depute was interrogated by myself as to whether there was any insufficiency except in the fastenings, which he said existed in the predecessor of the roof—a facsimile of which they were asked to restore—it is not said that any such thing is suggested or intended. They were not employed to exercise their judgment in the matter. As I understand the case against them, they would have been responsible if any accident had occurred in consequence of their not replacing things as they found them, as they were told to do. They were not asked to judge of the sufficiency of the materials, or to give advice or judgment as to the supply of these. They were not under any contract to furnish materials themselves, either wall-plate or anything else. They were to take the materials furnished by the School Board and the architect, and to place them in the position in which they found them. And it is said in the indictment that this is precisely what they did do—that the accident, indeed, is attributable to their doing exactly what they were instructed to do. So I cannot find that the libel is relevant in respect to them either. I must say that in March 1881, when the roof was re-erected after it had been standing about two years or nearly so, I am surprised some one was not employed to look to the state of the materials, and to look to the sufficiency of the fastenings. But that does not seem to have been done. It just seems to have been taken for granted that everything would be right if the old materials were replaced in the position in which they had been before, and if affording a bad example to be copied in such circumstances forms a ground of criminal accusation, there would be good grounds for a criminal action against both sets of prisoners. But being of opinion that is not a good charge, I find the charge in respect of the first set of prisoners irrelevant, and, on analogous grounds which I have endeavoured to explain, I find the charge against the second set irrelevant. The result, therefore, is that I find the libel irrelevant. The prisoners were then liberated.

### ARTISANS' DWELLINGS.

THE Select Committee appointed by the House of Commons to consider the working of the Artisans' and Labourers' Dwellings Improvements Acts of 1875 and 1879 have completed their report. The Committee are of opinion that nothing will contribute more to the social, moral, and physical improvement of the working classes than the improvement of the houses and places in which they live. In carrying out such improvements they believe that there is ample room for the operation of all existing agencies—Sir Richard Cross's Acts (1875–1879), Mr. Torrens' Acts (1868–1879), the Public Health and other Sanitary and Local Acts, as well as for private enterprise.

The Committee consider that Sir Richard Cross's Acts, which require that "the improvement scheme shall provide for the accommodation of *at the least* as many persons of the working class as may be displaced," may be relaxed, and that the accommodation to be required should vary from one-half to two-thirds, as the confirming authority may think fit, on the report of the person holding the local inquiry in such case on their behalf. The effect of this relaxation will be not merely greatly to reduce the cost, but it will in many cases enable the Metropolitan Board, in dealing with an unhealthy area, to refrain from pulling down the whole number of the houses, at all events at once, in cases when they may be able to render parts of the area sufficiently healthy by pulling down certain houses only, and so letting in light and air and giving ventilation to the remaining parts.

As there is a large migration of the working classes to the suburbs, it is necessary to facilitate cheap means of locomotion, and to control the condition of the suburban houses. It is therefore recommended—1st. That similar conditions as to workmen's trains within a certain distance from London to those now imposed upon the Great Eastern Railway Company should be enforced in the case of other railways as opportunities may offer. Such an opportunity has just offered in the case of the Regent's Canal Bill. They have strongly recommended this Bill to the notice of the Board of Trade, in consequence of which proper clauses will be inserted on their suggestion. 2nd. That many of the sanitary provisions of the Metropolitan Building Acts be at once extended to the suburbs, under the control of the several local authorities. 3rd. That all existing sanitary legislation should be more fully enforced, especially in those parts of the suburbs where buildings are so rapidly springing up.

The Committee regard the provisions of Mr. Torrens' Acts as most useful, and regret that they have not been more constantly and universally put in force. They would strongly urge upon the vestries and district boards the necessity of putting them fully in force without delay.

The intention of Parliament in sanctioning these statutes was to provide the means whereby local authorities might secure the effectual repair of dilapidated dwellings, or, when necessary, their gradual reconstruction. As the work of bit-by-bit replacement can never cease to be an object of municipal care in over-peopled localities, it was hoped that it would come to be regarded as a constantly recurring duty which, if performed with discrimination, would lead to the permanent improvement and rateable capability

of a district, without aggravating in the process the evils of overcrowding.

The Committee are of opinion that these Acts may be materially improved by allowing the local authority to remove houses, though in themselves in good condition, when by doing so they could open up courts and alleys, and so give the necessary air, light, and ventilation, so as to render such courts or alleys healthy; in which case the owner would be entitled to full compensation, just as much as the owner of premises taken under the 5th section of the Act of 1875 for widening existing approaches to unhealthy areas. In such cases the Committee think that any additional value accruing in consequence to houses adjoining the house so pulled down, should, when they belong to the same owner, be taken into consideration in assessing compensation. The Committee think that the operation of these Acts should not be confined to individual premises, but should be extended to several houses in a street, court, or alley, within the limits of what may be called a mere local as opposed to a metropolitan improvement.

In conclusion, the Committee, while fully alive to the necessity of consolidating the whole of the existing Acts, and of dealing with the other matters alluded to above, are of opinion that—(1) It is desirable that a short Amending Bill of the Acts of 1875–79 should at once be brought into Parliament, and, if possible, passed this session, to carry out so much of the above recommendations as relates to relaxing the Acts in respect of the number of persons for whom accommodation should be provided in all pending or future schemes in the provincial towns as well as in London, and to the doing away with the necessity for a provisional award, and also as to the period after which no compensation should be given for alteration in term or tenure, or for improvement made. (2) It is desirable to amend the Act of 1868, and the Amending Act of 1879, as suggested, without delay. (3) It is also desirable to pass an Act for relaxing the provisions of the Metropolitan Street Improvement Act, 1877 on the points above suggested, and this also, in their opinion, ought to be brought before Parliament, and passed during the present session, and they are also of opinion that the same policy ought to be followed in any future Metropolitan Street Improvement Act. (4) The Committee hope that, if the recommendations they propose to be carried out this session obtain the sanction of Parliament, no time should be lost by the Corporation of the City, by the Metropolitan Board of Works, by the vestries, and by the District Boards of Works, in giving effect to these designs for local improvements. (5) They would recommend the alteration of the Standing Order No. 884 so as to carry out the views indicated in this report, still, however, retaining sufficient safeguards in the interests of the persons to be displaced, in accordance with the general tenor of this report.

### THE CHURCH OF ST. PETER, PETERCHURCH.

A PAPER was read by the Rev. G. M. Metcalfe on the history of Peterchurch at a late meeting of the Woolhope Field Club. He said:—Dedicated to St. Peter, it is mainly of the early Norman style, date about the tenth century. The church consists of apse, double chancel (with once, very probably, a central tower), and nave. These comprise a very unusual and complete church arrangement, and form, without doubt, a most interesting example of this period of architecture. There are two other churches in the county, and not so very far from Peterchurch, which I suppose are of about the same date. I allude to Kilpeck and Moccas; but these are much smaller, and neither of them possesses the double chancel, though there is a common touch in all three which seems to bespeak a common builder; but no other church, so far as I am aware, approaches this in simple outline and character. You will find that the work throughout is plain and massive, with walls about three feet thick. There are few mouldings, and but little ornamentation, except on the middle chancel arch and abacus of the nave archway, and on the font. Externally a little enrichment will be found introduced into the string and heads of the apse windows, and on the head of the south doorway of the nave. The proportions of the plan of the building are very pleasing. The dimensions of the nave are about 53 feet long by 26 feet 6 inches wide; the first chancel (or central tower) a square of about 21 feet, the second chancel being 19 feet by 16 feet, and the apse 17 feet 6 inches wide, struck in with a radius of about 9 feet.

The points of interest are six windows introduced into the walls of later architecture—viz., two of the first Pointed (thirteenth century), one Decorated (fourteenth century), and three Perpendicular (fifteenth century). The priest's doorway in the chancel is also first Pointed, and the nave doorways (north and south) are of the same date as the tower and spire (viz., Decorated).

Placed in front of the apse will be seen the high altar, which is of stone. The top slab is 6 feet 3 inches long by 3 feet wide and 4 inches thick, bevelled on the underside, and it is 32 inches high. On the Gospel and Epistle ends, and in the centre of this slab, there are five incised visible crosses, having reference, I presume, to the five wounds in our Lord's body. The support is of rough rubble stonework. The top stone slab had to be removed during the restoration in 1869–1870, but no relics were discovered.

Probably, then, the altar was erected where a saint's blood was shed, and the church afterwards added to enclose and protect it.

Within about two miles of the church is the ruin of a long-disused chapel adjoining Urishay Castle, and in this chapel is another stone altar precisely similar to the one I have described, and bearing also the five crosses. At Abbey Dore you will also find a stone slab for altar, but *minus* the crosses. The narrow loop-hole windows, with stone steppings, are very curious in the apse and the nave; a wooden table of oak—before the restoration—stood and was used as the Communion table before the stone altar. This is now removed, and placed in the vestry or lower part of the tower.

I remember when I was curate in charge, and before the restoration, the inner chancel or the sacristy was blocked out from view of the congregation, the key-stone of the plaster and rubble, three or four feet thick, was built, and chancel arch had dropped out, and a wall of lath filled up the whole of the archway, a small organ doorway being left in the middle; and this part of the church was only used at the time of the celebration of the Holy Communion. A stranger once helped me, and insisted upon reading the ante-communion service from the stone altar. The old clerk—a son of the Anakims—tried his utmost, from his place in the three-decker, to repeat the responses after the Commandments; but the stranger's voice in the inner chancel was only a hum—in fact, inaudible—and my old friend took off his spectacles, looked piteously round on the congregation, closed his big book with a bang, and said, "It is of no use; I canna' hear him." A decorated piscina will be found in the south wall of the nave to the east.

Over the south doorway is a coloured stone tablet of a fish, a good specimen of a trout, having a gold chain round its neck. Some consider it emblematic of the patron saint and the tribute-money miraculously procured. There is a legend of a fish of unusual dimensions having been caught by one of the churchwardens in the little river Dore, hard by, and that a plaster cast was taken and affixed in the church to commemorate the circumstance. But probably it originally was placed there as the well-known Christian emblem. In the tower are a few tablets and an old stone of some antiquity. The font of stone is very old and ancient—coeval with the period of the church—very singular in form, narrowed in the waist with a rope moulding, such as forms a beading externally round the apse, and which ornament has been cleverly used by the architect in the decoration of the stone pulpit.

Before the restoration two galleries once existed—one in the entrance to the chancel, and which only the men entered, and to which there was access by a circular staircase from the chancel in the way to the roodloft; and the other, which was removed in 1869, was at the west end of the nave, and was a rough structure used as a singing gallery. It had no mediæval interest at all, though relics might perchance once have been exhibited from it. Two other rough modern galleries were also taken down in 1869 in the nave and in the chancel on the north. During the restoration in 1869, and chiefly in the chancel, a very large quantity of human remains were found within two or three inches of the surface of the floor level. They had apparently been buried without ever being encased in coffins, and perhaps had first been hurriedly buried elsewhere. In a hole dug for a single scaffold pole I saw about a dozen skulls alone removed. All these remains were carefully buried again in the churchyard.

The old nave roof was blown down and destroyed by a dreadful storm of wind in 1869. It was of oak. At the restoration it was reproduced exactly in form and shape, but not in oak. There was a porch at the north entrance to the nave, but being in a very dilapidated state, and of no architectural interest, it was removed. The architect, Mr. Edgar Williamis, has an harmonious design ready for a new stone porch when the funds, so much desired, are forthcoming.

The spire and tower are decorated (fourteenth century) and were a short time back in a very ruinous and dangerous condition, but they are now splendidly restored, and the work most admirably carried out and accomplished without an accident. The height of the tower is 80 feet from ground; spire and vane 116 feet. Total height 196 feet. They who remember the church prior to 1869 will bear me out when I say that almost every architectural feature was as good as obliterated. So after the very pleasing result obtained through the care and genius (as yet, I grieve to say, quite unremunerated) of my friend the architect, Mr. Thomas Edgar Williams, of Victoria Street, Westminster, who has devoted much time and zealous care and skill to his work, that utterance of Mr. Ruskin, in his "Letters from Venice," does not apply—if in any, certainly not in this case:—"Of course all restoration is accursed architects' jobbery, and will go on as long as they can get their filthy bread by such business.—J. R., 1877." Some crumbs of comfort, I am sure, may fall to my friend's lot when you gentlemen pass your verdict upon his work.

The "City Press" states that the cost of reclaiming Epping Forest, including arbitration, compensation, and other legal expenses incurred by the Corporation, will approach the sum of 270,000/.

## A MANCHESTER SHIP CANAL.

A MEETING was held on Tuesday at Didsbury, for the purpose of considering a scheme by which the construction of a ship canal from Liverpool to Manchester is proposed. Among those present were the Mayors of Salford, Ashton, Warrington, Macclesfield, Stockport, Rochdale, and Staleybridge.

Mr. Fulton, C.E., described the project. He said it was proposed to straighten, widen, and deepen a portion of the rivers Mersey and Irwell, so as to provide a direct tidal channel of sufficient capacity to allow vessels of the largest draught which now navigate the Suez Canal to reach Manchester. By means of the proposed excavated channel the tide would be brought up to Manchester, and at ordinary spring tides there would be at that place a range or rise of tide from low to high water spring tides of 15 feet, and at high water neap tides 12 feet. The depth at low water at Manchester and where it was proposed to construct a basin would be 22 feet, which, added to 15 feet, the range of high water spring tides, would give a total depth at high water of 37 feet. From Manchester to the sea the minimum depth at high water spring tides would also be 37 feet, or 10 feet more than exists in the Clyde navigation up to Glasgow. At low water spring tides the minimum depth of the channel would be 22 feet, or about 12 feet more water than exists at low water on the bar in the Queen's Channel at the mouth of the Mersey, so that as soon as a vessel on the flood tide had sufficient depth to cross the bar, she would be able to reach about an hour or so later than she could obtain admission into the docks at Liverpool. With regard to the railways which would be interfered with by the proposed channel, they would have to be passed over the proposed navigation by bridges of an increased elevation, or if thought more desirable by swing bridges. The proposed basin at the Manchester terminus would be 8,000 feet long and 700 feet wide, with a depth at high water spring tides of 37 feet and 22 feet at low water, which would accommodate the largest ocean-going vessels and prevent them from grounding. The basin would consist of an area of 128½ acres. The length of quaysage would be about 16,000 lineal feet or more than three miles, and the quays would be provided with sidings, by means of which goods could, by the construction of short connecting links, be transferred to the basin lines of the existing railway companies. The great advantage of the local and central position of Manchester over Liverpool must be borne in mind. The instance of the Clyde navigation was a parallel case, where, from its pre-eminent position, Glasgow had secured nearly the whole of the trade of that important navigation. The surface of the Irwell at a point below Throstle Nest weir was 61 feet above Ordnance datum, the mean level of the sea, and, therefore, in order to allow the tide to flow to the required height, a cutting of a depth of 87 feet to the bottom of the navigation would have to be made at that point. The depth of the deepest cutting on the Suez Canal was 85 feet, and that of the proposed Panama Canal was 315 feet. It was maintained that beside the direct service of the navigation to the commerce of Manchester, it would be a certain means of preventing a recurrence of such damaging floods as those which had occurred of late years, and would occur again if this proposal was not carried out, whenever the rainfall heavy. The straightened, widened, and deepened channel would allow the free outflow of a much larger body of upland water than had ever swelled the Irwell. The descent of the floods into the new channel would be regulated by a series of weirs extending above and below Throstle Nest Weir. The interposition of these weirs would moderate the velocity of the current of the water at its entrance into the new channel, and so diminish the amount of scour which would otherwise take place. The entire length of the proposed channel from Manchester to Liverpool would be 37 miles, of which 19 miles would be excavation or deepening and 18 training. The distance along the present Mersey and Irwell navigation from Manchester to Liverpool was 40 miles; the distance along the original channel was 47 miles. From near Trafford Bridge, Salford, the eastern end of the proposed navigation to Runcorn, the Mersey, after receiving the Irwell, winds so as to make the distance by its natural course about 27 miles. By the plan of the proposed tidal channel, it was intended to use the existing river bed where it was tolerably straight, and to cut off the bends, so as to reduce the length of its course between Trafford Bridge, Salford, and Runcorn, by about nine miles. From near Trafford Bridge the proposed basin would occupy the present bed of the river as far as the commencement of the bend above Mode Wheel Mill, where the new channel would commence, and would be excavated in a nearly direct line, and a portion of the present bed would be filled in. Two smaller bends below and near Eccles would be cut off, and the existing channel used for a short distance below Barton Aqueduct. The same process of straightening would take place all the way to Runcorn, an alternate utilising of the present bed of the river and the cutting off of bends. Means would be taken to preserve the existing wharf accommodation at Warrington, with an increased depth of channel, so that vessels of a large class would be able to reach and lie afloat. Facilities also would be afforded for the construction of docks, if thought expedient. The existing river channel between Warrington and

Penketh Bar below Norton Marsh would be straightened, and where the present more expanded channel of the river was reached dredging and training of the low-water channel would commence and be continued to Runcorn. It was proposed that the navigation should, as a minimum, be 228 feet wide at the level of high water, and 80 feet at the bottom. An approximate estimate of the probable cost of this undertaking showed that it would cost 4,500,000 $\frac{1}{2}$ . This modification of the original estimate of 3,500,000 $\frac{1}{2}$  had arisen from the adoption of an enlarged area of basin at Manchester, and also an increase in the dimensions of the navigation from 12 feet at low water to 22 feet. With a view to create a discussion to elicit the opinion of those likely to be well acquainted with local requirements, and to secure the means necessary, it was proposed to make careful detailed surveys, and to explore the district by sinking shafts and making borings, in order to ascertain accurately the nature of the excavations. Owing to the large amount of unemployed capital, and to the serious dearth of employment existing throughout the country among the class of workmen usually employed on similar undertakings, the present period was considered opportune for carrying out an extensive engineering undertaking such as the one above referred to.

Mr. Hicks said the ship tonnage which entered and left Liverpool in 1881 amounted to 15,787,896, and the estimated amount of cargo was 145,000,000 tons, nearly 50 per cent. of which consisted of Manchester goods. The exports from Liverpool were 84,000,000 tons, of which 43,000,000 were Manchester goods. There were also several million tons of woollen goods coming from Yorkshire, and passing through Manchester, and also metals from Staffordshire. Very nearly four-fifths of the export trade of Liverpool came through Manchester at this moment. Then there were the imports, which amounted in value to 114,000,000 $\frac{1}{2}$ , the vast bulk of which must find their way within the triangle of which Manchester was the centre. Of the 14,000,000 tons of shipping leaving and entering Liverpool, at least 5,000,000 would use the proposed navigation, and goods would find their way to Manchester either directly in the ships or by means of local steamers. If a charge were made of 3s. per ton on that 5,000,000, they would get a revenue of 750,000 $\frac{1}{2}$  per annum; and, if a charge were also made for the vessels, they would get an additional revenue of 125,000 $\frac{1}{2}$ , which was much less than the charges made by the Mersey Docks Board. If they added to that the rents arising from the property gained in connection with the navigation that would be another 25,000 $\frac{1}{2}$ , making the gross revenue 900,000 $\frac{1}{2}$ . Allowing 15 per cent. for working expenses—which was a large estimate, the proportion in the case of the Suez Canal being only 6 per cent.—then there would be a net revenue of 765,000 $\frac{1}{2}$ . That sum would pay 10 per cent. if the undertaking cost 7,000,000 $\frac{1}{2}$ , and 5 per cent. if it cost 14,000,000 $\frac{1}{2}$ . In addition to that, it must not be forgotten that on this 5,000,000 tons there would be a saving of 4s. a ton in freight, which would amount to 1,000,000 $\frac{1}{2}$  per annum; and there would in addition be a saving of Liverpool dock dues of 214,000 $\frac{1}{2}$ , being a total saving on 5,000,000 tons of 1,250,000 $\frac{1}{2}$ .

A provisional committee was appointed to inquire into the best means of carrying out the project.

### STRAW BOARDS.

THE Legation Report on the manufactures of the United States includes the following account of the new straw lumber industry:—There can be no question that the straw lumber is admirably adapted to many kinds of finishing work, barrels, table and counter tops, fine doors, and ornamental work; and we are assured that it can be produced and sold in competition with the finer grades of pine, or in competition with wide walnut, at about one-half the price of the latter. The standard manufacture is in widths of 32 inches, a length of 12 feet, and a thickness corresponding to that of surfaced boards. These dimensions may be varied to suit such orders as may be given, and embrace any width, length, or thickness. Unlike lumber, however, narrower widths are the most costly. The straw lumber may be ripped with the hand-saw, or upon the buzz-saw; may be run through the sticker for the manufacture of mouldings, and takes a nail or screw about as well as oak. It may be finished with varnish or with paint, and is susceptible to a high polish. It is practically water and fire-proof, being manufactured under 500 degrees of heat, and we are assured has been boiled for some hours without any apparent change of structure. Its tensile strength is greater than that of walnut or oak, and its weight about one-fifth greater than the former when dry. It is made from any kind of straw, including hemp and flax fibre—in fact, from any material that will make pulp—and a ton of straw will produce 1,000 feet of boards. The pulp is rolled into thin sheets, a number of which, corresponding with the thickness of the lumber desired, are placed together with a peculiar cement, which is claimed to be waterproof, and are then rolled under a pressure sufficient to amalgamate them into a solid mass, which may be worked with a plane if desired.

When it is remembered that it takes 100 years to grow a tree to maturity, suiting it for commercial purposes, and a tree producing 32-inch lumber will require fully twice that time, while

20,000 feet per acre is a large yield under the most favourable circumstances, it will at once be realised that where 2,000 feet can be taken from an acre of ground for an indefinite number of years, the process which enables such a result to be accomplished, and which will yield a really valuable lumber, is one of vast importance. We look for valuable results in the future in the manufacture of lumber from what is practically a waste material, but which will be produced in endless quantities so long as the United States maintains its character as a grain-producing country. The factory at the time of its destruction by fire was turning out 20,000 feet per day, and had orders for 10,000,000 feet.

### SMOKE ABATEMENT EXHIBITION.

AT a meeting of the Smoke Abatement Committee, held at 44 Berners Street, Mr. Ernest Hart in the chair, jurors' reports were handed in from Colonel Festing, C.B., Professor Chandler Roberts, F.R.S., Mr. Atchison, Mr. D. Kinnear Clark, Mr. Harris, and others, on behalf of the various juries, discussing the results obtained and tabulating the figures shown by the various tests. The chairman said that the committee were greatly indebted to the eminent men who had given so much labour to this work, and who by their individual exertions and superintendence so largely added to the value of the jury reports. Great satisfaction was expressed at the excellent results which these reports show to have been achieved by some of the leading exhibits in the economy of fuel and abatement of smoke in open grates, as well as the satisfactory action of open grates and kitcheners intended for burning anthracite or smokeless coal. Great success was said to have been attained by various exhibits in showing how ordinary Newcastle coal can be burnt in open grates and ordinary kitcheners without any sensible production of smoke. The hon. secretary (Mr. W. R. E. Coles) announced that the Manchester Exhibition of Smoke-abating Apparatus, carried out partly under the auspices of this Society, had proved highly successful, and had attracted great interest among the practical men in the Lancashire district, and would, it was believed, be fruitful in good results. The arrangements were discussed for converting this committee into a permanent institution for smoke abatement, under the provisions of the law. It was announced that the Duke of Westminster would preside at a meeting to be held at Grosvenor House on Friday, July 14, for the purpose of distributing the awards, when it was expected that all the reports and tabulations would be ready in the form of a volume for public information.

### The Competition Question.

SIR,—Your leader of Saturday last constrains me, however reluctantly, to again protest against the pessimist ideas you have ventilated on this question.

To repeat the argument I formerly took would indeed be superfluous. The main point (to refresh your readers' memories) was, "names v. men"; or to give it in an ironical style, taking the Glasgow competition as a text: Why not, as you say (though even this is precluded by the "instruction"), open the envelopes, put the "big gun" in front, should he be amongst the ten, or, if not, refer back to the 115 rejected ones, hunt him out, and let him perpetuate his name to the glory of British architecture of the nineteenth century? But one may whisper, What about the author of the best design, if such an one is young and comparatively unknown? "Oh, give him his cheque for 150 $\frac{1}{2}$ , even if only about half his due as an architectural draughtsman, brains being nothing; tell him youth is a crime in architecture; that the royal road is round the corner; and in future to be careful not to try to step in front of his elder brother."

Seriously, to return to your article: the answer to all your arguments, in my opinion, is a short and conclusive one. If the selected author should, in the wisdom of the "Town Council," fall short of the necessary qualification (whatever that may mean), why not let him be employed with an architect of eminence as consultant?

Mr. Barry—the saviour of the hope of British architecture, and I use the term in all seriousness—deserves the approbation of the profession in so manfully combating the reservation clause. He knows, and his robustness is born of the fact, that it will be impossible for the merely "pretty draughtsman," "the architect to the trade," or even the "academical youngster," to stand at the head of a competition conducted by a thoroughly competent assessor. The trial is too severe for such as I have named, demanding as it does a grasp not only of architecture as a fine art, but a thorough knowledge of construction, good planning, and the other handmaids-in-waiting. In this knowledge, properly applied, an efficient architect assessor may stand invulnerable; and I take it Mr. Barry's answer implies what I have attempted to show.

Overwhelming evidence can be adduced in support of the fact that architects of eminence have, in almost all instances, crept upwards by the ladder of competition—in fact, take away competition, and where is the hope of architecture as applied to the comparatively unknown?

Who can estimate the value of competition when viewed in the light of an educating influence? What number of architects would care to carefully look into the planning of special buildings and endeavour to excel in such if no object was in view? I hold, sir, that in place of the present hopefulness of British architecture, we should gradually sink lower and lower in the art if this means of education was sapped. Your desire to ventilate this subject thoroughly is a cause for congratulation and of apology from me in further troubling you on the subject. I am, sir, J. L.

#### The Cyrene "Apollo."

SIR,—The marble head from Cyrene which Mr. Watkiss Lloyd refers to in the last number of *The Architect* was not, as he implies, placed for the first time beside the Choiseul-Gouffier *Apollo* during the recent rearrangement of some of the sculptures in the British Museum. It had, in fact, for a number of years previously stood close beside that statue in the Phigaleian Room, where it had been so placed for the purpose of comparison, and, so far as I was concerned at the time, to serve as an argument against Professor Boetticher of Berlin, who maintained, as Dr. Waldstein now maintains, that the statue represents an athlete. But the mere fact of the head having been placed so long beside the statue ought, one would think, to have led Mr. Lloyd to spare the remark that it "is rightly, if without any recognition of its real importance, inscribed *A Head of Apollo*."

I do not complain of his ignoring altogether the circumstance that this Cyrene head is engraved, and what he calls its "real importance" pointed out, in my "History of Greek Sculpture before Phœidias," p. 190, with a note on the preceding page which may interest him. Yet it is curious that Dr. Waldstein should be so severely handled for a similar omission towards Mr. Lloyd!

Yours obediently,

British Museum.

A. S. MURRAY.

#### LEGAL.

High Court of Justice.—Queen's Bench Division, Guildhall.  
June 26.

(Before Mr. Justice MANISTY.)

PARR & STRONG v. SMITH.—ARCHITECTS' FEES.

This was an action brought to recover a sum of 141*l.* for work done and services rendered by the plaintiffs to the defendant in May 1881, in preparing plans for two houses which the defendant intended to build at Gravesend. It was the second hearing of the case, the first trial, which had resulted in a verdict for the plaintiffs for the full amount, having taken place before Lord Justice Cotton and a special jury at Maidstone. (See *Architect*, February 4, 1882.) Subsequently a new trial had been ordered, on the ground that this verdict was against the weight of evidence, and also on the ground of misdirection. The defendant did not deny that he had employed the plaintiffs to prepare sketches for two houses, with stable and coach-house, similar to the house of Mr. Walker, at Gravesend; but his case was that they had agreed that the cost of the whole of the buildings should not exceed the limit of 1,200*l.* or thereabouts. The defendant's case was that the plans prepared by the plaintiffs had been useless to him, the lowest tender obtained, when they had been submitted to public tender, having amounted to as much as 2,638*l.* He paid 10*l.* 10*s.* into court in respect of their cause of action, so far as he admitted the same in his statement of defence.

At the conclusion of the case, his Lordship summed up, pointing out the greater probability of the defendant's case as to his having given the limit; and the jury, without leaving the box, returned a verdict for the defence. His Lordship thereupon gave judgment accordingly.

Supreme Court of Judicature.—Court of Appeal.—June 26.

(Sittings at Lincoln's Inn, before the LORD CHIEF JUSTICE and Lords Justices LINDLEY and BOWEN.)

STENT v. HARRISON.

This was an appeal by the defendant from the judgment of Mr. Justice Manisty in favour of the plaintiff at a trial which took place before his Lordship without a jury. The plaintiff, who is an architect at Warminster, sued for commission upon the sale of Stainsbridge House, near Malmesbury. He alleged that he had brought the property to the notice of Mr. Edward Miles, who in consequence became the purchaser at the price of 6,500*l.* The claim was for a commission at the rate of 2½ per cent. on the first 5,000*l.* and 1½ per cent. on the remaining 1,500*l.* The defendant, who is a member of the firm of Harrison, Beale & Harrison, solicitors, was sole executor of the will of Mr. George Coote, the owner. Messrs. Harrison & Co. were instructed to sell the

house. The plaintiff, in August 1875, received instructions from them to find a purchaser, Mr. Chubb, a solicitor at Malmesbury, having already received similar instructions. The house was advertised in *The Times* and other London papers, and the names of Messrs. Harrison & Co. alone appeared at the foot. Advertisements were also inserted in local papers, with the plaintiff's name subscribed. On December 17, 1875, Colonel Miles went to Chubb's office and made an application on behalf of his brother, Mr. Edward Miles, with reference to a letting of Stainsbridge House. Mr. Chubb was away from his office, and the clerk, not knowing that the particulars with regard to the house were in Mr. Chubb's possession, wrote to tell Mr. Stent that Colonel Miles had called to ask about the house. On December 18, before Stent had received Chubb's letter, Mr. Edward Miles went and looked at the house, and two days afterwards wrote to Stent that, seeing the house still advertised in the local papers, he had gone over it and wished to have particulars. Stent then wrote to Messrs. Harrison asking them to consider about letting the house. Ultimately the house was purchased in 1876. Stent had been paid for the advertisements which he had inserted, and it was contended on behalf of the appellant that no authority was given to Stent to subscribe his name to the advertisements. It was said to be the ordinary practice of house agents to advertise at their own expense, recouping themselves out of their commission.

The Lord Chief Justice said that actions like this must be very carefully watched. No doubt the work done by an agent entitling him to commission was often very slight, but if what he did was the determining point from which the purchase came to be made that was enough. It might be no more than a wave of the hand effecting an introduction, but if that brought about the purchase the agent's commission was payable. In the present case certainly very little had been done by the plaintiff. For himself, his Lordship thought he would not have come to the conclusion at which Mr. Justice Manisty had arrived, but there was one very material incident which made him think it would be wrong to reverse the judgment. It could not be denied that Mr. Miles was a witness who would naturally have no leaning in favour of either side, and, on the whole, his evidence, though it was not very satisfactory, was distinctly to the effect that Stent had brought about the purchase. If the matter had rested on the advertisements only, his Lordship would have said the defendant was entitled to succeed. Either Stent had no authority to put his name to the advertisements in the local papers, or, if he had, it was not through them that the purchase was brought about. It seemed that the application made to Chubb had wrongly been communicated to Stent by Chubb's clerk, but that was not material. If Stent did the determining act which led to the purchase, his commission was payable. His Lordship could not say that Mr. Justice Manisty was not justified in coming to the conclusion that something had passed between the plaintiff and Mr. Miles which had had the effect of bringing about the relation between Mr. Harrison and Mr. Miles which ultimately led to the purchase. He gave this judgment with reluctance, as he had personally a strong prejudice against these claims—a prejudice which he hoped was not unfounded. He must reluctantly affirm the judgment appealed against.

Lords Justices Lindley and Bowen concurred.

#### CHURCH BUILDINGS AND RESTORATION.

**Easton.**—It is proposed to complete the restoration of Little Easton Church, which has been going on for some time, by the addition of an oak screen dividing the chancel from the Maynard chapel, and fitting up the chancel with oak stalls. The restoration commenced three years ago, and additional accommodation was obtained by taking down the old vestry on the north side and building a north aisle. The nave roof was renewed in oak, similar in character to the chancel roof. The western gallery over the porch was removed, and the fine Norman arch opened to view. The Maynard chapel has been restored, and a new oak roof put in. The exterior walls are faced with flint rubble, and the windows at the east and west ends are restored and filled in with glazing. The work has been carried out under the direction of Mr. J. Clarke, of Stratford Place, diocesan architect, and the builders were Messrs. W. Bell & Sons, of Saffron Walden.

**Sal.**—The foundation-stone of the new church of St. Paul's, Sale, Cheshire, is to be laid to-day (Saturday) by Mr. W. Cunliffe Brooks, M.P. The structure is Early English in style, designed by Mr. Henry R. Price, architect, of Manchester, and will consist of nave, side aisles, and chancel, with tower and spire, and will contain 750 sittings. The cost of the building, exclusive of tower and spire, will be 4,500*l.*

**Devon.**—The new church of St. John, Ivybridge, has been opened. The building consists of nave, north and south aisles, chancel, organ chamber, south porch, and tower at the west end of the north aisle. The tower and north aisle, however, have yet to be built, and the arcade on the north side is temporarily built up. The building is in the Early Pointed style, carried out in local red dunstone and granite, and Bath and Portland stone dressings. Messrs. Finch & Son, Plymouth, are the builders, and Messrs. Hine & Odgers the architects.

**Chester.**—The Welsh church at Chester has been reopened after works of restoration carried out by Mr. Thomas Brown, builder, of Chester, from the designs of Mr. John Douglas, architect. The church, as reconstructed in 1721, was in the Queen Anne style as to its exterior. The work of restoration has included the taking down of the old north wall and extending the church by a new aisle, an arcade of timber dividing it from the nave.

**Bridgwater.**—St. Joseph's new Catholic church in Binford Place, Bridgwater, was opened on Thursday. The church consists of a sanctuary or chancel, nave, aisle, side chapel, porch, organ-gallery, and sacristy. It is built of brick, with Bath stone dressings, and covered with Bridgwater tiles, from the designs and under the superintendence of the Rev. A. J. C. Scoles, the priest at present in Bridgwater. Early Decorated was the style chosen, which necessitated a simple form of construction, the beauty of which consists in its proportion and general outline. The nave has three double lancet windows, the chancel having a clerestory. The façade to the river is imposing, with its three well-proportioned windows, relieved by columns and moulded arches. The wall between the chancel and nave is surmounted by a turret, containing the "Sanctus" bell. The chancel is divided into two bays, and lighted by four clerestory windows, whilst the east end has three windows filled with stained glass to the memory of one of the sons of Mr. York, its donor. In the north aisle a stained-glass window, representing the death of St. Joseph, has been erected by the Rev. A. J. C. Scoles in memory of his late father, the windows being the workmanship of Messrs. Lavers, Westlake & Burraud, of London. Mr. J. Kitch, of Bridgwater, is the builder; Messrs. Bradfield & Sons, of Bridgwater, the masons; and Mr. A. B. Wall, of Cheltenham, has executed the carving and canopies.

### SCHOOL BUILDINGS.

**Newcastle.**—Part of the establishment known as the Tyne Brewery, in Bath Lane, is being adapted for the purpose of a Catholic Grammar School. The brewery, with its offices, out-buildings, and yard occupied about an acre and a half of ground, and about one-third of it has been bought. The offices of the brewery will be used as the school itself, and are being converted into classrooms and schoolrooms. A second storey will be added for dormitories. The principal schoolroom will be 53 feet in length by 30 feet in breadth. The alterations to the buildings are being made from designs by Messrs. Dunn & Hansom, architects, Eldon Square, and the work is being done by Mr. Wm. Fogg, contractor, Villa Place.

### NEW BUILDINGS.

**Richmond, Yorkshire.**—Lady Zetland a few years ago opened an experimental coffee tavern in the ancient town of Richmond, which proved so successful that the Earl of Zetland determined to erect a new and enlarged building on an excellent site near the market-place. This has now been completed, and it was opened to the public a short time ago. Messrs. Oliver & Leeson, Newcastle-on-Tyne, were the architects.

### ART WORKMANSHIP.

**Sculpture.**—A new reredos has recently been put up in Great Bealings Church, Suffolk, as a memorial to the late Lord Hatherley. It is of Bath stone divided into three compartments, with alabaster shafts and richly-carved canopies, from designs prepared by Mr. Wm. Basset Smith, of 10 John Street, Adelphi, London, and executed by Messrs. Cornish & Gaymer, of North Walsham, Norfolk.

**Reredos.**—The chancel of the new church of St. Mary, Windermere, is about to be enriched by the addition of a reredos. The design is Early English in style, and the body of the work will be wrought in polished alabaster. The central portion is divided into five panels, with moulded and carved canopies, supported on green marble pillars. Four of the panels will be filled with representations of the Evangelists, in pure white alabaster; and in the central panel a carved cross of the same material will be placed upon a diaper background, relieved with a slight charging of pale gold. The work has been entrusted to Mr. Roddis.

**Jubilee Window.**—The University of Durham has this week celebrated its Jubilee, and in connection with the celebration a stained-glass window has been placed in the Great Hall. The window has been designed by Mr. C. Hodgson Fowler, of Durham, and executed by Mr. C. E. Kempe. It consists of four lights, with three principal tracery compartments. The greater part of the window is occupied by shields bearing the arms of bishops and others associated with the Castle and University, with a background of thickly-matted foliage in grey and pale green glass. Intertwined among the foliage, and between the shields, &c., are many scrolls, bearing the University motto, "Fundamenta eius super montibus sanctis." The lowest portions of the four lights are occupied by figures bearing large square fringed banners, and standing on flowery turf. Along a band at the bottom of all runs the inscription, "Universitatis hujusce jam L annos fundatæ memorem hanc fenestram alumnis posuervit MDccclxxii." The figures represent the prominent historical and ecclesiastical personages connected with the ancient City of Durham.

### GENERAL.

**Mr. T. G. Jackson, M.A.**, architect of the New Schools, Oxford, has been elected an Honorary Fellow of Wadham College.

**Mr. J. B. McCallum**, Borough Surveyor of Stafford, has been appointed Borough Surveyor of Blackburn, at a salary of 500*l.* per annum. There were seventy-three applicants for the appointment.

**Mr. Harris**, ex-Bailie of Dundee, has handed over to the town of Dundee the 30,000*l.* he promised to give for the benefit of higher education. This sum is divided into two portions, and 10,000*l.* is to be applied to the erection of a school, which it has been resolved by the School Board to name the Harris Institute, for the higher education of children connected with the public schools.

**Mr. J. H. E. Partington** has been commissioned by the Professors of Owens College to paint a presentation portrait of Dr. J. G. Greenwood, Vice-Chancellor of the Victoria University.

**Mr. W. Glover**, of Newcastle-on-Tyne, has been commissioned to prepare plans and obtain tenders for the erection of the buildings required for the Marine Exhibition at Tynemouth.

**Mr. J. Piers St. Aubyn** has prepared plans for repairs and restoration of St. Michael's Church, Helston.

**M. Gustave Doré** has purchased a building site at the corner of Parc Monceau, Paris, for 584,625 fr.

**The Paris Salon**, which closed last week, has had since May 269,933 paying and 295,000 free admissions. The aggregate receipts are 386,000 fr., and a surplus of 200,000 fr. is expected.

**The Bristol and Gloucestershire Archaeological Society** will hold its meeting this year at Stow-on-the-Wold on July 25, 26, and 27.

**The Sales** of pictures at the Cambrian Academy of Art Exhibition, Llandudno, have realised 500*l.* during the first week.

**The Kirkcaldy Fine Art Association** held its annual meeting last week under the presidency of Mr. John Sang, C.E. Office-bearers and committee were appointed for the year, the Earl of Elgin being elected President. The exhibition will be opened on September 4. The sales of works disposed of since the formation of the Association amount to nearly 10,000*l.*

**A Monument**, designed by the late Mr. G. E. Street, R.A., has been placed in the east aisle of the south transept of York Minster as a memorial of the late Dean of York, Dr. Duncombe.

**M. Jadin**, who has been called the French Landseer, has just died at the age of 77. The death of the French painter, Biard, in his eighty-fourth year, is also announced.

**The Lerwick Harbour Trustees** have negotiated a loan of 15,000*l.*, and are now about to proceed with the construction of a pier and other improvements at the harbour.

**Designs** for a new town hall at Pathhead have been submitted in competition by Mr. Raeburn, Edinburgh; Messrs. Anderson & Browne, Edinburgh; and Messrs. Campbell Douglas & Sellars, Glasgow.

**The Crystal Palace Authorities** have decided to continue the lighting of the terrace throughout the coming summer months by the André system of electric lighting, and have sanctioned the extension of this system over the track of the electric railway which is about to be opened in the grounds.

**The Indian Government** intend to proceed with the project for building a large central station in Calcutta for the use of all the railways converging there.

**The Dover Town Council** have given their support in favour of an application to be made by the Dover Harbour Board and the railway companies for leave to apply during the present Session of Parliament for a private bill to construct a deep-sea harbour.

**The Bishop of Exeter**, at the luncheon at Ivybridge on occasion of the opening of the new church of St. John, on Tuesday, said, that amongst all the things one could do it was difficult to find any more truly useful than a beautiful church, and that when people wanted to cut everything down to the standard of mere utility he would venture to say that, measured even by that standard—if only we would understand by utility that which cultivated the highest and best faculties—there was hardly anything that was more really useful in the highest sense than bestowing upon them a beautiful building in which they could take pride and pleasure, and which they could associate with their religious feelings.

**A Stained-glass Window** has been placed in Ledbury Church, as a memorial of the late Mr. Thomas Webb, banker. It was designed by Mr. W. H. J. Westlake, F.S.A.

**University College, London.**—The prizes obtained in the classes were presented on Wednesday. Among others were the following:—Slade Fine Arts Scholarships (50*l.* per annum for three years); Sarah C. Harrison, of London; Harrington Man, of London. Architecture (construction), Donaldson Silver Medal, C. M. Shiner, of London. Fine Art, painting from life (prize of 10*l.* and silver medal), C. Holroyd, of Leeds. Fine Art Anatomy, F. W. Bourdillon, of Tunbridge Wells.

# The Architect.

## THE PROPOSED NEW GOVERNMENT OFFICES.

OW long it is to be ere nations learn the art of war no more, is a question which seems to be as far as ever from a solution ; but at any rate there is no doubt that the pressure of military and naval affairs in these days of ours increases rather than diminishes in Pall Mall and Whitehall, and the Government is therefore under the necessity of building in some convenient spot new offices on an enlarged scale for the accommodation of the business of the War Department and the Admiralty. The project is at present in the preliminary stage of parliamentary enquiry, and with reference as yet only to the acquisition of a site ; but two incidents have occurred which will be of interest to our readers, namely, first, that the authorities of the Office of Public Works have made public a map showing the proposed position, extent, and block plan of the buildings ; and secondly, that the Council of the Institute of Architects has seen fit to deliver a protest or condemnatory manifesto thereon. We ought perhaps to add that, thirdly, this proceeding has not been very respectfully received.

The block plan is a very simple one. The area which extends in frontage from the Horse Guards in Whitehall to Messrs. COX & BIDDULPH'S Bank in Charing Cross, and in depth from the street line to the ground occupied by St. James's Park, together with the supplementary portions lying between Spring Gardens and the Park, in all about four acres of land, is made to accommodate almost exclusively one great group of building, with a façade about 440 feet in length along the street, and a general depth of about 420 feet between the street and the park.\* This edifice is divided arbitrarily, without interfering with its symmetries, into two unequal parts : the War Office taking the southward division next the Horse Guards, and the Admiralty taking the northward division. Five interior quadrangles are suggested for light, and the result externally is a plan, somewhat irregularly disposed to suit the shape of the site, but still quite symmetrical ; the Horse Guards parade, that is to say, is preserved intact in the rear of the reduced depth of the extreme south wing, whilst at the north the mass facing the Park runs behind the house of Messrs. COX & BIDDULPH, and yet the disposition of the several façades is classically systematic. Lastly, as regards the ground behind Spring Gardens, the westward portion of it is appropriated to an official residence, with a piece of garden attached facing westwards on the offices of the Metropolitan Board of Works, and the eastward portion is chiefly devoted to the formation of a new roadway, nearly 60 feet in average width, leading from King CHARLES'S statue to the Mall in the Park ; another piece of garden being left to face that of the official residence on the other side of this road. Incidentally, the well-known narrow footway which passes into the Park by the Metropolitan Board Office is enlarged into a second public entrance, 40 feet wide, and the width of the old street called Spring Gardens is increased to about 60 feet. It will be at once seen that liberal dimensions pervade the scheme throughout, and the eye of an architect will be able to discern also a great deal of unaffected ingenuity and good sense in every part of it. Looking at the plan, therefore, dispassionately (and why should any one do otherwise ?) it has all the appearance architecturally of being a good and grand one ; and we may venture to say there is no sign of its having been as yet carried any further into development than it professes to go ; the design of the building, in other words, has yet to be made, and there is evidently plenty of scope for the skill of an experienced artist, or, it may be, for that of a hundred ambitious competitors. Indeed, we note the announcement in the newspapers that public competition is to be resorted to.

It is not the custom in this country for the Government to take steps in a preparatory way for sounding the professional architectural world upon a great public undertaking of any

kind. We think this is to be regretted ; because, after all, although Parliament is no doubt the only legitimate exponent of the most experienced public opinion in all that concerns business and common sense, yet the "Royal Institute of British Architects," if at all worthy of the name, ought to be regarded as the equally legitimate exponent of the most experienced public opinion upon all questions of architectural skill. The value of what is called an "officious" or unrecognised semi-official opinion upon any very important project, obtained privately from a body of experts in the particular profession interested, and arrived at carefully in the interest of the cause, cannot well be overrated. We admit that it is essential in such a case that the profession in question should be so represented personally as to command the confidence of the Government ; but we have no reason to suppose that the Institute of Architects, as at present developed, would not in some form or other, if properly called upon, answer to this condition to the full.

Whether the Council of the Institute (whose composition and policy just now must no doubt be acknowledged to be the subject of a little dissatisfaction) has gone to work in the case before us in precisely the best way, we must leave our readers to judge ; but what has been done may be described in very few words. We have said that the Government plan proposes to form a good new roadway, or rather two, from Charing Cross into the Park. Neither of these lines of thoroughfare can be said to lie exactly on any existing axis ; but, accepting the general style of London thoroughfares, which seem to have a chronic objection to perfectly direct lines, these new thoroughfares are not by any means wanting in good points. However, what the Institute Council has done is simply to demand, reason or none, a continuation of the Mall into Charing Cross, at a width of over 100 feet. The axis would still not be that of the Mall, or even that of the Strand ; but it curves from the one to the other, and takes the statue of the stubborn king centrally ; and so far so well. It has to be remembered, however, that there are two opinions about the propriety of the long-discussed idea of "opening the Mall into Charing Cross," and that many good authorities, indeed, object to it *in limine*. What they contend for is—conceding the point as to the thoroughfare being desirable in some form—that it ought to be, not a flaring avenue proceeding out of the Park into the town at a rush, but a more private and in a manner almost secluded "Gate" leading from the town quietly into the Park ; and that this is simply the view which the advisers of the Government have now adopted is all that need be said—except that it is not at all unlikely the public at large may be found to prefer it.

We do not presume to dictate to the Council of the Institute, and we prefer to suppose that the Council scarcely wishes to dictate thoughtlessly to the Government, or to Parliament, or to the public ; but if we were to invite the profession unreservedly to support the line of criticism which is adopted in the "letter ordered to be addressed to the First Commissioner of H.M. Works and Public Buildings" by the Institute Secretaries, this would be more than we can conscientiously do. If it were a fair question, we should like to ask who composed the document ; but at any rate it runs thus : "Without more particular information" the Secretaries are instructed to do themselves the honour of informing Mr. SHAW-LEFEVRE that "it is impossible to assert that the proposed site is not sufficient" for the mere accommodation required ; but the block plan and the "inadequate and cramped quadrangles" nevertheless "convey the impression" that it is "inadequate for the purpose." Secondly, it is magnificently declared that the "opening up" of the Mall in the grand style—or pseudo-grand—"ought to be an indispensable feature of the scheme," and not a syllable of argument or of explanation is wasted upon this point. Thirdly, the whole of the remaining buildings between the proposed site and Trafalgar Square, including COX & BIDDULPH'S Bank, DRUMMOND'S Bank, the Sun Fire Office, and the Union Bank, besides many private houses, ought peremptorily and at all hazards to be simply swept away. Why ? "By avoiding such properties," says the letter sarcastically, "the scheme may commend itself on the score of economy ; but to locate important public offices in the background is a scheme which from all other points of view would appear to court condemnation." The language is almost less felicitous than the logic, but the idea would seem to be that, if the Government would carry on the frontage of the new buildings round the corner, and all the

\* May we without offence suggest that a plan issued by the Institute to its members ought to have a scale attached ?

way to DENT the watchmaker's, it would be a great deal longer, which is no doubt perfectly true. As for the new buildings as now proposed being "in the background" and "shut in by property of an inferior character," we can only say that it is not easy to identify the description through phrases so obscure. The protest from beginning to end is querulous, unconsidered, and, we very much fear, will be called foolish.

The Secretaries are "further instructed to add" that the President of the Institute (possibly wearing his chain of office) would be happy to attend the Parliamentary Committee and give such further explanations as may be desired. It is scarcely necessary to remark that the Committee did *not* ask Mr. HORACE JONES to attend them. The impression left upon the minds of a select group of the gentlemen of the House of Commons by a letter of this character would probably not be such as to induce them to ask for more; and Messrs. MACVICAR ANDERSON & WHITE have "had the honour to be the obedient servants" of Mr. SHAW LEFEVRE for nothing, as Professor DONALDSON, for instance, or any one else who has been accustomed to deal with public men in similar cases, might have told them beforehand.

How would it answer if the Institute were to appoint what is called a "Parliamentary Committee," formed of men carefully chosen for the task of transacting public business on behalf of the profession? The fiasco now before us is surely enough to teach the Council a lesson. Nothing short of the best judgment expressed in the most cogent language is worthy of the high ground on which such business must be transacted if it is to be done at all. That the Institute had an opportunity here of making a hit must be plain to any one; that the mark has been missed is plainer still. The designers of the block plan are to be congratulated upon the form in which they have submitted to Parliament and the public a very stately project; and we will only add the hope that the advisers of the Government in respect of the proposed competition of architects which is to follow may be able to devise such conditions—and they will bear a great deal of devising—as shall spare the nation, for once at least, from a repetition of the blundering which for the last fifty years has made almost every attempt to obtain a fit design for a great public building in England more unsuccessful in one way or another than all that have gone before.

### THE STORY OF MYRRHA: GIORGIONE OR TITIAN?

**A**MONG the pictures happily secured for the nation from the Duke of HAMILTON'S sale is one in most perfect preservation, and of such admirable beauty that the price paid for it of 1,700*l.* is relatively to be esteemed most moderate. This is not half the price paid for the vast Botticelli—national money, again, not ill laid out—but it has brought the nation double the money's worth in the best qualities of fine art as distinct from archæology. The picture is that of which the subject is given as *The Story of Myrrha*. This title seems at first enigmatical, but is justified on closer attention to details. The ascription to GIORGIONE seems somewhat more difficult of acceptance. Have we among the few absolutely authenticated works of this master any examples which justify us in confidently recognising in this beautiful picture a clear identity of style and execution? If this cannot be very positively affirmed, one is disposed to claim the picture for TITIAN, always supposing, again, that it is possible for his execution of so admirable and important a picture to have escaped record as coming from his hand. The transparent glow of the flesh tints is suggestive of his marvellously significant picture, for those who have the key to the enigma, of *Sacred and Profane Love*, in the Borghese palace at Rome; and the foliage of the trees in the centre seems in harmony with that of the lost *Peter Martyr*. Some details in the background—a significant pair of rabbits, and the management of smaller groups of figures—agree in intention or treatment with the Borghese picture. The questionable drawing of a leg does not impugn the inference; there seems something wrong in the setting on of the leg of the nude figure in the Borghese, and it can be paralleled among the troop of followers in the *Bacchus and Ariadne* of the National Gallery; and the somewhat sturdy proportions of the chief female figure reproduce the type of the nymph with the cymbals, and even of ARIADNE herself. The landscape background, especially in the remote distance, recalls back-

grounds of TITIAN. In any case, the picture is a triumph of Venetian colour. Those who can be content to appreciate a picture on its merits and love it for its own sake, may be glad to remit the discussion as to authorship to the cognoscenti, who, in their controversies on this point, are usually only interested in such merits in quite a secondary degree. It is in the background of the picture that the unpleasant story of MYRRHA is told in a series of detached incidents, mercifully reduced by distance. The main group embodies the sequel of a story which had to be indicated, but which all are glad should be rendered not more distinctly than as a vague reminiscence. The painter seems to have sought for no other authority beyond OVID in the tenth book of the "Metamorphoses," unless perhaps he also took one secondary hint from OVID'S summarist LACTANTIUS. This writer supplies what OVID seems to have casually omitted in its natural place—the suggestion of offended pride which provoked VENUS to inspire MYRRHA with a passion for her father CINYRAS. In the picture we see the goddess aloft in the sky, apparently occupied in giving the commission to her son CUPID. Below, we can discern in the distance MYRRHA flying from her father, who pursues her, indignant at the deception which she had practised upon him ("Met." x. 476); then we see her on her knees, in the act of supplicating the gods for some punishment that may remove her equally from the living and the dead (v. 486). Her prayer was granted by her transformation into the myrrh-tree, which bore her name; at the extreme right of the picture we see her in remote distance still, with arms upraised and branching forth with leaves, her body, as a tree-trunk, rooting below (v. 490). From the rent trunk a group of nymphs, the Naidæ, receive the strangely-born infant.

This infant grew, so the tale ran on in the Latin form of a Hellenised Oriental mythus, to be the beautiful ADONIS, for whom VENUS, wounded casually by her son's arrow as she embraced him, conceived so infatuated a passion as in some degree to avenge his mother MYRRHA (v. 524). Such is the only notice OVID gives of an act of malice on the part of the goddess originally that called for such revenge. Quite unsuspecting of the effect upon her of the scratch by her son's arrow, she prefers ADONIS to the skies, and is for ever in company with him. In the succinct costume of DIANA, uncovered to the knee, she delights herself with him in the shade, or takes part in the chase of least formidable game. She dissuades him from exposing himself to dangerous encounters with boars or lions, and woos him to take rest in the poplar shade. In the poem, thus, as in the picture, there is no hint of the customary recusant coyness of ADONIS. The painter has placed not far off the same amatory symbol that is introduced in the Borghese picture—a pair of white rabbits. The conclusion of the story of ADONIS—who hunted once too often a creature too ferocious and died by the boar's tusk—seems to be indicated in the background at the left of the picture. A female figure in distress beside an outstretched corpse; by another more remote there is an obscure suggestion of a boar. Another female figure is introduced, separately occupied with an object which is not easily identified or explained. It looks like an escutcheon. Was it that of the patron?

In harmony of colouring, in glow of flesh tints, in transparency of shadow, and beauty of landscape and ultimate general unity of effect, this painting is worthy of a central place among the very best for which subjects have been furnished by Ovidian mythology.

When, therefore, we look into the unquestionable subject of the picture we have, to accept the pair of lovers—the really central and predominant group—as VENUS and ADONIS. Who would have been so bold as to claim these titles for them independently? Some boldness is required in any case; Dr. WAAGEN indeed flinched, and claimed the lovers as HIPPOmenes and ATALANTA, whose story OVID links on very inartificially to that of MYRRHA and ADONIS; he wanted it told, and employs VENUS to relate in detail how they were transformed into lions, to introduce a warning to her lover not to provoke wild beasts. There is indeed as little of the goddess about the VENUS as there is of the huntsman about ADONIS. It would seem as if the painter was minded to express the sentiment that the very nature of the Queen of Love and Beauty, the malicious inspirer of deceptive allurements and enticing affectations, was transformed into something of confiding simplicity when she herself was the victim of a delusion to which she made it her ordinary business to subject so many an innocent. She exhibits here as little of the tantalising coquettishness of

the Medicæan VENUS as of the self-confidence in the beauty which is one of the main forces of nature at large, that gives dignity to her of Melos. So let it most welcomingly be; and we may congratulate the painter and ourselves if he was moved to treat a subject that could scarcely be of his own choosing for its own sake, in such a manner that we are at liberty, if we wisely are so pleased, to look upon his work as representing a mere romantic love-encounter well within the limits poetically allowable for the old Saturnian times. Even so it is carried into a region somewhat remote from closer sympathies; of heart and soul in any elevated and elevating human sense the picture has none whatever. We gaze upon it with ever-increasing delight; it detains and interests the eye the more the longer we stand before it; but therein lies the charm exclusively—that new harmonies of tone and tint rise up spontaneously to surprise us as the regard travels by “many a winding bout” from one detail of the scene to another; we find ourselves for the time, and willingly, under the conduct of a magician who holds the keys of some of Nature’s secrets most potent to give pleasure, and of which he exults to exhibit his absolute command.

Certainly we may ask ourselves, in the absence of worthy interest in the subject, what does all this come to? Is not the enjoyment somewhat too Venetian? Is it not rather of the quality of the gloriousness of the Doge’s palace, the full enjoyment of which is dependent on forgetting that the festivity is divided only by a party wall or a vaulted floor from the cramped cells in the basement or the half width of the Bridge of Sighs filled not more surely with criminals than with the victims of the criminal tyranny that is flaunting in gorgeous robes among the masterpieces of TITIAN, GIORGIONE, and TINTORETTO? It is apt indeed and consistent that the glory of Venetian art should be concentrated in colour, to the distinct subordination, if not the suppression, of the more definite exposition of sentiment—tender or profound. Venice in her glory, in the prosperity which had such marvellous duration, was made up of a combination of political vigour in the administrators and political abasement in the governed; of gaiety and splendour ministered to by all the arts and a seething mass of indescribable social corruption below. As BROWNING says:—

What! they lived then thus at Venice?  
Some with lives that came to nothing, some with deeds as well  
Undone,  
Death came tacitly and took them where they never see the sun.

As for Venice and its people, merely born to bloom and drop,  
Here on earth they bore their fruitage, mirth and folly were the crop.

What of soul was left, I wonder, when the kissing had to stop?  
Dust and ashes.

Nay! something more. Among the dust and ashes at the bottom of the crucible in which revolutionary Time has calcined so much that was justly perishable, there are beads of precious metal, and these are saved for the world in the memorials of Venetian art—not least in the triumphs of Venetian colour. Colour simply, independently of subject and special characteristics, is on a par with instrumental music, and who shall disparage the moral value of the greatest musical creations. And if, as in the picture which is our theme, colour achieves one of its grandest triumphs in association with an unworthy collateral subject, it is much the same whether that subject be chosen by an Italian cardinal of the sixteenth century from a classical repertory, or a burgomaster is content if TENIERS presents him with the group of a drivelling old boor venturing to get a kiss from a frow in a washhouse. The boor and his servant in one instance and VENUS and ADONIS in the other are indifferent accidents. Nature’s truth and Nature’s dignity are asserted with her beauty independently in demonstrations of the exquisite and elevated delight derivable from the tones and tints in which the world is arrayed. The last harmony and the best is wanting of course when elements of repulsiveness are unhappily presented in combination with beautiful effects that in themselves are faultless; but the combination is not inextricable. Memory happily has a selective power of which the purely beautiful has full benefit, and imagination, exalted by contemplation of what is of unrivalled beauty in a GIORGIONE or a TENIERS, is even thereby enabled and incited to soar to elevations at which all that is repulsive in mythology as all that is mean in commonplace existence are equally and happily lost to sight.

## MENZEL’S ILLUSTRATIONS TO THE WORKS OF FREDERICK THE GREAT.\*

THE reputé gained by Herr ADOLF MENZEL as the greatest illustrator of the day is not likely to be otherwise than heightened by the volumes the French edition of which lies before us. The scheme of the work generally was planned by King FREDERICK WILLIAM IV. as a homage to the memory of his illustrious ancestor. Professor PREUSS, Royal Historiographer of Brandenburg, was entrusted with the collection of the literary remains of the great FREDERICK—his poems, letters, essays, orders, &c.—and MENZEL was commissioned to furnish 200 pertinent illustrations on wood. The book was printed by Court-printer DECKER, and published in thirty sumptuous quartos, a limited number only being issued for presents or deposit in the royal libraries. MENZEL’S designs were engraved by Herrn UNZELMANN, H. MÜLLER, ALBERT and OTTO VOGEL, whose woodcuts were justly accepted by the artist as perfectly satisfactory reproductions—a judgment which the general public has now the opportunity of endorsing. The present Emperor may be said to do the distinguished Prussian artist, whom Berlin delights to honour, an act of justice in the permission given to the publisher, Herr WAGNER, to issue in Germany and France a limited edition, of 300 copies in all, of the collected illustrations, printed afresh from the original blocks, under the superintendence of Professor O. VOGEL, one of the original band of engravers. These designs have been for the public, practically unattainable heretofore, but now can at any rate be studied in the chief art libraries of Europe. The text by Herr PIETSCH prefixes to each vignette the title of the literary performance illustrated, and gives a few words as to the especial point selected by the artist, and his manner of throwing it into artistic shape. The name of the engraver is also given in each case. A straightforward preface and good indexes make the publication complete.

ADOLF MENZEL was rather more than six years over the designs. He had an immense deal in the way of preparation to do: manuscripts to examine, historical data to look out, old prints to consult, museums and collections to visit; correct portraiture, correct costume, and truth in all narrative details, compelled such time-consuming research. The actual work upon the blocks, even the invention of the designs, would, with an artist so sure-handed and so ready, take but a portion of the whole period. Other men would have evaded all the accuracy to which MENZEL bound himself; but not only was he under surveillance to do dutifully the Royal commission, his own spirit also was eager in its fulfilment, and his own style—which, as he says himself, is comprehended in “the round word ‘naturalism’”—implied a certain close veracity and historic completeness. A large proportion of these illustrations are portraits of the famous or infamous men and women with whom FREDERICK had to do, and these are taken from reliable sources, and are no mere fancy affairs called up out of nothing. They are, however, not slavish copies, but treated with reference to the particular incident or mood indicated in the context. It must be allowed, however, that in these vignetted portraits the very fidelity with which MENZEL has re-echoed, so to speak, the effigies found in contemporary graphic records has also checked his individuality, and it is only here and there that a special finesse and vigour marks the heads as drawn by a modern master of character.

In the rough the four volumes are divided into—I. Illustrations of historic incidents; II. of philosophic writings; III. of satiric and complimentary verses, and intimate letters; IV. of instructions and miscellaneous correspondence. If one thing more than another could prove the inventiveness of a designer, it is the power to embody the meaning or find a suggestion for graphic representation in the literary material here set forth for illustration. The merest thread of subject matter is seized hold of and cleverly magnified and adorned; or, reading between the lines, the artist finds suggestions in a suggestion, and creates a fresh thought out of the most unlikely material. Both the shortcomings and the strength of MENZEL’S art become evident in these designs. In aiming at the fanciful and the graceful, he is sometimes deplorable, often ridiculous; his classical gods and goddesses are inane and stilted; his allegorical designs are, when ambitious, strained or

\* “Illustrations des Œuvres de Frédéric-le-Grand.” Par Adolphe Menzel. Gravées sur bois par O. Vogel, A. Vogel, F. Unzelmann et H. Müller. 200 Feuilletts avec texte de L. Pietsch. Berlin, 1882. R. Wagner, éditeur.

trivial ; but, on the contrary, when he embodies in analogy, after the manner of emblems, his designs are compact and vigorous. Take, for example, the illustration to the letter on "Human Wishes": a bird-cage through which a branch of fruited cherry is thrust ; the feathered prisoner in the cage, heedless of the berries, beats against the bars to find freedom, while the wild bird outside is as vainly striving to force its way into the cage to get at the fruit bunches. The apt completeness of the thought here is only equalled by the clear mastery of the design. Or, again, take the emblem symbolising the coalition of France and Austria against Prussia, by the claws of ravenous birds clutching into the globe over which hovers the crowned eagle of Prussia ; or, once more, the vigilance of Prussia watching for her opportunity to attack the Austrian enemy, embodied in the lithe form of a lion, mane bristling, tail a-flourish, which courses around the Austrian elephant, standing vigilant but immovable in the centre, with trunk laid to the ground. This is an excellent example of MENZEL'S wonderfully crisp vigour of line and power of apposite expression.

It is not a little amusing that the keen satire of the artist, which plays often at the expense of the hero he has been called upon to glorify, should have escaped censure from his patrons. He has commented upon one of FREDERICK'S grandiloquent discourses to crowned heads on the duties of sovereigns by representing the hero with his back to us rising from his chair in an oratorical frenzy, regarded from either side by the Empresses MARIA THERESA, and CATHERINE with mocking surprise ; while his royal hearers are for the most part snoring in their easy chairs in the shadowy background. When the King addresses complimentary epistles to the Countess CHATELET, the artist represents the poor lady as a sentimental owl, perched on a tripod, inhaling incense. FREDERICK'S formal rules of instruction to his officers are cleverly commented upon by scenes in which they would be useless or impossible ; the lamed cavalry officer with his lamed horse finds himself in no case to carry out the royal advice, and the officers who are commanded to keep the infantry on the march from stopping to drink water by the wayside are shown by MENZEL in vain struggles to restrain the thirst of a parched battalion who are plying the buckets of a draw-well. One of the neatest comments of the illustrator upon his royal author is the admirable design to illustrate FREDERICK'S diatribe upon MACHIAVELLI : a portrait of the Italian satirist is nailed to a pillory with the date of the king's refutation of "The Prince" scrawled below, but the artist signifies the change in public opinion by crowning the effigy with bay and laurel, and affixing the date, 1848, which reversed the censure of FREDERICK. The expression of superb indifference thrown into the pictured head of MACHIAVELLI is a good example of MENZEL'S drawing of character. In the fourth volume is another instance in a study of VOLTAIRE lying under funeral trappings and wreaths, with the old mocking smile still contorting the dead upturned face.

We have alluded to the failure of MENZEL to be impressive when dealing with classical allusions. His admirers say that he is simply laughing in his sleeve at the affectations of the modern classicists ; this, however, does not wholly excuse the absurdity of, for example, his winged Victory who announces the triumphs of FREDERICK to the Dowager Mother, an old dame in flounce and cap, reposing amid her invalid cushions. The apposition of the figures is in the worst style, and throughout the whole of this series of designs we do not find a single instance in which the classic myths are used otherwise than feebly, or with grotesque vulgarity. As an instance of the last, take ÆSCULAPIUS, his serpent-twined staff thrown down, struggling with ATROPAS for her fatal scissors, which the old hag, though dragged from her seat along the floor, still stoutly clutches. The fact is that MENZEL'S style is founded entirely upon study of common actual human nature. The Greek ideal of the nude form is naught to him, but he will draw a naked prize-fighter or a brawny peasant with magnificent energy. His *Venus* is a German frau without clothes, or else a mere lifeless puppet. His *Germania* watching the storm-clouds rave about the crag on which she sits throned is a buxom actress. The strength of the artist is in the real and the human ; his sure hand will render for us the slightest and subtlest line which expresses pathetic or combative or humorous emotions of the individual, natural, human, kind ; but ideal grace or nobility, or even the selected beauty which comes nearest to typical excellence, these are beyond and out-

side his strivings. The same lack is apparent in his decorative designs ; he has really no understanding of ornament ; his forms are *rococo* or simply naturalistic ; and it is only his abundant invention and drollery and sense of relative line and apportionment of space which make his famous title-pages and borders admirable art as well as significant fancy.

From these strictures, which the extravagant idolatry expended upon MENZEL in some quarters arouses one to make, we turn willingly to full admiration of the artist in his own *genre*, and for his more technical excellences. His line is unimpeachable for energy and expression ; his style ignores no fact in nature—it does not translate but reproduce. As Mr. HERKOMER points out, MENZEL takes account of colour, tone, texture, accident : in this wholly differing from the early designers for woodcut, who interpreted and symbolised. The truth and finesse of his realism and the dramatic quality of his narrative power are equally amazing ; his capacity for expressing space, and the relation of objects in perspective value, is not surpassed. He depicts animals with the knowledge of a zoologist, and human beings with the insight of a philosopher. The finest designs in the volumes before us deal with incidents of the battle-field, the camp, or the court, and the same remark was true of the illustrations to the "Life of Frederick the Great." One design, however, we will name as an example of the more profound pathos to which MENZEL occasionally lends his pencil. In vol. ii. he illustrates the Ode on Firmness by the figure of GALILEO in prison, who finds his chain too short to permit him to reach with the rusty nail he holds in his hand the bare space of wall yet unscrawled by his mathematical problems. The attitude and expression with which the philosopher turns to regard the hindering fetters, the simplicity and yet completeness with which the whole scene is brought before one, reveal that higher kind of imagination which belongs to the poetic artist.

It only remains to speak of the admirable quality of the engravings in the volumes before us. The work has been pretty equally assigned to the four artists : HERR UNZELMANN undertook fifty-one cuts ; HERMANN MÜLLER, twenty-nine ; ALBERT VOGEL, forty-six ; OTHO VOGEL, fifty-five ; and nineteen were jointly cut by MÜLLER and UNZELMANN. Finer and cleaner execution it were difficult to find ; now and then a certain poverty of effect is due to the delicate unshaded pencil-point work of the artist, which has simply been followed accurately in depth and delicacy. The blacks in the cuts of A. VOGEL and UNZELMANN are excellent in variety, and the graduation of tone and intricacy of lines reproduced in some of the more complicated engravings are of the finest direct work ever executed. The spirit, the spontaneous fling of MENZEL'S touch while at his best, has taxed successfully the responsive skill of his engravers.

## THE ART OF THE BLACKSMITH.\*

By G. H. BIRCH, A.R.I.B.A.

IT is not the intention of the present paper to endeavour to trace the actual working of iron from primæval times, from those remote ages when the ever busy and inventive mind of man first conceived the idea of separating the metal from the ore, and impressing upon the shapeless mass those forms of offence or defence, or of domestic use, which occasion required or fancy dictated. Legends, both sacred and profane, point retrospectively, the former to a "Tubal Cain," and the latter to four successive ages of gold and silver, brass and iron. Inquiry stops on the very edge of that vague and dim horizon of countless ages, nor would it be profitable to unravel myths or legends, or to indulge in speculations upon a subject so unfathomable. Abundant evidence is forthcoming not only of its use in the weapons, utensils, and tools of remote times, but also of its use in decorative art ; unfortunately, unlike bronze, which can resist the destructive influences of climate and moisture, iron—whether in the more tempered form of steel or in its own original state—readily oxidises, and leaves but little trace of its actual substance behind, so that relics of very great antiquity are but few and far between. It remains for our age to call in science, and protect by a lately-discovered process the works of art in this metal, and to transmit them uninjured to future ages.

In the retrospective history of the blacksmith's art no period was richer in inventive fancy than that period of the so-called Middle Ages. England, France, Italy, and more especially Germany, vied with each other in producing perfect wonders of art. The anvil and the hammer were ever at work, and the glow of the forge with its stream of upward sparks seemed to impart,

\* A paper read at the special visit of the Architectural Association to Messrs. Gardner's, West Strand.

Prometheus-like, life and energy to the inert mass of metal submitted to its fierce heat. Nowhere at any period were the technicalities of iron so thoroughly understood, and under the stalwart arm of the smith brought to such perfection, both of form and workmanship, as in Europe during this period of the Middle Ages.

The common articles of domestic use shared the influence of art alike with the more costly work destined for the service of religion; the homely gridiron and pothook could compare with the elaborate hinge of the church door or the grille which screened the tomb or chapel; the very nail head was a thing of beauty.

Of articles for domestic use of a very early period handed down to our times we have but few specimens, and this can easily be accounted for: the ordinary wear and tear and frequent change of proprietorship and fashion, in addition to the intrinsic value of the metal, contributed to their disappearance. "New lamps for old ones," is a ceaseless, unchanging cry from age to age. In ecclesiastical metal-work of course the specimens are more numerous and more perfectly preserved; their connection with the sacred edifices which they adorned and strengthened proved their salvation.

Without going very minutely into the subject of arms and armour, it is absolutely necessary to refer briefly to the use of iron in that most important element, in the protection of the human form, before the introduction of more deadly weapons in the art of slaying rendered such protection useless. In the Homeric age such coverings seem to have been of the most elaborate and highly wrought character, for, although Achilles may be purely an hypothetical personage, Homer in describing his armour probably only described such as was actually in use in his own day, and may have only slightly enriched it with his own poetic fancy. From the paintings on vases we know that sometimes rings of metal were used sewn on to a tunic of leather. They may have been bronze, but there is also every reason to believe that they sometimes were of iron. Polybius asserts that the Roman soldiers wore chain-mail, which is sometimes described as "*mollis lorica catena*," and we find innumerable instances on sculptured slabs of this use, and in London, amongst some Roman remains discovered in Eastcheap and Moor Lane, actual specimens of this ringed armour occurred, in which the rings did not interlace as in later specimens, but were welded together at the edge. From this time there is authentic evidence of its constant use. The Anglo-Saxons wore it, as it is frequently described in manuscripts of this period. Later on, the Bayeux tapestry represents it beyond the shadow of a doubt, both in the manner as before described and also in scales overlapping one another; while the helmet of a conical shape, with a straight bar in front to protect the nose, is also very accurately figured.

What we call chain-mail proper did not appear before Stephen's reign, and its introduction followed closely after the first Crusade, and was doubtless derived from the East, where the art of working in metals had long been known and practised. The very term "mail" means hammered, and from Stephen's time until that of Edward III. it was universally used; but long before the last-mentioned period many improvements suggested by a practical experience had modified the complete coat of chain-mail. Little by little small plates of iron fastened by straps and buckles to the chain-mail, to give additional safety to exposed portions of the person, gradually changed the appearance, and developed at last into complete plate armour, such as is familiar to us by the many monumental brasses and effigies still extant; the chain-mail being only used as a sort of fringe to the helmet, covering the neck, and as an apron, until even this disappeared, although it was nearly the end of the sixteenth century—so far as Europe is concerned—before the chain-mail finally vanished.\* After this date armour became more elaborately decorated by other processes besides those of the armourers' or smiths' inventive genius. Damascening, gilding, and painting were extensively employed, and more especially engraving or chasing; and the collections at the Tower—and more particularly the rich collection formed by her Imperial Majesty the ex-Empress of the French at Pierrefonds, now at the Hotel des Invalides—show us to what a wonderful extent this ornamentation of armour could be carried. The seventeenth and eighteenth centuries still gave employment to the smith, until the utter inability of such a protection against the deadly bullet rendered its further use ridiculous, and in these days it only appears in England in a modified form of a cuirass in the showy but splendid uniform of the Horse and Life Guards,† or occasionally in the Lord Mayor's Show, when the knights of old are represented by circus supernumeraries, as unlike these ancient prototypes as the tin armour in which they are uncomfortably encased resembles the ancient. With the armour the weapons used by its wearers have been handed down to our times, and magnificent specimens they are of an art which, although it may not be entirely dead among us in these days, is certainly dormant as far as this branch of it is concerned. The massive sword of the early mediæval period, which depended on its own intrinsic weight and admirably-tempered edge rather than on its ornamentation; the maces, battle-axes, halberds, and paltises, show a gradual increase of beauty and finish in their

workmanship. The sword and dagger hilts became more and more elaborate, especially in Germany, where the blade of the sword is often of the most eccentric form and pattern, as if it was intended more to strike terror by its appearance than by its actual application. Many of the ancient sword-hilts preserved in England, at the Musée d'Artillerie in Paris, and at Madrid, Vienna, Dresden, and Turin, are of the most marvellous beauty and workmanship that it is possible to conceive, more particularly those of the sixteenth century. Italy and France vied with each other in producing these art treasures of the craft of the smith; Milan, Turin, and Toledo were the principal seats of this industry, and in Augsburg, in Germany, there lived and died generations of men who were perfect masters in this art of the smith. The decadence with regard to the weapon was as marked as that of the armour; the handle of the sword became more and more enriched with the productions of the goldsmith and lapidary's art, until the swords became rather fitted to dangle as gilded appendages against the embroidered clocks of the silken stockings of the courtier, than to clang with martial sound against the steel-encased limbs of the warrior.

It would be beyond the limits of the present paper to enumerate the many examples of ancient work in weapons and armour contained in the public museums of Europe, and also in private collections. Armour is only mentioned here to give an idea of the extent to which the art of working in iron was carried, of the perfection it attained, and how thoroughly the capabilities of metal were understood, noting well that the casting of the metal into moulds was scarcely ever practised, that it was entirely the work of the hammer and the anvil, that the different pieces were welded and riveted by manual labour of the smith, and then subsequently finished in the same manner by the various processes of engraving, chasing, and punching.

The next division of the subject is the use of iron in ecclesiastical art, and this comprises hinges of doors, locks and fastenings, grilles, screens, railings, and vases.

We have already seen to what perfection it could be brought in defending man against his fellow man; its nobler employment in the service of his Maker remains to be considered.

The church door first engages our attention, the framing of the door requiring additional strength beyond the ordinary mortising, dovetailing, and tenoning of the wood, and this additional strength was imparted by the use of iron, and so completely was this attained that we have only to turn to numerous examples, still existing, to prove the manner in which it was done and the form it took. The hinge was usually constructed in the following manner:—A strong hook was built into the wall with forked ends well built into the masonry; on this hook was hung the hinge, which for the convenience of the illustration we will consider as simply a plain strap or flat bar of wrought iron, its ornamentation being a matter of after-consideration; this strap had at one end a hollow tube or ring of metal which fitted on to the hook, allowing the hinge to turn; the strap on the outside of the door was longer than the one on the inside, with sufficient space between the two to allow for the framing of the door and its outside planking, and the back and front straps were united by bolts, nails, or rivets, which passed through the thickness of the wood, and firmly secured all, the form of the opening in the masonry preventing, when once the door was firmly fastened by a lock or bolt, its being forced up from the hooks on which it hung. Allusion has been made to the planking, which invariably covered the framing; beside the security of the strap this planking was also fastened to the frame by nail heads and scrolls of metal, sometimes covering the whole of the outside of the door with very beautiful designs; in most cases the scrolls started from the plain strap, but sometimes they were separate. This was the usual construction, irrespective of century, which prevailed in England. On the Continent, especially in Italy, at Verona and Rome and other places, the exteriors of doors were entirely covered with plaques of bronze. A survival of the ancient classic times, that of Saint Zeno, Verona, is one of the most remarkable, and is probably of Eastern work. Although of bronze, and beyond the limits of the present paper, allusion is made to it in consequence of some of the ornamentation and nail-heads, reminding one of the earliest specimens of Norman or twelfth-century metal in England and France.

It would be difficult to decide which is really the earliest specimen of an iron hinge in this country. Barfreston Church in Kent has some early ironwork on the doors, and the cathedrals of Durham, and Ripon, and St. Albans. It would be hazardous to say that this last-mentioned specimen is absolutely Norman, although generally accounted as such; it is more probably twelfth-century. It occurs on the door leading from the south transept into the "Slype," the said door having two elaborate scroll hinges, more quaint than beautiful, the scrolls being closely set, and the foliage very stiff, the edges of the leaves being cut into a continuous chevron with a stiff curl at the termination; the main part of the band or strap, before it branches out into the scrolls and foliage, being indented with a deep line in the centre. From this the section slopes on each side, on which are engraved deeply a zigzag pattern whose point-meet forms a sort of lozenge, the sections of the scrolls and foliage being flat and engraved with a single chevron. The whole of the hinge is studded with small quatre-

\* Still used in Tartary, China, Japan, and Hindustan.

† The use of the Cuirass is preserved in French and German Armies.

foil-headed nails at regular distances, stopping the chevron pattern. On the band from which the foliage springs there is a peculiarly formed raised projection like an animal's head, slightly resembling a grille at Westminster Abbey, to which reference will be made: the hinge is either a rude copy of a thirteenth-century one, or it may be a prototype of the later and richer work of the next era. On the north door of Durham Cathedral nave there is a very fine specimen of a knocker, called the "sanctuary" knocker, of a lion or cat looking with erect ears, and surrounded by a stiff conventional mane, from which the head projects considerably; and from the mouth, which is well garnished with sharp teeth, depends a ring, the upper part of which is flattened, and at the junction of the circular and flat part on each side is the head of an animal, from whose open mouth the flat part proceeds. It is a wonderfully spirited composition with an immense deal of character about it, the deep lines proceeding from the nose to the two corners of the mouth reminding one of some of the Assyrian work. The eyes project and are pierced; it is supposed that they were filled at the back with some sort of vitreous paste, but of this there is no proof. This grim knocker played a very important part in early times, for Durham Cathedral possessed the privilege of "sanctuary," and many a poor hunted fugitive must have frantically seized the knocker and woke the echoes of Durham's holy shade, and brought by its startling summons the two Benedictine monks who kept watch and ward by day and night in the chambers above the porch, and at once admitted him into the sacred precinct, and, taking down the hurried tale in the presence of witnesses, passed him to the chambers kept ready prepared in the western towers, where for the space of thirty-nine days he was safe from pursuit, and was bound to be helped beyond seas, out of the reach of danger. The peculiarity attaching to this Durham knocker must be the excuse for this digression. Examples of these sort of knockers, although not necessarily "sanctuary" ones, are by no means uncommon. Beautiful examples exist at the collegiate church of St. Elizabeth, Marburg, at the cathedral of Erfurt in Germany, and at the church of St. Julian, Brionde, in Auvergne, France. The Erfurt example is just as grim a monster as the Durham one; the mane in each case is very similar, but it has the additional attraction of the figure of a man between its formidable teeth, the head and fore part of the body, with uplifted arms, projecting from the mouth; but the ring is plain, and it has an additional twisted cable rim encircling the mane.\* Farringdon Church, Berks, possesses a very beautiful specimen of early metal-work in the hinges on one of its doors, very much richer in detail than the St. Albans example, a photograph of which is shown. Roughly speaking, there are two hinges of not quite similar design, with floriated scrolls and a very rich band or strap between them, floriated at each end, and at the apex a curious perpendicular bar terminating at the lower end in the head of an animal, and at the upper with scrolls fitting to the shape of the arch; the whole of the hinges, bands, and scrolls are thickly studded with nails and grotesque heads and beaten ornaments. The church has been restored; the stone carving, which is of early thirteenth-century character, is entirely modern, and therefore misleading, and must not be taken as the date of the door with its metal-work.

At Staplehurst Church, Kent, there was formerly on one of the doors a very characteristic Norman hinge, of a very early type; but this church has also undergone restoration, and a friend, to whom we are indebted for the photograph of the Farringdon example states that this hinge was not there at his last visit; but in general form it resembled one at Edstaston Church, Shropshire, which retains its original hinges on the north and south doors of the nave. There are many other examples scattered about England, but all these Norman or twelfth-century hinges follow more or less the same idea—a broad strap terminating in scrolls, and whose end next the stonework is intersected by another broad strap forming nearly two-thirds of a circle, with scrolls at the ends; and between the two hinges by which the door is actually hung, there is one or more flat bands, also floriated, the ironwork protecting the whole surface of the woodwork, but not so completely as in the next era.

In France the work was, like the architecture, a little more advanced. Foliage was more extensively used, the scrolls generally finished with a well-moulded leaf or rosette; but the form of the scrolls is still stiff and lacks the graceful flow of the thirteenth century.

Some of the best specimens are preserved at the cathedrals of Angers, Le Puy, Noyeau, Paris, and many others, especially at the Abbey of St. Denis.†

\* Durham Cathedral, on the south door of the nave, has some fine ironwork hinges of rather heavy design, and ornamental work of three interlaced lozenges, the centre one having an open quatrefoil; from which proceeds, like the four arms of a cross, elaborate scroll foliage, the whole composition reminding one of some of the work in the twelfth-century illuminations.

† Notre Dame de Paris preserves its original ironwork on the two lateral western porches: that on the north-west is called *Porte de la Vierge*, and on the south-west *Porte de Ste. Anne*. The centre western doorway is entirely modern. According to local traditions, the blacksmith who forged the work on the two first-mentioned doors was no less a personage than the Devil himself, making the usual contract with the workman for

In addition to the metal-work on the doors, in many of the large churches in France of the twelfth century, the large wheel windows are filled with ornamental iron grilles. Noyeau has a noted example. These grilles were more particularly used when there was no tracery, the ramifications of the iron-work almost supplying the want of it. Viollet le Duc in his *Dictionnaire Raisonné* gives a very beautiful example of this. The grilles referred to are not the iron frames in which the twelfth and thirteenth century stained glass is contained, as at Canterbury, Bourges, and Chartres, and in innumerable other instances; but were designed especially to fill these large circular openings, and the effect is very beautiful.

(To be continued.)

## THE BRITISH MUSEUM.

ACCORDING to the returns in the annual report, the number of persons admitted to view the general collections was last year 764,405, while in the year before it was 655,688. In some of the special collections there was also an increase. This is to be explained by the greater number of hours during which the museums are open.

The transference of the natural history collections to South Kensington has not been continued during the year 1881. The department of zoology, which still remains at Bloomsbury, is of an extent fully equal to the united departments of geology, mineralogy, and botany, which were removed in the year 1880, and it is a work of time to provide the new cases required for the specimens. It is considered unadvisable to move any part of the zoological collections until the whole of these fittings are prepared. Rapid progress is being made with them, and it is hoped the galleries may be completely furnished and made ready to receive the bulk of the collections by the autumn of the present year. But for one important portion of them—the specimens preserved in spirit—a distinct building separated from the main edifice has yet to be erected, and it is doubtful whether this can be effected before the setting in of the winter. These specimens are so essential a part of other collections that to separate them by leaving them at Bloomsbury, after removal of the general department, would be to render it impossible to make use of either portion for scientific study. It is doubtful, therefore, whether the removal of the zoological collections can be effected before the spring of 1883.

During the year 28,284 volumes were added to the Library, including 8,622 received in pursuance of the law of copyright. Among the additions to the manuscripts are sixteen volumes of illuminated Bibles, Psalters, Hours of the Virgin, of the thirteenth-fifteenth centuries, bequeathed by the late William Burges, A.R.A.; the Guild-book of the Barber-surgeons of the city of York, commenced in the fifteenth century, and containing drawings of that period and a series of coloured portraits of English sovereigns from Henry VII. to Elizabeth, by different hands of the sixteenth century, continued by later additions down to George III.; final concord relating to property in Stratford-on-Avon, and elsewhere, formerly belonging to William Shakespeare; genealogical and heraldic collections of James Torre, of Snidall, *ob.* 1699, relating chiefly to Yorkshire and the northern counties of England—seventeenth century; "Analecta Eboracensia," collections relating to the city of York, by Sir Thomas Widdrington, Recorder of York, *ob.* 1674.

The keeper of the Department of Prints and Drawings reports that a descriptive catalogue has been prepared by Mr. R. Fisher of the Early Italian prints, nielli, and sulphur casts in the Department, which have been temporarily rearranged for the purpose. This collection of the works of the painter-engravers who flourished in Italy before the establishment of a school of professional engravers by Marc Antonio, greatly exceeds in value and comprehensiveness every other of its kind in Europe. The following purchases have been made: Italian school, 136 examples; German school, 495 examples; Dutch and Flemish schools, 81 examples; French school, 1,396 examples; and English school, 1,380 examples. Among the last are an extremely curious and interesting view of the baths at Bath, with the buildings round them, as they appeared in the reign of Charles II., showing people bathing and others looking on, drawn in pen and Indian ink by T. Johnson, an artist of the period who is mentioned in Walpole's "Anecdotes"; two large volumes of chalk drawings from the human figure and the Elgin Marbles, by Benjamin Robert Haydon, the historical painter; a volume of drawings, chiefly from paintings in the catacombs at Rome, executed by Thomas Heaphy to illustrate his work "The Likeness of Christ"; a whole-length portrait of John, Duke of Marlborough, in pen and Indian ink, on brown paper, by Michael Dahl, with Horace Walpole's autograph; and two marine views, drawn in water colours by Augustus Hervey, Earl of Bristol.

his soul after death. The name this demoniacal workman went by was "Biscornette," alluding to his horns, he thereby hoping to effectually block the doors to prevent the egress of the Blessed Sacrament. Tradition further says that he never succeeded with regard to the central doorway, and the fact of the south-western door being never opened was looked upon as a proof of this. The Devil in the Middle Ages seemed particularly partial to blacksmiths, as witness St. Dunstan and his legends.

One of the additions to the Assyrian collection is a slab of grey stone about 1 foot high by 9 inches wide, found at Abou-habba in an earthenware coffer. Abou-habba, the site of the ancient Sipara, was a city of considerable importance in ancient times, and was the special seat of the worship of Samas, the sun-god. Close to the Sipara of Samas was another town called Sipara of Anunit, the seat of the goddess Anunit, and it is thought that this twofold Sipara gave rise to the dual Sepharvaim of the Old Testament. Sipara of Samas was specially celebrated as being the town of books or tablets. This stone contains a long inscription in six columns, and, at the top of the obverse, a representation in low relief of a shrine in which the sun-god is shown sitting. Above the shrine are two small figures, who seem to be guiding with cords the course of the sun, which stands on a kind of table below them. Servants of the sun-god lead into his presence a worshipper who is most likely the king Nabû-abla-iddin, by whose order the stone was cut. The workmanship of the whole is very fine and in perfect condition. The inscription, which covers the rest of the obverse and the whole of the reverse, begins by mentioning the wrongdoings of the Sutû, an invading tribe, who seem to have carried off the property of the temple of the sun-god (called E-barra) at Sipara, and destroyed the sanctuaries, in the time of Simmas-Sikhu. The restoration of the temple, begun by Simmas-Sikhu, was continued during the reign of Ê-Ulbar-sakin-sumi, and ended by Nabû-abla-iddin, the king who had the slab carved. A long description is given of the repair of and additions to the shrine and temple, and the founding of a shrine for the sun-god in Bit-kar-zagina beside the Euphrates, where victims were offered, and honey and wine bestowed. The inscription speaks also of the services of the temple called Ê-barra. The slab is dated at Babylon, the 20th of Nisan, in the 31st year of Nabû-abla-iddin, king of Babylon. During the course of years the stone got broken, and was riveted together with iron, most likely in the time of Nabopalassar, who made the earthen coffer in which to keep it, and an inscribed covering to protect the bas-relief.

The Department of Greek and Roman Antiquities has acquired among other examples a fictile kylix, on the inside of which are represented Athenê and Hephaestos making Pandora, the names of all three figures being inscribed on the vase. The hair and draperies are painted in brown and purple with gilt accessories; the flesh is drawn in fine lines on the white background. The drawing of these figures, though slightly archaic, is very masterly, the colours harmoniously blended, and the condition of the vase excellent. This exquisite specimen of ancient fictile art was found in 1828 at Nola in Campania. Polychrome designs of this kind, on a white ground, are of extreme rarity.

The Department of British and Mediæval Antiquities has been enriched by the specimens selected from the collection of the late William Burges, including a number of objects of great value to the Museum, and chiefly of a class ill-represented. Among the miscellaneous objects may be noticed a Roman glass bottle with a gold rim; two Byzantine gold earrings, one of them with enamelled birds; a crystal spoon set in silver gilt; a cinque-cento ring enamelled; six tablets carved in ivory, chiefly of the fourteenth century; five caskets of early date, one of them Italian, carved in bone with the history of Jason; four specimens of Saracenic metal work, two of them writing-boxes of the fourteenth century, inlaid with gold and silver; and a Chinese bronze stand, also inlaid with gold and silver. The most extensive portion of the bequest consists of armour, and especially of helmets. The series of European helmets selected is twenty in number, commencing with a bascinet of the middle of the fourteenth century; and several of them formed part of the Meyrick collection. Among other examples of armour may be noticed a half-suit believed to have belonged to a king of Poland, and a half-suit of scale armour; two very fine engraved breast-plates, and specimens of the secret armour known as Jazerine and Brigandine. In the Oriental section are some fine helmets; a shirt of mail with passages from the Koran; some curious Tatar helmets and gauntlets; and an old Japanese suit. The whole number of specimens comprised in Mr. Burges' bequest is one hundred and seventy.

#### EXHIBITION OF ANCIENT IRONWORK.

A VISIT by invitation was paid by members of the Architectural Association on Saturday afternoon last to the premises of Messrs. Gardner, West Strand, to inspect a loan collection of ancient wrought-iron work. After the inspection of the collection a paper on "The Art of the Blacksmith" was read by Mr. G. H. Birch, A.R.I.B.A., Hon. Secretary of the London and Middlesex Society, which appears in another part of the paper. On conclusion of the reading, votes of thanks were, on the proposition of Mr. E. C. Robins, F.S.A., and seconded by Mr. Nash, unanimously passed to the author of the paper, as also to Messrs. Gardner and the various owners of the works lent for exhibition.

The examples of works are numerous, and may fairly be said to have been representative of the works of the smith for several centuries. Messrs. Gardner undertook the great labour of collecting specimens and organising the exhibition as an experiment. Heretofore wrought-iron work has not been properly represented in

exhibitions, and the reason is obvious. Ornamental ironwork generally forms a part of a building, and can be removed with difficulty. It happens consequently that while the work of enamellers, embroiderers, potters, and goldsmiths is familiar to visitors to museums, little is known about smiths' work, unless when it is represented by arms and armour. Messrs. Gardner's exhibition is intended to be indicative of what is possessed by collectors in this country, and thus to prepare the way for an exhibition on a larger scale under the auspices of the Ironfounders' Company.

Among the earliest examples are some Roman keys. They are not particularly artistic, but they are interesting as showing the extent to which iron was worked in those days. Coming to later work, there are specimens of wrought chain-mail of the thirteenth century, interesting as showing two different methods of working the links. Belonging to the fourteenth and fifteenth centuries are fine examples of treasure caskets; and hinges of German work, showing the rigidity of line which is still peculiar to the German craftsman; also German and Flemish hingework of the sixteenth century on carved panelling of aumbrey doors, a period when it was the fashion to cover the wood profusely with hingework. The increased fineness of execution in work of the later dates is noticeable in a remarkable Renaissance casket of delicate *repoussé* workmanship. The outer sides exhibit figures in niches or canopies; subsidiary panels below also containing figures. Between the canopies are pilasters, which carry the entablature, the architectural design representing a temple, the various parts being jointed and fitted together with marvellous perfection; the top of the lid is surmounted by a recumbent figure in solid metal. The casket, however, appears only to have been lent for the special occasion on Saturday. Rivalling this in beauty of execution is a master-key for keeping other keys under lock, which is said to have belonged to Mary Queen of Scots, and has been lent by Mr. Truefitt. The ornament could hardly be more delicate if the material were lace. Conspicuous in the handle are finely-wrought initials, and a little inspection reveals a carefully-designed thistle. Two quaintly-worked keys date respectively from the time of Edward IV. and the French King Louis. A remarkable *repoussé* copy of the picture after Vandyke, representing the children of Charles I., and which probably was English work, was valued at 400*l.* A curious specimen of German work is seen in a bracket, intended probably to hold a sign; and there is a quaint bracket, a lift for font cover, from St. Michael's, Queenhythe. A pendant for a chandelier from St. Catherine Cree is said to have been designed by Inigo Jones. There are several examples of grilles. A French work, of the date of Francis I., in which the reticulations are formed into *fleurs-de-lys*, is of marvellous beauty. A grille of flat Venetian work is worthy of notice, examples of this class being unknown here. A Florentine balcony of the seventeenth century shows a fine specimen of interlacing work. Among the interior fittings deserving of attention are a piece of Italian staircase and handrail work, fireplace furniture with cressets for holding charcoal, hooks for suspending pots, taken probably from a guardroom, fire-irons, dogs, &c., exhibiting much elegance of design. A pair of fire-dogs of Venetian workmanship are adorned with a profusion of flowers cut out in the metal; the effect is curious if not quite satisfactory as far as fitness of purpose goes. A wrought-iron chest of elaborate execution occupies a prominent position, the property once of some royal personage doubtless, from the crown upon it. Near it are two oak travelling chests of massive proportions, one marked with a cardinal's seal; the woodwork is largely covered with ornamental bands and scrolls. There are several examples of the art of the armourer; among them is a sixteenth-century stiletto with punctures in the blade to carry poison. It may be described as a fluted or a four-edged weapon, the edges, moreover, being slightly turned over. The addition of poison to such a murderous-looking implement seems almost like carrying coals to Newcastle. An Elizabethan dagger with priming pan is probably unique, though perhaps not uncommon at that period. In the collection of rapiers the ornamentation of the hilts is worthy of inspection. A double candleholder with shade, besides showing merit of its own, is interesting as having belonged to William Hogarth. A Nuremberg door-knocker representing the arms of Austria, among elaborate examples of these articles, is shown. The bare reproduction of such work of art in these days would scarcely be possible. It is lent by Mr. Alfred Newman (Messrs. Gardner's representative), to whose energy is largely due the success of the exhibition. Also lent by Mr. Newman are a specimen of a Queen Anne bracket, the richness of the work in which is altogether unique, and a "swag" of the utmost delicacy of execution. Besides Mr. George Truefitt, other architects have made valuable loans, among them may be mentioned Messrs. Bodley & Garner, who have sent some examples of hingework; Mr. Shoppee, whose collection is of great value; Mr. Pritchett, treasure-caskets, &c.

In closing a hasty comment on a few of the objects in a collection which appears to cover the whole range of the work of the smith, attention may be drawn to the modern work produced by the firm, the design and execution of which accord well with the spirit of the old work.

## NOTES AND COMMENTS.

MR. CHARLES HEATH WILSON, the artist, died on Monday last in Florence, where he resided for several years. He was at one time master of the Glasgow School of Art, and some of the lectures he delivered to the students, and which have been published, may still be read with interest. It was partly through Mr. WILSON's exertions that the numerous windows in the Cathedral were filled with stained glass. While in Florence he entered on an investigation of the documents relating to MICHAEL ANGELO, and produced the excellent biography which has been published by Mr. JOHN MURRAY. Mr. WILSON lately co-operated with Mr. R. P. PULLAN in preparing a design for the decoration of the dome of St. Paul's. His services to Italian art were rewarded by his enrolment among the Knights of the Crown of Italy.

DURING the discussion in the French Senate on the vote of 2,000*l.* for pulling down and removing the ruins of the Tuileries, already passed by the Chamber, M. JULES FERRY, the Minister of Education and Fine Arts, made an important declaration. In reply to the objections of M. WALLON, who urged that the present tendency of the Republican Government appeared to be to destroy all relics of past *régimes* without putting anything in their place, M. FERRY remarked that in the opinion of the Government, when once the demolition was complete, the necessity of replacing the Palace by some other building would become evident to everyone. It was proposed, he said, to erect on the site a building for the reception of works by modern masters, thus relieving the Luxembourg, which is overcrowded with paintings, and at the same time forming a fit pendant to the neighbouring Louvre Museum.

THE students at South Kensington who are ambitious to become art masters appear to be degenerating. Very few of them are able to pass the examination that is requisite in order to gain a certificate. In 1881 there were twenty-eight candidates examined, and only six passed in outline drawing, eight in model drawing, and thirteen in ornament; or, in other words, about two-thirds of the drawings were ineligible, and we believe not one full certificate was awarded. Some of the rejected aspirants went up again for examination lately, and in the same subjects. Out of nearly forty students only three were competent to pass in outline drawing, eleven were successful in model drawing, and five in ornament. The defeat becomes more remarkable when it is known that some of the students have heretofore officiated as teachers, and that others have obtained prizes for the art subjects in which they failed at South Kensington. The duty of the authorities becomes clear under the circumstances. There may be remonstrances and explanations from the friends of the students, but we trust that they will not have the effect of lowering the standard set up by the examiners.

Two architects of eminence have died during the week. Mr. JOSEPH ALOYSIUS HANSOM gained a position fifty years ago by his design for the Town Hall in Birmingham, which at the time was considered a remarkable work. He undertook the erection of the building, and, as commonly happens when architects and engineers become contractors, with no profit to himself. While in Birmingham Mr. HANSOM invented the cab which has been called the gondola of London. Soon afterwards many churches and convents were erected by Roman Catholics, and several of them were entrusted to him. Two of his largest buildings are the church of the Holy Name at Manchester and St. Philip's Church at Arundel, which might serve for a cathedral. Mr. GEORGE SOMERS CLARKE, who died on Tuesday last, designed some important works. Among them are the Seamen's Orphan Asylum at Snaresbrook, the Credit and Discount Company's offices in the City, the splendid mansion of the late Mr. HERMON at Wyfold Court, and the Turkish baths in Jermyn Street.

THE International Exhibition of the Union Centrale des Arts Décoratifs, to be opened next month at the Palais de l'Industrie, is now being rapidly organised. All the best known names of Parisian and French art fabrication are already inscribed among the exhibitors.

M. JULES FERRY has authorised the managing body of the Mobilier National to organise, in connection with the foregoing, a subsidiary Exhibition of the furniture, hangings, &c., contained in French public buildings, presenting any artistic or historical interest. Several large rooms will be arranged in this way, each one being fitted up in a different style, from the Louis XIV. down to that prevailing at the beginning of the present century. It has further been arranged with the various Ministers that the Union Centrale shall have at its disposition for purposes of this Exhibition the antique furniture, fittings, &c., in which the various Government offices and buildings are so rich, on condition that any articles removed shall be replaced for the time being by ordinary furniture at the expense of the Union.

A NEW system of electric lighting has been tried on the Eastern of France Railway. To an express train running to Bar-le-Duc was attached a waggon fitted up with voltaic piles, and connected by means of wires and electric lamps in the carriages. When passing through the tunnels, the electricity being transmitted to the lamps, each compartment was at once brilliantly lighted. The experiments were considered satisfactory.

AT a late meeting of the Paris Municipal Council, the proposed grant of 10,000 francs towards the expense of erecting the cast of M. FALQUIÈRE's group, *The Triumph of the Revolution*, on the Arc de Triomphe, came up for consideration, but the Council refused approval. The whole charge of this costly experiment, estimated at from 30,000 to 40,000 francs, will therefore have to be borne by the sculptor himself.

A DEPUTATION from the Royal Institute of British Architects presented a memorial to the Metropolitan Board of Works at the meeting which was held last week. It related to the proposed improvements at Hyde Park Corner. Mr. HORACE JONES addressed the Board in support of the memorial, and said that the deputation came in no hostile spirit of criticism to oppose the plan which had been proposed by the Chief Commissioner of Works, but to point out to the Board, by reference to a plan which he produced, how the same advantages could be obtained at a saving of from 15,000*l.* to 20,000*l.* If that could be made clear, he thought that the plan would commend itself to the attention of the Board, and in order that the Board might thoroughly understand the plan, he asked that one of the members of the Royal Institute of British Architects should be allowed to attend a committee of the Board to explain it. The chairman said the Board had already agreed to contribute towards the scheme propounded by the First Commissioner of Works, and he thought this application came too late. Mr. HORACE JONES said the plan proposed by the First Commissioner of Works included the removal of the Duke of WELLINGTON's statue, and also the arch on which it is placed. If the statue was to be removed they ought to have some idea as to what was to be done with it, for not only the present Duke of WELLINGTON, but many others, would not like the statue to be sent back to the foundry. After a discussion, the memorial and plans were referred to the Works and General Purposes Committee for consideration and report.

AT the last meeting of the Société Libre des Artistes Français the protest voted at the extraordinary general meeting against Article 11 of the Statutes drawn up by the Committee of Ninety was confirmed and renewed. This Article enacts that the new Association shall be managed for the first three years by the present Committee, which may not be replaced either partially or as a whole during that period. The meeting also passed a resolution, proposed by M. FRAPPA, urging those members of the Society that form part of the Committee to bring about a meeting of that body for the purpose of reviewing and amending the Article in question. Another meeting, held last week, and attended by the sculptors belonging to the Société Libre des Artistes Français, passed almost unanimously a resolution protesting against the new regulation which changes the mode of naming the jury from choice by lot, as practised during the present year, to election in the ordinary way. It is evident from these dissensions that the new Association, to which all outsiders wish the greatest prosperity, is in some danger from dissensions among the members.

AGRICULTURE: A DECORATIVE FRIEZE.—PART II.

## THE GLASGOW MUNICIPAL BUILDINGS.

THE scheme for the erection of new Municipal Buildings on the east side of George Square, has, says the *Glasgow Herald*, made very slow progress, and in view of the delay, which, if it has been unavoidable, is not the less unfortunate, our readers will be glad to learn that at length there is a prospect of definite action being taken. About two years ago the first architectural competition, open to the whole profession, was originated. The sum then fixed as the cost of the buildings for which designs were invited was 150,000*l*. It was thought at the time that the limitation to this amount was unfortunate, and in the end it proved to be so, for all the designs sent in were of such a character that a much larger outlay than that fixed by the Town Council would have been necessary in order to secure suitable buildings. There was nothing for it, therefore, but to abandon the scheme on this basis. Premiums were paid to the authors of the best designs, the competition which thus came to an end having cost in all about 1,500*l*. The Council next reconsidered the money question, and it was resolved that a sum of 250,000*l*. should be allowed for the new buildings, exclusive of fittings, furnishings, and internal decorations. Mr. Carrick, Master of Works, was directed to prepare plans indicating the extent of the accommodation which would be required, and with this to guide them architects were invited to forward a series of inexpensive sketch plans. This, it will be observed, was of the nature of a preliminary competition, and it was agreed to select the ten best drawings complying with the conditions laid down, and to request the authors to enter upon a second competition. They were now asked to forward complete and finished drawings, for each set of which the Council agreed to pay a fee of 150*l*. It was also arranged that in this competition the Council should be advised by Mr. Barry, of London, and Mr. Carrick, who were appointed joint assessors. The duty of the assessors was to examine the designs sent in by the ten competitors, and to report upon the four which in their opinion exhibited the highest merit, the special excellence of each to be indicated by the order of numbering—first, second, third, and fourth. The selection of the best design of the four was to remain with the Council, and this is the duty still falling to be discharged by the Lord Provost and his colleagues. When they have made up their minds as to the best design of the number, the author of it is to be entrusted with the execution of the work, assuming that the Council are satisfied as to his fitness for doing so; for it need hardly be said that it is one thing to prepare plans and quite another thing to superintend their translation into stone and lime. In the event of any insuperable objection being raised to the employment of the fortunate architect in the character of builder, the Council may select any of the other three architects, always under the guidance of Messrs. Barry & Carrick.

It was stipulated that the ten drawings in the new competition to which we have referred should be lodged with Dr. Marwick, Town Clerk, not later than May 30 last. On that date they were duly delivered, and have since been considered and adjudicated upon by the assessors, whose report recommending the four best designs of the series was submitted to a recent meeting of the Municipal Buildings Committee. In the belief, apparently, that there is wisdom in the multitude of counsellors, the committee invited all the members of Council to meet with Mr. Barry and Mr. Carrick in order to examine the designs, and a meeting for this purpose was held yesterday (Monday) afternoon, at the close of the public business of the Council. The assessors were in attendance, and gave such explanations with reference to the designs as were requested. The plans were displayed in a large room in a somewhat dingy building opposite the Mitchell Library; and as heavy rain was falling outside, with a thick, murky atmosphere, the lines of the proposed buildings were not seen under the favourable conditions of sunshine and cloudless skies shown in the designs of the architects.

The following is the report by Mr. Barry and Mr. Carrick on the plans in the final competition:—

"To the Lord Provost, Magistrates, and Town Council of the City of Glasgow.

"Westminster, June 26, 1882.

"My Lord and Gentlemen,—In accordance with our report to you on January 7 last, the authors of the ten designs sent in to the preliminary competition, and selected by us therein, were communicated with (but through agents, so that their names are still unknown to us), and they were asked whether they would be prepared to submit matured designs in accordance with the conditions for final competition approved by you. They all signified their readiness to do so, and ten sets of designs were duly received on June 1. Parliamentary work on behalf of the City of Glasgow rendered it necessary for Mr. Carrick to be in London during the month of June, but in order to be in a position to present our report to you with as little delay as possible we arranged to have the designs sent to London for us at once to examine them. We

have accordingly done so, and as the result of a very careful examination, and having made an approximate estimate of the cost to carry out each of the designs, we are now prepared, in accordance with clause 1 of the final condition, informing competitors of our functions as assessors, to place the following four designs in order of merit:—1, Viola; 2, S. Ronan; 3, Semplice; 4, Gauntlet. We have not the slightest idea who is the author of the design and set of drawings which exhibit it, sent under the motto of "Viola," which we have placed first in merit; but it is right to say that this design, in our opinion, shows great artistic excellence, while the working out of all the parts of the proposed building shown by the plan and sections are *prima facie* evidence on the part of its author of great constructive ability, and an excellent understanding of the requirements of such a building as regards arrangement, light and air, good intercommunication, sanitary and ventilating arrangements, and a due regard for economy. We have every reason to believe that this design can be carried out in an effective manner to the extent described in the conditions within the sum of 250,000*l*. therein allotted for the work.—We have the honour to subscribe ourselves your obedient servants,

"CHARLES BARRY.

"JOHN CARRICK."

A meeting of the Town Council was held on Thursday, when it was decided to adopt the design signed "Viola." The author is Mr. William Young, of London.

The following description of the designs is from the *Glasgow Herald*:—

## The Design by "Viola."

Dealing with the designs in the order indicated, the first, by "Viola," is in the Renaissance style, with frontages to George Square, George Street, John Street, and Cochrane Street. While generally following the diagram plan as originally approved of by the Town Council, the author of this design has made several important changes which are of the nature of evident improvements, enabling him, as they do, to add materially to the architectural effect of the block. The principal elevation is towards George Square. The central part forms the approach to the quadrangle, over which is the Council Chamber, well expressed by coupled Corinthian columns, backed by pilasters, and surmounted by an upper storey also formed of Corinthian columns, crowned by a pediment. This pediment has 60 feet of frontage, and the apex is 96 feet above the level of George Square, while on either side of the pediment rise two belfry towers 18 or 20 feet in height. Immediately below the Council Chamber is the entrance to the quadrangle and the main staircases leading to the floors above. The quadrangle is approached by a spacious loggia, having three wide archways, and forming a striking feature in the interior of the structure. The central archway, being intended for carriages, rises to a height of 25 feet, and it is 12 feet in width. Two side doorways, 17 feet high, and similar in style, form accesses to the main staircases. Above the central floor, occupied by the Council Chamber, are the upper and saloon storeys, lighted from the roof. The two under-storeys of this, as well as the other fronts, are treated as a basement, with massive rustic stonework, relieved with coupled Ionic columns and pilasters, between which the windows are placed. Behind the central pediment rises the grand tower to a height of 190 feet, and surmounting the apex of the pediment to the height of 96 feet. At its base, which is about 35 feet square, and for about 20 feet above the apex the treatment is plain rustic masonry, without openings. Overhead are other two courses formed of Ionic pillars, above which rises a circular colonnade of Ionic pillars. The colonnade is about 14 feet in diameter, and is surmounted by an elongated stone dome. At the base of the dome the effect is enriched, and the tower is made to graduate into the colonnade and dome by the introduction of statuary. The central front projects some seven or eight feet beyond the line of the building, and between it and the wings on either side is a recess forming a screen. The wings, which like the central front, also project beyond the screen, terminate with towers rising some 48 feet above the front balustrade.

The George Street façade has received from the artist almost as great attention as that bestowed on the elevation towards the Square. Generally, it may be stated that all round the block of buildings the third floor is architecturally emphasised. In the George Street front the Council Chamber is thus specialised, and in George Street the banqueting-hall is placed on the third floor, with double rows of massive Corinthian pillars supporting a handsome well-proportioned entablature, surmounted by a balustrade. Here, as in the other fronts, the wings are formed by a clever repetition of the tower front in George Square, and are in every way similarly treated as to projection and detail, while the harmony of design is further secured by the introduction of a screen between the wing towers and the centre. In the John Street elevation the Dean of Guild Court forms the leading feature, placed as it is on the third floor. Architecturally it corresponds with George Square, although the details are of a simpler character. Underneath are the gas and water offices with handsome entrances. Externally, the centre is surmounted by a plain pediment, flanked with balustrades along the whole length of the building. Turning now to Cochrane Street, we find that here again a correspondence of style is established with George Square and George

Street. A suite of committee-rooms occupy the third or floor of honour, marked by a repetition of lofty Corinthian pillars rising over the basement storey, and carrying a well-proportioned entablature and cornice and balustrade, with turreted belfries at the ends, which add much dignity to the elevation, and pleasingly break the sky-line. The Cochrane Street front has a doorway or carriage entrance, 22 feet high and 10 feet wide.

The leading features of the whole design may be said to consist in the handsome treatment of the third floor all round, and in the two under-storeys forming a massive basement, broken by Ionic pillars and surmounted by a bold, continuous line of cornice, a similar line of unbroken cornice being carried over the windows of the third or principal floor. The appearance of the building is relieved from all sense of flatness by the treatment of the centre and wings in the several fronts, and this feeling is further conveyed by the author having caused the upper floor all round to recede some seven or eight feet from the line of the lower storeys. This effect is obtained by the columnar formation of the principal floor. Considerable care has been taken with the quadrangle fronts, which form a most interesting architectural feature of the building. The general treatment is in strict harmony with that of the street elevations, the base being Ionic, surmounted by Corinthian pillars. Of course the design is, on the whole, less ornate than that of the fronts. As to the internal arrangements, two spacious staircases lead to the Council Chambers and the banquetting-hall. The latter is a noble apartment, 103 feet by 54 feet, having a circular ceiling 50 feet high. In connection with it there are three elegant reception saloons, which, with four saloons of a similar class on the fourth floor, will afford ample accommodation for social gatherings of the citizens, &c. The general decorative treatment of the banquetting-hall and staircase is in harmony with the leading design, the Corinthian details being finely repeated. The Council Chamber, again, is of such capacity that ample accommodation will be provided for the members and representatives of the press; while in addition there is room for the introduction of a "strangers' gallery." The dimensions of the chamber are 65 feet by 30 feet, with a recess in the centre, giving a width at that point of 40 feet. The chamber is lighted only on one side, but a circular dome supplies a plentiful supplement direct from the sun.

We may add that the elevations to George Square, George Street, and Cochrane Street are enriched by groups of statuary and statues. Fronting George Square, and including those in the tower on the apex of pediment, there are 27 groups and figures; in the George Street front there are 24; and in the Cochrane Street front about 18. John Street being mainly occupied with business offices, receives simple yet dignified treatment. The pediment crowning the central front of George Square is enriched by emblematic groups in relief, representing Britain and the Arts and Sciences; and the gateway in George Street is also relieved by carving. As indicating the effect which this building would have if we suppose it to be erected in the square as designed, it may be stated that its roof-line is 7 feet higher than that of the General Post-office, and the tower is some 55 feet higher than that of the Merchants' House, on the west side of George Square.

#### The Design by "S. Ronan."

The author of this design has likewise chosen the Renaissance style to express his conception of municipal buildings. In style and treatment it is very similar to No. 1, but the general effect is much less striking. The central portion of the main front to George Square is carried to a height of five storeys, and, like the wings, is projected. On the third floor is a series of lofty arched windows divided by pilasters, and crowning the whole is a pediment, which rises to a height of 96 feet from the level of the square. The wings, which are only four storeys high, are also carried forward to the line of the centre, and they each terminate in an elongated domed roof. The principal and most admirable feature of this plan consists in a finely-proportioned tower, which springs from the west front of the quadrangle, and rises to a height of 250 feet. From the level of the roof the tower rises in three courses, the first of plain dressed masonry, the second and third relieved by stately pillars, space being provided for a magnificent clock and peal of bells in the third course; the whole terminating with an elongated stone dome and lantern. The principal features of the main front are repeated in George Street and Cochrane Street, and the front to John Street is of a less ornate character. In the interior arrangements Mr. Carrick's block plan is generally followed.

#### The Design by "Semplice."

The author of this design has adopted a Venetian palace as the characteristic of his style. It differs from all the others mainly in the author having dispensed with a carriage entrance from George Square. Instead of providing carriage and foot entrances in his George Square front, he limits himself to one handsome foot entrance, some 30 feet high, by which the staircase leading to the Council Chamber and offices is reached. The banquetting-hall is entered by a grand staircase starting from the west side of the quadrangle, the carriage entrances to which are by George Street and Cochrane Street. This is the principal feature in which this design departs from the diagram plan, and the treatment given to it is clever and original. The George Square elevation shows an

extended front of continuous sky-line formed by the balustrade and roof surmounting the building, and broken only in the centre by a lofty tower some 250 feet in height, which is in admirable keeping with the Venetian character of the whole building, and is, in fact, a tasteful adaptation of the campanile in St. Mark's Square, Venice. In the upper portion of the tower there is a large clock dial, the two courses below the clock chamber and above the roof of the building being broken by windows. The most telling feature of the George Square front of the building proper is the third floor, which consists of a row of handsome arched windows, with pilasters between. The centre is filled up with a similar large arched window, supported by two smaller arched niches for statues. The centre of this front is emphasised by being surmounted by a semicircular pediment, filled in with sculptured subjects in relief. The windows of the second floor are square, and smaller than those on the third floor, while those of the first floor again are similar in style but still smaller. The base is partly rustic, all above being plain polished ashlar. The George Street front of this design will by many be considered more effective than that to George Square. The central portion is projected, and rises a floor higher than the rest of the building. Here the third floor is the principal one, and receives similar treatment to that of the George Square front. The floor above, limited to the centre of the front, is filled in with seven almost semicircular windows, and finished with a circular pediment in the centre. The portion of this front to the west of the centre receives somewhat different treatment in the disposition of windows, &c., from that to the east. In John Street there is only one entrance. The general treatment here is plainer than in the case of the other fronts. Pilasters are introduced at appropriate intervals, and a balustrade is carried along the roof. The Cochrane Street front is somewhat similarly displayed, the main features being a handsome carriage entrance with side doorways, a plain straight-lined pediment terminating the central portion.

#### The Design by "Gauntlet."

The design bearing this motto is also based on a Venetian palace. The leading feature in the George Square front is an elegant tower rising to a height of 250 feet; and, like that of "Semplice," it bears a strong resemblance to the campanile of St. Mark's Square, Venice. The second and third courses of this tower, which show above the roof, are utilised as bell-chambers, the clock which is placed in the first course having four dials. Immediately in front of the tower is a tastefully-conceived stone screen flanked by two square towers, each some 20 feet in height, the skyline being broken by statues. Between the designs of "Semplice" and "Gauntlet" the chief difference in the George Square front consists in the latter having slightly-projected wings, crowned with mansard roofs. Here again the third is the principal floor, and it is treated with circular windows, the windows in the wings being of considerably larger proportions than those in the body of the building. A pleasing portion of this design is a balustrade which is carried all along at the height of the roof; and a similar feature is introduced on the level of the second floor. The main doorway reaches to this balustrade and continues it; and on either side of the entrance are two huge statues or caryatides somewhere about 18 feet in height. The main features of the George Square front are reproduced in George Street and Cochrane Street; and the wings are crowned with mansard roofs. It may be added that in the centre of the principal front to George Square the words "Glasgow Municipal Buildings" are shown in bold lettering; on the John Street front the words "Offices of the Gas and Water Departments" are similarly inscribed; while the fronts to George Street and Cochrane Street each bear the legend, "Let Glasgow Flourish."

At a meeting of the Municipal Buildings Committee held on June 29, The Lord Provost submitted a letter, dated 15th inst., signed by Mr. Honeyman, president, and Mr. McLean, secretary, in name and by authority of the Council of the Glasgow Institute of Architects, suggesting that the several competitors in the preliminary competition should be invited by the Municipal Buildings Committee to return their designs for exhibition, and that all the designs should be publicly exhibited after the final award had been made. After fully considering the letter, the Committee were unanimously of opinion that it would not be expedient on the part of the Magistrates and Council to take any steps with a view to the exhibition suggested by the Council of the Institute.

**Monkstown, County Dublin.**—A tower and spire will be added to the church of St. Patrick. Portland stone will be used, as the Bath stone in the upper stage of the tower has decayed to such an extent as to necessitate the taking down of about 12 feet of masonry. The remainder of the spire will be of chiselled granite. The tower will be about 75 feet high, with two openings on each side, with polished granite columns, and carved and moulded arches. The spire will be 150 feet high, and will be surmounted by a wrought-iron cross. The cost will be about 1,600/. Mr. Long, of Kingstown, is the contractor, and the architect is Mr. J. L. Robinson, M.R.I.A.

## VENTILATION OF SEWERS.

A MEETING of the Yorkshire Associations of Medical Officers of Health was held in Doncaster on the 30th ult. under the presidency of Dr. North.

Mr. B. S. Brundell, C.E., read a paper on "Ventilation of Sewers." He said the question of the ventilation of sewers was by no means easy to treat in an interesting manner, and still more difficult was it to make the subject instructive, as so much had been already written and said on the subject. He would, however, endeavour to give a practical turn to the subject. It might be taken as clearly established that if the sewers of our towns were constructed with adequate self-cleansing "falls," and with proper flushing arrangements, and if at the outfall a free discharge of sewage could be secured at all times, there would not be much need for ventilation; for there would be no foul matter in the sewers out of which to create what was commonly called sewer gas. But, unfortunately, the great majority of towns were so situated that the sewers could only have gradients with small "falls," and too frequently the outfall was obliged to be either partly submerged, or, as in the case of pumping works, at certain periods inoperative, and hence sewage was stagnant for hours near the outfall, or moving so sluggishly that decomposition was set up, and sewer gas resulted. The question, therefore, arose how this could best be got rid of. The mode of ventilation of sewers which met with most favour was that of open gratings on the surface of the streets, and those had been found effective. In Leeds, and in some other towns, the gully gratings were now made to act as ventilators, the traps formerly used being removed. He had grave doubts as to the wisdom of leaving a place of escape close to a house or a shop door. Some openings emitted much more sewer gas than others; and it was therefore not only necessary to provide ventilation, but to ensure a current of fresh air. The openings consequently should not only be numerous, but well placed for the purpose—in fact, a constant interchange between the outer air and the sewers should be aimed at. Where there was a tendency for the gas to travel up the sewers, flap-valves should be placed so as to stop the upward current. No doubt much could be done by the owner of a house in the construction of such connections as would obviate the risk of sewer-gas finding its way into the house; but if the main sewers were properly ventilated the householders' precautions would not be nearly so necessary as they were at present. Another mode of ventilation which had been much advocated was that of exhaustion by connecting the sewers of a town with the furnaces of steam boilers; but this necessitated a peculiar construction of sewer, which would allow of the air being drawn from the sewers by the furnaces; and it was not clear what length of sewer could be so exhausted. Moreover, the furnaces of boilers were not always at hand. Still, no doubt, the principle was a good one, and he had tested it with success. The experience of Brighton was not very encouraging in this direction; and anything like the application of this principle of ventilation to the sewers of a town could not, he thought, be entertained. Ventilation by means of pipes carried up the chimneys of houses was sometimes adopted, terminating with an exhaust ventilator, and had been successful in some cases; but it should be carried out with great care, for in some places this system had been traced as the cause of blood poisoning. He would urge, as one conclusion to which he came, that main sewers should be systematically flushed; and the outfall of main sewers, as a rule, should have falling-doors, so as to prevent wind blowing up the sewers.

Mr. Masters read a paper on "The Circulation of Air in Sewers." Sewer-construction, he said, had been broadly distinguished by the terms "sewers of deposits" and "sewers of suspension." The former involved a system of flushing; in sewers of suspension a continual flow and circulation of air were provided. They were told on the best authority that sewers to be self-cleansing must have a certain grade, and he quoted from a table of inclinations, which gave the grade of a self-cleansing 15-inch drain at a fall of 1 in 250. He believed the most effectual means of creating a good current of air and ensuring the ventilation and thorough cleansing of the sewers was by a constant stream through the whole length of the sewers (instead of an occasional one), at a velocity of not less than 3 feet per second. It had been proved that the air would follow a stream travelling at 2 feet per second, in preference to rising to the highest point of the sewer. Any system of sewerage which provided for the removal of the sewage at so slow a rate that the sewer gas was left behind must be imperfect.

Dr. J. M. Wilson read a paper on "The Ventilation of House Drains." He said the house system of drainage should be provided with means of cutting off the waves of sewer air, or at least of giving them exit in a way harmless to the house inmates. He wished chiefly to elicit an opinion as to how far some principles of drain ventilation were satisfactorily answered by the requirements of the Local Government Board in their recent by-laws applicable to house drainage. That air from the house drains or sewers was in its effects injurious to health, and capable of originating definite forms of disease, they, as medical officers, had too many opportunities of confirming. These connections were as a

rule very defective. He proceeded to discuss the bye-law to which he referred. If, he said, it could be satisfactorily agreed that the plans proposed answered the theoretical requirements of the laws governing the action of gases, and—as their adoption was already being proved to be—more effectual than any previous practice in shutting off all air from the drains from entering the house, then he thought they might safely leave it to their engineering friends to smooth away any practical difficulties. To sanitary authorities and the public they could safely recommend a system which satisfied the principle of drain ventilation, and the adoption of which they might reasonably anticipate would rid us yet more of the class of diseases caused by what had been called aerial sewage.

The Chairman remarked that the question of the correctness of the germ theory underlay the discussion, and an important point to be considered was whether sewer-air was capable of carrying germs of disease.

Dr. Whitelegge, in referring to the first paper, remarked that if the ventilators to sewers were constructed sufficiently close to each other, it would be impossible for poisonous gas to accumulate in sufficient quantity to prove injurious.

Dr. Himes said that in the whole course of his experience he had never met with a case in which sewer-gas had produced specific disease. If it were true that sewer-gas did cause specific disease, medical officers would find themselves in the difficulty of having to condemn the present system of drainage in large towns. But where was the proof that sewer-gas was the cause of disease? A case of typhoid fever was found in a house, and an examination showed that the house was in direct communication with the main sewer. But so were thousands of houses in which there was no fever. In Sheffield there were acres upon acres without sewers of any kind, and so there were hundreds of villages, yet they did not find these districts any better off in respect of zymotic diseases. In his opinion it was matter for regret that sanitary authorities gave almost their entire attention to the causes of zymotic diseases, instead of endeavouring also to prevent, as they could in a great measure, that frightful scourge consumption, and probably also the large number of deaths from bronchitis and pneumonia, which were largely attributable to the same causes. But to return to the question of sewer-gas, in looking through the death-rate of his borough he did not find in those seasons in which the decomposition of sewer matter was most active that so many deaths from zymotic diseases were registered. In Croydon, where typhoid fever had been more or less prevalent, the bad smells found in many of the houses were assumed to be sufficient proof that sewer-gas was the cause of the fever. He did not think that was sufficient proof. His experience did not fortify the second-hand opinions which had been laid before the meeting relative to sewer-gas.

Dr. Wills suggested that water-spouts as conductors of sewer-gas were preferable, at least from an æsthetic point of view, to open shafts over which one had to walk.

Mr. Hodgson, C.E., remarked that it was a fundamental error to suppose that a certain amount of velocity in a sewer was all that was necessary to carry off sewer-gas. In connection with sewer ventilation, of whatever description, there must also be a system of cleansing.

Dr. Whitelegge urged these points for the acceptance of the meeting—namely, that sewer-gas did not mean merely a mixture of well-known chemical gases; that sewer-gas did not necessarily give off a bad smell; that it was not necessarily heavier or lighter than the surrounding air; and that it was deleterious.

The Chairman said he apprehended that sewer-gas was the sum total of all the vapours proceeding from the contents of sewers—nothing more nor less, in fact, than the results of decomposition, and varying at different seasons and in different temperatures, and in proportion to the contents of the sewer. In his judgment, a large amount of the most dangerous and pernicious gas was almost odourless. As the effect of its action, people were deprived of a great amount of the air they breathed. According to the teachings of the last fifteen or twenty years, all organic compounds in a stale condition were prone to excite other stale conditions in any organisms with which they came into contact, and the admission of these unstable compounds into our bodies was therefore, according to modern science, a fertile source of danger, and if they did not set up changes or actions in our bodies it was because we were in a condition to resist them. What was true of zymotic diseases was also true of noxious diseases arising from these causes. Then in these sewers we had the undoubted carriers of these noxious germs. By means of the connection between houses and sewers the infectious diseases of one house were carried to other families. And we had these diseases let into our houses in every possible way—by bath-rooms, by water-closets, and by other ways—and the only way of escape was by complete isolation from our neighbours. He frequently advised his friends to open out all dead ends of pipes and drains, so that there should be free and perfect exposure to the air. If we could have impervious floors and walls with, practically, open ditches for drains, we should best stave off disease; those who lived in villages would know quite well that the open ditch was far less offensive than a good many of our more expensively constructed sewers.

## THE IRISH BOARD OF WORKS.

THE fiftieth annual report of the Irish Board of Works has been issued. The loans authorised for all purposes during the year ended March 31, 1882, number 561, and amount to 841,954*l*. This aggregate of loan transactions is very much less than that for the two preceding years, which embraced transactions rendered necessary for the relief of distress during those years, the amounts in 1879-80 and 1880-81 having been respectively 988,359*l*. and 703,390*l*. The list contains seventeen loans for labourers' dwellings in towns, amounting to 33,674*l*., against 28,870*l*. in 1880-81; fifty loans were made for glebe-houses, against fifty-eight, covering a total appropriation of 18,506*l*., against 24,639*l*. in the former year. The total amount applied to those services now amounts to 300,540*l*. The Public Health loans, which last year from exceptional causes embraced seventy-two sanitary works estimated to cost 205,187*l*., provide in the present year for only these works at a cost of 132,683*l*.

Under the 19th section of the Land Law Act the duty devolves on the Board of making advances to tenants for the improvement of labourers' cottages on their holdings, or for the building of new cottages when directed by the Land Commission Court in fixing judicial rents to provide such accommodation, tenants so directed being deemed to be persons to whom loans may be made under the Landed Property Acts. No loan can be made for a less sum than 100*l*. Only three applications were received. The necessary inquiries, including the copy of the order of the Land Court and the publication of the notice of application, were at once proceeded with, but the time inevitably occupied in making these inquiries has not admitted up to the close of the financial year, ending March 31, of any of them being brought to that final stage in which the Treasury sanction would be applied for. Regarding these loans, if the course of proceedings which is required to be taken in respect of ordinary loans be strictly adhered to, the costs which, so far as they are preliminary in a deduction from the loans, would be altogether disproportionate to the small sums which as a rule they may be expected to amount to. With a view, therefore, to minimise the costs as much as possible, and thus to facilitate and at the same time expedite the granting of these loans, the Board sought and obtained sanction to the entries of inspection, and, when necessary, the preparation of plans and specifications being carried out by the inspectors appointed to conduct field operations under the 31st section, thereby admitting in several cases a considerable saving in cost and time.

## ELECTRIC RAILWAYS.

ON June 26 a lecture was delivered by Dr. Traill on "Electricity as a Motive Power," in the New Buildings Trinity College, Dublin. He said the application of electricity as a motive power to railways was now within the reach of practical engineering. Already a tramway, to be worked in this manner from Portrush to the Giant's Causeway, six miles in length, had been projected; and it was now approaching completion. The largest railway of the kind hitherto constructed was in Berlin, and was only two miles long. The electricity is generated at one end of the railway and is transmitted along the rails to machinery within the railway carriage which works the driving wheels. The lecturer gave a history of the various steps which had been made since the time of Faraday towards the perfection of the electrical apparatus necessary for this purpose, the greatest improvements having been made by Dr. Siemens, whose improvements had brought this application of electricity within the region of practical engineering. A powerful saw was made to cut wood by the application of electricity. In the case of a railway or tramway the current could be applied to any number of cars one placed after another. One great advantage of this motive power was that it got rid of the immense weight of the steam-engine and tender, and the consequent wear and tear that occurred to the rails. This could not be expected to be realised in the great arterial lines, on which the use of steam would have to be retained. At present the electrical motive power was chiefly applicable to small feeding lines, and these could be made cheaper than the others, because they would have less wear and tear to resist. Another advantage was that the greatest power was developed at the moment of starting. Inclines could be more easily ascended, because while the weight of the trains would be less, the electrical machines could be placed in every second carriage if necessary. Again, when the primary current was cut off, the inverse current would act as a brake. The occurrence of a curve, an incline, or any other obstacle, caused the machinery to develop extra motor force. No danger from the electric rails would occur to man or animals. In the course of his lecture Dr. Traill exhibited and explained a number of machines, and in conclusion said that now that steam-engines and windmills and small streams could be employed to store up electricity, possibly in time the pulsations of the great ocean itself might be employed for the same purpose, so that even the whirlings of the globe in space would have been harnessed to work the machinery of man.

Dr. Charles Siemens said he had been for more than thirty

years connected with electricity, and yet he had heard Dr. Traill with interest, and had enjoyed his lecture. Electricity had been made to span the earth as the transmitter of their messages, but it was not until very recent times that this agent, which seemed to possess swiftness without power, had been also made use of to transmit power itself in considerable quantities. The manner in which the power was accumulated was a simple matter of addition. Certain mechanical repetitions produced an accumulation like that of the drops of rain which produced rivers. Each individual current was like the drop falling from the skies, and these made a river of electricity for the required work. Dr. Traill had shown that he was conversant with the practical as well as the theoretical views of the subject. Would these railways be reliable? The Berlin railway, of which a photograph had been shown, had answered extremely well, but it had been put up only for experimental purposes. A line of 4 feet 8½ inches gauge had been made at Paris, but it had only been worked for a few months. During that time, however, it conveyed nearly a hundred thousand passengers, and never once failed. A question had occupied men's minds—namely, that of supposed danger from the rails. When the experimental line was first established at Berlin people tried whether there was any electrical discharge from the rails, and found that there was an influence which was productive of a very peculiar sensation; and the result was that after the car had passed hundreds of persons would throw themselves down on the line as if they were worshippers of the car of Juggernaut, in order to experience this pleasurable sensation. He (Dr. Siemens) was conducting a number of operations, such as pumping, chaff-cutting, &c., by the aid of electricity, on his farm at Tunbridge Wells. He trusted the time was not far distant when those whom he addressed would be able to satisfy themselves from actual experience as to the working of an electric railway.

## PUBLIC OFFICES, OVER DARWEN.

THE new Market House and Municipal Offices at Over Darwen were formally opened on June 21, by Mr. Grafton, M.P. for East Lancashire, in the unavoidable absence of Lord Hartington. The works have been in hand two years, and were the result of a competition for which Mr. Waterhouse was the assessor in 1879, when the first premiums for the Town Hall and Market House were gained by Mr. Charles Bell, F.R.I.B.A., of London, and by whom the market has been successfully carried out. The Town Hall is deferred for a time. The building is admitted by all to be excellently adapted to its twofold purpose, and a very creditable result alike to the architect and to the Corporation, who, in accepting the award of their adviser in the competition, have had no reason to regret it.

The market faces north and south, and consists of a central area 130 feet by 80 feet, covered with an iron roof in two semi-circular spans, and supported only by three columns. It is glazed on the north side by Rendle's system, and covered with zinc on the south side. On the north are six butchers' shops opening into the market, lined with glazed bricks, the floors being of wood blocks.

There are two main entrances to the market, north and south, enclosed by wrought-iron gates of elaborate designs. There are also two other entrances past the fish-stalls from the wholesale market. Those and the shops facing the square are enclosed by Salmon, Barnes & Co.'s wood shutters. There are also a row of shops facing the market square, having walnut fronts, and each with a cellar below reached by a circular iron staircase. The whole area of the market is cellared, and some difficulty was met with in their execution owing to the River Darwen passing from east to west across the site. It was, however, successfully and temporarily diverted, and solid retaining walls built, between which it now flows. The walls above being carried by iron girders, as is the whole of the market floor, with brick arches, and paved with Lowe's patent concrete.

There are convenient fish and game stalls on the west side, fitted up in a very complete manner, and outside there is a wholesale market open at each end to the Market Square, and to School Street, and glazed like the general market.

Above the south and east fronts are a spacious and well-arranged set of offices appropriated to the use of the Corporation, comprising council chamber (50 feet by 20 feet), mayor's parlour, committee-room, borough surveyor and gas and water engineer's offices, with lavatories, &c. On an upper floor are a number of spare rooms, part being used for the caretaker. Over the main entrance is a turret of teak and lead for a clock. The offices are reached by a separate entrance and staircase from the square, and those on the south front by a corridor supported on ornamental iron cantilevers, with hand-rail and iron panels from the market wall.

The whole of the exterior is of Darwen stone, designed in a simple but effective Italian style, to suit the material and surroundings. The interior is being faced with the Silkstone Brick Company's buff bricks. Carving is introduced in the spandrels of main entrance arch and in the coupled pilasters supporting main gable, in the tympanum of which are the town arms in bold relief, and in the panels of the centre window over entrance are the crests of the

mayors in whose terms of office the building was begun and completed—viz., Messrs. Aldermen Snape, J.P., and Green, J.P.—all executed by Mr. Gregg, of Darwen. The roofs are of green slate with red ridges. The ironwork of the basement was carried out by Messrs. Handyside, of Derby; the roofs by Messrs. Goddard & Massey, of Nottingham. All the grates in the offices are by Mr. Shorland, of Manchester. The general contractors were Messrs. Orrell & Son, of Darwen. Messrs. Haden & Co. supplied the zinc. Mr. A. D. Dawnay, M.I.C.E., acted as consulting engineer. The water-closets, lavatories, and the whole of the sanitary appliances were supplied and fixed by Mr. Stidder, of Southwark Bridge Road, London.

The total cost of the building has been 25,000*l.*, including the heavy and expensive foundations not originally contemplated. Mr. Hobson Haigh efficiently acted as clerk of the works.

### REGULATIONS OF THEATRES.

THE following are the regulations for the control of theatres which it is proposed to establish in Austria:—In every town where there is a theatre a local commission is to be appointed, composed of representatives of the municipal authorities, the police, the medical profession, the fire brigade, and impartial experts. These are to exercise a general supervision. Further, a similar local commission, but comprising members of the Diet, is to be attached to the Stadtholder's office in each province. All new theatres are to be detached from other buildings, and are to contain no store or painting rooms. Every inflammable substance used in the performances is to be impregnated with fire-resisting fluids; and the most minute precautions are to be taken for ensuring proper inspection. It will also be provided that there shall be an open gangway between every six rows of seats, that a shaft for the escape of smoke shall be erected, and that the number of the audience shall be strictly limited to the capacity of the theatre.

### THE SCOTTISH LAW OF UNCOMPLETED CONTRACTS.

A CASE of some importance to parties entering into contracts with tradesmen has been decided in the Debts Recovery Court, Glasgow, by Sheriff Balfour. Mr. David Forrester, ironmonger, West George Street, sued Mr. Walter Parlane, 25 Elmbank Crescent, for 20*l.*, being the price at which the pursuer agreed to furnish and lay a set of hall tiles in a new house at Somerset Place, belonging to the defender, which tiles were selected and fixed upon in the pursuer's shop after rejection of the first lot of tiles delivered to the defender. The defence was stated that the tiles first supplied by the pursuer were in great part defective, and that in lieu thereof the pursuer agreed to submit fresh patterns for approbation, but that no new agreement was come to with regard to the substituted tiles, and that on delivery of the second lot the defender was justified in rejecting them as unsatisfactory and cancelling the contract. The technical objection was further stated on behalf of the defender that the pursuer, in raising an action for the contract price of a job which had been only partially executed, had mistaken his remedy, and that he ought to have raised an action of damages in respect of defender's failure to fulfil his part of the contract by payment of the price agreed upon. The sheriff-substitute, after finding upon the facts that the weight of evidence is in favour of the pursuer's contention that defender, on April 5, 1882, fixed upon the pattern of tiles which were afterwards delivered to him, and that all still remaining to be done by the pursuer is the laying of the tiles, the floor having been made ready for their reception, and the tiles being in defender's house ready to be laid, grants decree for the full contract price and expenses, and repels the objection as to the form of action in the following terms:—"As to the second objection, the defender's agent maintained, in accordance with English law, that as this was a contract for the sale of goods not specific, but to be measured before delivery, the property had not passed, and the vendor's action was an action of damages, and he cited 'Benjamin on Sale' in proof of his proposition. It appears to me that English law is not applicable to the case, because if the criterion be the non-passing of the property, then in all cases in Scotland where goods are not delivered the seller is only entitled to bring an action for damages, because in Scotland, although you have a distinct specific subject sold, the property does not pass until delivery. The only circumstance which can give a colour to this being a different case from the ordinary case of specific goods, is that the pursuer has still to lay the tiles. The answer to that is that he has lifted the pavement, cut the doorstep and the concrete, delivered the tiles, and the simple operation of laying them is prevented by the defender's own act. On the merits of the case I am clearly of opinion that the pursuer, by the evidence of himself, his clerk, and workman, has established that on April 5 the defender chose the blue and white tiles, and was pleased with them."

Mr. Ewan Christian, diocesan architect, is preparing plans for the restoration of St. Leonard's Church, Bilston.

### BUILDING REGULATIONS IN PARIS.

THE Commission charged with the revision of the building regulations in the French capital has drawn up a project to take the place of the decrees of 1859 and 1872, by which the height and arrangements of houses in Paris are now regulated. This project, which has been favourably received by M. Watel, the reporter of the Municipal Council, will shortly be supplemented by another laying down the requisite interior sanitary arrangements.

Under the old rules the heights of houses were 11, 14, and for the widest thoroughfares 17½ metres. It is now proposed to alter these as follows:—

12 mètres in streets less than	7m. 80c. in width.
15 " " " from 7m. 80c. to 9m. 74c. "	
18 " " " " 9m. 74c. to 20m. "	
20 " " " " 20m. and upwards.	

The last class is, however, subject to the conditions—(1) that there shall not be more than five floors, *entresol* included, above the ground-floor, so that no part of the 20 metres may be used to make a sixth storey; (2) that each building shall have an interior courtyard of not less than 40 square metres area, the opposite sides of which shall in no case be nearer than 4½ metres, nor the angles between two contiguous sides to be less than 60 deg. This courtyard will not be obligatory in the case of buildings facing on several streets, and entirely filling up the space between said thoroughfares.

At first sight it would seem a change for the worse to allow the height of houses to be still further increased in Paris; but the alteration has really been made in the interest of the occupiers, for by Article 8 of the project it is laid down that no storey shall be constructed in any building whatever of a less height than 2 metres 60 centimètres, this measure, in the case of a floor or rooms built in the roof, being taken from the highest point. This is a good average; but, as a matter of fact, in most houses of 20 metres each storey will be at least 3 metres, the lower ones 4, and in some cases 5 metres. The new law will, once for all, put an end to the construction of more of those wretched *entresols* so common in the largest Paris houses, and in which it is impossible to raise one's arm without touching the ceiling, or have any furniture of decent size.

The system of aération is entirely changed under the new regulations. The passages, vestibules, and corridors must be well ventilated and lighted; while, as respects the interior courtyards and small courts, it is enacted—(1) that every court serving solely to light the kitchens must be of at least 8 metres surface, with not less than 2 metres distance between opposite sides, nor less than 60 degrees angle between contiguous ones; (2) that every court serving solely to give light and air to the water-closets must be of at least 4 metres surface, with not less than 1 metre 60 centimètres distance between opposite sides, nor less than 60 degrees angle between contiguous ones. Finally, every court that has no communication with the street must be ventilated from the bottom.

If adopted, these regulations will revolutionise the present mode of construction in Paris, and will prove an inestimable boon to occupiers of every class, and particularly the poor.

### THE LATE FRANCOIS GUIGON.

FRANCOIS GUIGON, a Swiss landscape-painter of some note, died early in June at Geneva, where, seventy-five years ago, he was born. Guigon belonged to the school of Genevan painters, which, under the influence of Rousseau, Horace Benedict, Saussure, and Toepffer, sought its inspiration in the history of the Helvetic Confederation and in the grand scenery of the Alps. While Lugardon told the heroic legends of primitive Switzerland, and Calaine and Diday transferred to canvas the wilder scenery of lofty peaks—glacier and snowstorm, whirling avalanche and föhn-swept forest—Guigon's genius led him to prefer the middle region. He liked best to depict the softer beauty of mountain pastures and the more tranquil landscapes of the lakes. The subjects of his best paintings are scenes about the lakes of Brienz and the Four Cantons. When his favourite domain was invaded by the crowd, and all the world took to painting Swiss lakes, Guigon sought his subjects on the other side of the Alps, in the plains of Italy, in the palaces and canals of Venice, and on the shores of the Adriatic. He laid down the brush only the day before he laid down his life, and, though he had rather outlived his reputation, his influence on Swiss art was considerable, and his blameless life and kindness greatly endeared him to his fellow-citizens.

**Reading.**—The foundation-stone of the new district church of St. Luke has been laid. The materials used in the construction will be local bricks, with picked red relieved with grey for outside facing. The dressings, &c., will be of Doulton stone. The church will seat about 600 worshippers, and will be warmed by hot and cold air flues, fitted up by the London Warming and Ventilating Company. Mr. John Bottrill, of Reading, is the contractor, and Mr. Robert Williams, clerk of Works. The architect is Mr. J. P. St. Aubyn, of the Temple.

### The Cyrene "Apollo."

SIR,—As regards such imputations as that I ignored what Mr. A. S. Murray had published on the subject of the Cyrene *Apollo*—people can only ignore what they are quite familiar with—and that I am even capable myself of making such an imputation on Dr. Waldstein, I should be a little ashamed of thinking it necessary to defend myself against them, and I leave them where I find them. My feeling towards those who never knew or forget what I have written on a common subject is one—not unusual I believe, or unamiable—of pure commiseration; weak, perhaps, but not wicked. In such cases—at least "with us of the right-hand file"—

Veniam petimus damusque vicissim.

I regret on several accounts that the observations of Mr. A. S. Murray—one especially—were not present to me when I wrote my article. I find that in his work dated 1880 he recognises the correspondence of the Cyrene head with that of the statue which he takes for granted as an *Apollo* without reasons assigned, and moreover, without reference to a difference of opinion on the subject on the part of Professor Boetticher, of Berlin, or any one else; neither in what is said of the style of the figure is there any recognition by Mr. A. S. Murray of the peculiar athletic development which caused the Dilettanti Society to publish it long ago as *The Athletic Apollo*, and not unnaturally induced Dr. Waldstein, quite independently of knowledge of their work, and Professor Boetticher also, to claim it as a mere 'iconic' statue of an Olympic victor. It is in this characteristic that a main significance of the statue resides, and, when this is left out of consideration, giving it the name of *Apollo* or any other name does not go for much. It may be my misfortune that a distinct protest of Mr. A. S. Murray against the chorus of applause that has greeted Dr. Waldstein's heresy has not reached me; but it was clearly time for some one to speak out with something more than a dogmatic opinion, for his views have just received further sanction and circulation by an unqualified approval embedded in the heavy but authoritative verbiage of Professor Overbeck's new edition of his "History of Greek Sculpture."

I am grateful for the reference by Mr. A. S. Murray to the note in which he mentions the agreement of the head of the statue and the Cyrene head with that on an archaic Cyrenian coin; it goes far to prove that *Apollo* was held in especial honour by the state under this particular type; shall I be too adventurous in following forth the indication? The statue has frequently been claimed as a copy of the *Apollo Alexicacus*—the Averter of Evil—the work of Calamis, a sculptor placed intermediately between Canachus and Myron. It was dedicated by the Athenians with this title in gratitude for relief from a pestilence by an oracle from Delphi. The identification would be nearly clenched if it could be established that the copy existing at Athens, which unluckily has lost its feet, did really stand on the *omphalos*, symbol of the Delphic oracle, which is associated with it—an association doubted, Mr. A. S. Murray thinks, and I presume from personal observation, without satisfactory reasons. What type, then, could the sculptor more appropriately adopt for the oracular Delphic god, as helpful and healthful, than his statue in his properly Delphic character as patron of athletic vigour—as *Apollo Puktes*, the pugilistic.

But now the sequel. When Pindar celebrates the chariot race victory which was gained at Delphi by the Cyrenian king Arcesilaus, he takes occasion to glorify *Apollo* as author of "remedies for the grievous maladies both of men and women," and describes the processions to his temple along a road of state to propitiate him as Averter of evils from mortals. The scholiast on the passage gives the precisely explanatory synonym—*Alexicacus*.

By the light of these combinations I could find in my heart to be indulgent to one who should be even positive that the athletic *Apollo* of the Museum represents the Evil-Averter of Calamis, whose expressive ideal of the god in this character was so celebrated as to cause it to be copied over and over again, and particularly for one of the principal temples at Cyrene, where he had honours under an equivalent title.

But alas! Dr. Waldstein declares a positive opinion, and supports it by engravings, that the legs of the Athenian statue are out of position to suit the imprint of soles of feet on the *omphalos*. Professional experts being thus hopelessly at odds, our theory swings in suspense, and we must await the report of a laic "of plain good sense, untutored in the schools," who has no theory at stake in the matter to influence his judgment or to oblige us prudentially to reserve our own.

Very truly yours,  
W. WATKISS LLOYD.

### Peterchurch.

SIR,—The valley of the Wye is not only one of the most beautiful districts in England, but it is replete with objects of archaeological and architectural interest. Some of your readers may have been in the interior of the church of Ross, and been struck by the unwonted appearance of a tree growing *within* the walls at the west end. Representations of this appear in the guide-books, and photographs of it are common. There is another freak of nature at Peterchurch which I have never seen reference made to. The Rev. C. M. Metcalfe does not appear to have alluded to it in the paper he read to the Woolhope Field Club, as reported in your paper of the 1st instant, yet it struck me as a very remarkable object.

When I was taking a view of the surroundings from a window of the comfortable little inn at Peterchurch, which is situated about 300 or 400 feet from the church, I was puzzled by the appearance of a large yew tree in the churchyard, the dark foliage of which seemed to carry a mass of white blossom. Upon closer inspection, it appeared that an alder tree was firmly rooted amongst the branches and was in full bloom. There must have been a considerable quantity of decayed vegetable matter accumulated at the junction of the branches of the tree with its trunk in order to support the alder bush in its unwonted position, for it was of considerable size and in full vigour. Flowering parasites, having their roots in the ground, are common; but I have never come across another instance like the present one.

I am, sir, your obedient servant,  
Edinburgh: July 4, 1882.

### REVIEWS.

THE OPEN FIREPLACE IN ALL AGES. By J. PICKERING PUTNAM, Architect. New Edition. Boston: Osgood & Co., London: Trübner & Co.

This book suggests how much may be made of any subject connected with building when it is treated by a competent authority. But architectural literature is deficient in books of its class. Although the open fireplace may be said to be an institution, it is only by means of a work like Mr. Putnam's, which is historical and scientific, that the importance of the subject and its relation to national life can be realised. A large number of illustrations are given, which represent some of the grand fireplaces in Belgium, and France, including those in the Council Chamber at Courtrai, the Salle de Mars, St. Germain en Laye, the Guard Chamber at Dijon, the house of Jaques Cœur, the Château de Coucy, and the Grand Hall at Poitiers. The principal systems for the improvement of the fireplace which have been devised from time to time in Europe and in America are described, and the author enters at great length into an arrangement which he has adopted in his own house. Several examples of the fireplaces designed by modern architects in America are given. Altogether the volume is a most valuable treatise on an important subject.

JAPANESE MARKS AND SEALS. By JAMES LORD BOWES. London and Manchester: Henry Sotheran & Co.

Mr. Bowes has in this volume given facsimiles of an immense number—probably a thousand—of the marks which have been used by the Japanese artists to distinguish their works. They refer to pottery, illuminated manuscripts and printed books, lacquer, enamels, metal, wood, and ivory carvings. It may be inferred from the title that the book corresponds with those which have been compiled for the guidance of purchasers of pottery, but the book is of a more important character. It enables us to understand something of the history of arts which have been hitherto obscure. The marks suggest that Japanese art is of "more modern growth than is generally supposed," and may be dated from the third Shogun—i.e. 1623 to 1649 A.D. In 1650 the manufacture of decorative faience began in Kioto, and, according to Mr. Bowes, "it is probable that the earliest examples of pottery of an artistic character other than Old Japan date from this time." Those who have imagined that Japanese art is of great antiquity will be surprised at this, and at another statement of Mr. Bowes, in which he says that "perhaps the most brilliant period of Japanese art was the last century and the earlier years of the present one."

One of the differences between Chinese and Japanese pottery is, that the former represents the work of many hands, while in Japan the advantages of individuality rather than of the division of labour are recognised. The name of the potter is therefore more often found on Japanese pieces, and generally it is painted. Mr. Bowes says that "impressed marks are very seldom found upon porcelain." Sometimes the age of the artist is given; in one example cited by Mr. Bowes the potter's age was sixty-two, in another seventy-two. When two men work together the fact is duly recorded. But the marks do not always consist of names. Inscriptions are written which are occasionally suggestive of those found on bells in Western Europe. "A desire for long life is often expressed, such as 'A thousand autumns'; 'To enjoy the longevity of the pine tree and the age of the stork.' Lines of poetry are also inscribed, which may refer to the subject represented by the artist. On the side of one vase are lines on a grove of

bamboos, which mean "When the wind rises the sound is pleasant! When the rain falls the colour is lovely."

The marks on the illuminated manuscripts and printed books are more matter-of-fact in character, and they generally refer to the name of the author, the number of the volume, or the subject of the work. One of the manuscripts described is a collection of paintings on silk of flowering shrubs, by Ki-No-Masa-tami, which were painted between 1804 and 1818. The preface is written on yellow silk, and is a superb example of calligraphy. It contains a most interesting exposition of the principles on which the artist worked, and indicates that the Japanese painters are aware of the difference between pictorial art and scientific representations. The following is a translation of the document:—

Those who paint flowering shrubs and rare grasses cannot do better than conceive the spirit of their natural power of growth. As to whether the branches should be bending downward or looking upward—whether the leaves should be thick or thin—whether the flowers should show their faces or backs—whether the colours should be deep or light—how can we attain perfection unless we study from the very objects? But we always find our power unequal to the task when we come to the flowers of some humble plants, whose daintiness and brilliancy dazzle our vision, and in which there is the sweet colour of life and growth. Indeed, they are beyond the sphere of the art, because there is no surrounding object by means of which we can impart life to the bare flowers. Therefore in this pursuit it is only necessary that we should do our best in preserving the shapes, the aspects, and peculiarities of the flowers, which we intend to produce. Whenever I see a flower or a grass, I never fail, in spite of my meagre ability in painting, to copy it out, so that it may serve the purpose of a model in the future. Indeed, those who are called botanists do not fail to paint plants, and their flowers and fruits, in the most minute way, and though they seem never to leave one single point untouched, yet they too often spoil the style of painting, and besides lose the fine spirit. Such is far from what I desire. In short, I know only to satisfy the extreme disposition of my own mind, and make this work the measure of my study.

It is surprising that works in lacquer are rarely marked, especially those which were produced for a patron, and among the old *cloisonné* enamels examined by Mr. Bowes only two bore the names of the makers. The bronze founders are also unrecorded, "nor do the makers of the exquisite modern bronze flower-vases and other objects follow the examples of the potters of their country in signing or otherwise marking their productions." The makers of swords and mirrors and the ivory-carvers are more desirous of recognition. Sticks of ink also bear the names of the makers. One described by Mr. Bowes is a sacred object, as it was made of the soot from the sacred fire in the temple of Kasuga.

The marks are most difficult to copy, but they have been reproduced in Mr. Bowes' volume with a freedom and vigour that are more suggestive of a manuscript than of pages printed in a type-press. Reproduction of this kind would have been impossible a few years ago. Mr. Bowes' volume is interesting by itself, and forms a worthy company to the "Ceramic Art of Japan," of which he was the joint author.

#### EXAMPLES OF IRON ROOFS. By THOMAS TIMMINS. Published by the Author.

The examples of roofs which have been prepared by Mr. Timmins are not to be confounded with the diagrams that are found in books on iron construction. The latter may be explanatory of a theory, but they are not adapted for immediate utilisation. Mr. Timmins does not concern himself with an investigation of the mechanics of roofs. He gives the results in a form which can be copied directly by the draughtsman, or adapted without difficulty. The spans selected are those which are most often treated in every-day practice, and range from 20 feet to 60 feet. With wider roofs there may be so many contingencies to be considered, it is not safe to prepare drawings without special investigations. Mr. Timmins' drawings show a recognition of other considerations besides those of stability and form. There is no excess of material in any of the parts, and the scantlings employed are those which are available in the market without incurring extra cost. As the dimensions of the details are figured and the weights are supplied, it is practicable by means of the examples to prepare a general design or working drawings for a roof, and to furnish an approximate estimate of cost with rapidity. Two sheets of graphic diagrams are supplied indicating the strains on the trusses under various loads, and these should be gone over carefully by the student, for it is unworthy of a professional man to employ a means which he does not understand. In fact it would be an advantage if Mr. Timmins' examples were taken as supplementary to books on construction, and as proving the relation between practice and theory. A table showing the strength of cast-iron columns is given, which extends to diameters of 16 inches and to lengths of 30 feet—in other words, it furnishes double the information of ordinary tables. The plates are clear and well fitted for application.

#### LECTURES ON THE SCIENCE AND ART OF SANITARY PLUMBING. By S. STEVEN'S HELLYER. Published by E. T. Batsford.

Mr. Hellyer has accomplished the difficult task of producing a book on a sanitary subject which is readable throughout. He appears to possess the qualifications of a popular lecturer, and

although the workmen to whom the course was addressed may have been familiar with much that was told to them, the subject was presented in so lively a manner that the oldest foreman could hardly be bored. Mr. Hellyer is a plain speaker, who does not mince matters, and it cannot be denied that there are too many defects in houses which allow opportunities for censure to a man of his class. Mr. Hellyer's book, which is full of suggestions and of information that is not commonly seen in print, deserves to be widely circulated among practical men. It has been published at a cheap rate.

### CHURCH BUILDINGS AND RESTORATION.

**Blackburn.**—The corner-stone of the new tower and façade of St. Alban's Church, Blackburn, was laid lately by the Bishop of Salford. The new portion is built of Yorkshire pier-points in broken courses, with ashlar dressings, and projects 34 feet 6 inches from the line of old front. The tower is placed in the centre of the façade, and serves as a central porch; it is 17 feet square, 64 feet high to square of roof, and 87 feet from the ground to the top of the cross. On the west of the tower is a porch, 16 feet 9 inches by 14 feet 3 inches, with entrance to church and a staircase leading to gallery floor. On the east side is a space of corresponding size, arranged with open benches. On the gallery floor is the choir, 21 feet 9 inches by 19 feet 6 inches, on the east side of which are open benches, and on the opposite one is the staircase landing. The total accommodation provides for 120 additional sittings. The design is Romanesque, with deep moulded strings and cornice table. The windows have shafts with moulded caps and bases, and are circular-headed, with hood-molds over. Angle pilasters are carried up to the square of tower, which is roofed over with slates, the apex being surmounted with a cross 8 feet high. The internal fittings are of pitch-pine, which will be stained and varnished. The floor will be laid with tiles, and the windows are to be glazed with cathedral tinted glass in patterns. The cost of the work amounts to 2,000*l.*, and has been let as follows:—Mason's work, Ramsbottom & Sons, Accrington; joiner's work, W. Cronshaw, Blackburn; slaters, Dyson & Son, Blackburn; plumber, J. Chadburn, Blackburn; plasterer, T. Murphy, Blackburn; painter, R. Duerden, Blackburn; carver, J. Gregg, Darwen. The architect is Mr. William S. Varley, F.R.I.B.A., 15 Richmond Terrace, Blackburn.

**Salford.**—A new Primitive Methodist chapel has been opened in Trafford Road, Salford. The cost of the building and of the schools attached has been 4,200*l.*, of which 2,700*l.* has already been raised. The former sum includes the purchase of the freehold. The new chapel is designed for 500 persons, and has been erected from the design of Mr. Fell, the contract having been entrusted to Mr. J. Gerrard, of Swinton.

**Liverpool.**—The foundation-stone has been laid of a new mission church in Earle Road. The style is Gothic. The church will accommodate 500 persons, and will be available for school purposes. The work is being carried out by Messrs. Nicholson & Ayre, of Wellington Road, Liverpool, as general contractors, under the superintendence of Mr. James N. Crofts, architect, of Harrington Street. Mr. Don is clerk of works.

**Burton.**—The church of Holy Trinity, Burton-on-Trent, has been opened. The edifice has been erected in place of an old one, from the plans of Mr. John Oldrid Scott, by Messrs. Horsman & Co., contractors, of Wolverhampton; the outlay, with purchase of land and other expenses, being about 21,000*l.* The building is of stone, with dressings of two varieties of Bath stone, relieved by red Alton stone, the walls faced with ashlar internally. On the exterior the red stone is used, with walling of Yorkshire parpoints. The hot-water apparatus is supplied by Messrs. Musgrave, of Belfast.

**Machynllyth.**—A new Wesleyan chapel, erected from the designs of Mr. Richard Davies, architect, Bangor, by Mr. Edward Edwards, builder, has been opened. The style of the building is Italian. The heating and ventilating has been specially cared for.

**Todmorden.**—A new Methodist chapel has been opened. The building is constructed of pitch-faced Yorkshire stone, with dressings of native stone. The fittings and woodwork are of pitch pine. The architect is Mr. Jesse Horsfall, of Todmorden, and the work has been carried out by local contractors.

### SCHOOL BUILDINGS.

**Kidderminster.**—New Baptist Sunday Schools have been opened at Kidderminster. The leading feature of the new school is the complete provision of classrooms. These run in two tiers round three sides of the quadrangle of the principal room, the upper set of classrooms having a gallery in front. Each classroom is walled off from its neighbour at the sides, but the glazed doors and partitions in front enable the whole of the classrooms to be commanded from the superintendent's desk. Complete privacy is secured for every class. The building has been erected by Mr. R. Thompson from the plans of Mr. G. Ingall, architect of Birmingham. The total cost is about 2,400*l.*

**Maryport.**—The foundation-stone of the new British School has been laid. The building throughout will be of red sandstone from the Netherhall quarries; the schoolroom will be 70 feet by 26 feet; and there will be three classrooms, each 22 feet 6 inches by 20 feet. Mr. Charles Eaglesfield, jun., of Maryport, is the architect. The following are the contractors for the different classes of work:—Messrs. McKenzie & Wilson, Maryport, mason-work; Mr. J. R. Banks, Maryport, joiner-work; Mr. Thomas Mandle, slating; Messrs. Hampson Bros., Wigton, plastering; Mr. Jonathan Gibson, Maryport, plumber's work; and Mr. J. Boyd, Cockermouth, painting and glazing.

### NEW BUILDINGS.

**The Shrewsbury Shirehall.**—The committee have received a report from Mr. Lockwood, showing the progress which has been made. The offices, with their fittings, have been completed and given up to the county, with the exception of the lower rooms and the communication with the courts and buildings in the rear, but the doorways leading thereto had been temporarily walled up, and would not be opened until the new buildings in course of erection behind were completed. The alterations to the premises to be used as new constabulary offices had been proceeded with as rapidly as possibly under the circumstances, but considerable delay had been occasioned by the unsatisfactory state of a portion of the main wall of the old County Court Offices, which had to be taken down and rebuilt. He anticipated, however, that the new premises might be ready for occupation in about six weeks' time. The works forming the foundation of the buildings in the rear of the courts had been proceeded with as quickly as the character of the ground would admit of, the close proximity of the old buildings behind rendering it necessary for the excavations to be carried out in small portions and with the greatest care, in order to prevent disturbance to the foundations of the adjoining premises. There had been no settlement or displacement of the old buildings owing to the great care and vigilance exercised by the clerk of the works and contractor's foreman, who had been very attentive to their duties in this particular. The work done throughout had been of a good and substantial character.

**Pontefract.**—The foundation-stone has been laid of a new vicarage-house in Mount Street, Tanshelf, Pontefract. The entire cost of the structure will be 2,100*l.*, exclusive of the site. The architect is Mr. Asahel P. Bell, of Manchester, and the builder Mr. Henry Gundell, of Pontefract.

**Tunstall.**—At a special meeting of the Tunstall Local Board, the Town Surveyor submitted plans for a conversion of part of the Market Hall into a new Town Hall and Public Offices, the cost of carrying out which was estimated at about 12,000*l.* Subsequently the Council approved of the plans submitted.

### ENGINEERING WORKS.

**The Forth Bridge.**—There has just been completed on the island of Inchgarvie, the spot where the central piers of the Forth Bridge structure are to rest, a wind gauge for the purpose of indicating the lateral pressure of the force of the wind from east to west. The erection is composed of an enormous mass of heavy timber—about fifty tons in all—which is placed upon the square tower and upwards of the old castle on the island. The top of the erection is about 100 feet above high-water level, and the apparatus upon which the wind exerts its force is a large flat screen of thick planks. This screen exposes to the wind about 200 square feet of a surface, and is mounted on small roller-wheels moving on iron rails parallel to each other. At each corner, and on both sides, are placed strong spiral springs resembling in some degree the buffer-springs of locomotives. On the east side of the screen are fixed steel wire conductors, by which the wind pressure is led to the indicator below. The apparatus is now in good working order, and the highest pressure registered since the erection is only one-fourth of the strain which the bridge is calculated to stand.

**Dover Harbour.**—The Bill which the Dover Harbour Board are endeavouring to obtain during the present session of Parliament for the construction of a deep-sea harbour at Dover is very comprehensive in its character, and practically aims at carrying out the scheme reported upon and approved by a Parliamentary committee some six years ago. The present Government pier, the Admiralty pier, will form the western arm of the harbour, and according to the plans it is proposed to lengthen this by extending it eastward for a distance of 550 feet. The eastward limit of the harbour will be formed by a pier or breakwater running out from under the cliffs beyond the Castle to a distance extending in a southward direction for about 1,000 feet, the space between the two piers being thus about a mile. Both these piers will converge slightly, and between them, marking off the entire limits of the harbour, will be a large breakwater. This breakwater will begin in the bed of the sea about 800 feet from the termination of the

eastern arm of the harbour, and extend in a southerly direction for about 1,200 feet, continuing in a south-westerly direction for about 2,100 feet to within 600 feet of the western arm. Provision is therefore made for two outlets of 600 and 800 feet respectively. The harbour will thus enclose nearly the whole of the bay which is sheltered by the cliffs, and is overlooked by the fortifications at the heights and the Castle.

### GENERAL.

**Mr. F. Holl, A.R.A.**, has accepted a commission to paint a portrait of Mr. Bright, which is to be presented by his constituents. A replica of it is to be placed in the Birmingham Art Gallery.

**Sir William Armstrong** has given 5,000*l.* towards the completion of two wings and corridors in connection with the new Natural History Museum at Newcastle; and Lady Armstrong has subscribed 1,000*l.* towards the general building fund.

**Mr. Jackson, Architect**, has been commissioned to design a new roof for the interesting old Moot Hall at Elstow.

**Mr. Robert Ferguson** has been elected to the professorship of Civil Engineering in Trinity College, Dublin, in succession to the late Mr. Samuel Downing.

**Mr. Cyril W. Herbert**, the youngest son of Mr. J. R. Herbert, R.A., died on the 2nd inst., of peritonitis, after an illness of a few days, at the age of thirty-four. He was curator of the Antique Room at the Royal Academy.

**Mr. E. C. Robins**, will deliver an address on "The Work of the Sanitary Institute of Great Britain" at the anniversary meeting of the Institute on Thursday next.

**Mr. George Eaton** has been appointed Borough Surveyor of Crewe.

**The Bideford Local Board** have elected Mr. Gent, builder, as Borough Surveyor.

**The London and Middlesex Archæological Society** propose visiting the ruins of the Roman city of Silchester on the 13th inst.

**The Annual Congress** of the Cambrian Archæological Society is to be opened at Llanrwst on Monday, the 31st inst. Among the objects to be visited are the inscribed stones at Pentrevoelas, Penmachno, and Guytherin; effigies and brasses at Bettws-y-coed, Ysptyt Evan, and Llanrwst Church. The opening of a tumulus at Llangerniew will also take place.

**The National Gallery** of Scotland has a fund which amounts to about 42,000*l.*, and which can be applied by the Trustees to the purchase of objects calculated to aid education in the Fine Arts.

**A Marble Statue** of the late Charles Darwin will (if the Trustees approve) be placed in the large hall of the Natural History Museum at South Kensington.

**The Dublin Corporation** have elected Mr. D. T. Walsh and Mr. W. Butler to be building surveyors under the Public Health Act. There were ten candidates. Notice was, however, given by one of the aldermen that he should oppose the confirmation of the appointment on the ground that the bye-laws had not been complied with in the election.

**A New High Altar** was on Sunday last consecrated at Cleland, Lanarkshire, by Archbishop Eyre. The sculptor is Mr. O'Neill, of Dublin, and the cost was raised by the Irish inhabitants of the district.

**The Prizes** in the competition for the new building for the German Parliament have been awarded to M. Wallot, of Frankfurt, and Thiersch, of Munich. They win 750*l.* each. Three prizes of 500*l.* each were won by Berlin architects. There were over 150 competitors.

**The Plans of Messrs. Littlewood & Capon**, of Bedford Square, London, have been adopted for the erection of chapel, lych-gate, mortuary, and necessary outbuildings, at the new cemetery, Leighton Buzzard.

**The Tunstall Local Board** have finally adopted designs for new public offices as prepared by Mr. A. R. Wood, architect, of Tunstall. The work comprises offices, court-room, board-room, and a rearrangement of the covered market, at an estimated cost of 12,000*l.*

**The Metropolitan Board of Works** are prepared to receive on the 11th inst., at the Bank of England, sealed tenders for 1,650,000*l.* of Three per Cent. Metropolitan Consolidated Stock. The money is required for street improvements, artisans' dwellings, main-drainage extensions, Fire Brigade stations and plant, and other new works; also for loans to the School Board for London, the managers of the Metropolitan Asylums District, and Boards of Guardians in the metropolis.

# The Architect.

## THE RESULT OF THE GLASGOW COMPETITION.

**D**ROVOKING as competitions always are to perhaps ninety-nine out of a hundred, and good reason as there may be for the provocation, there is one act of generosity in which every one may combine at last with satisfaction, namely, in congratulating the winner, and this especially when the prize is a good one. The great contest for the Glasgow Municipal Buildings has resulted in the selection of Mr. WILLIAM YOUNG, of London, an architect already well known by means of several exceedingly clever country and London mansions built from his designs, which have from time to time appeared amongst the illustrations of the professional journals; and assuming as we may do that the work now so successful is of equal merit with that which he has done before, we have no hesitation in inviting our readers to congratulate Mr. YOUNG most cordially upon his victory.

One particularly good reason for this, as all patriotic persons must agree, is the happy circumstance that Mr. YOUNG is a Scotchman; nay, there is even a better reason still, for he is a Glasgow man; and if the Glasgow architects—not one of whom, we believe, was fortunate enough to win a place amongst Mr. BARRY and Mr. CARRICK's selected ten—can see their way to take the matter patriotically, by claiming Mr. YOUNG for a fellow-townsmen and resolving to rally round him in that character, we venture to think it would be both good taste and good policy. All the world over blood is thicker than water, and with Scottish blood we have always been accustomed to think this is so more than ordinarily.

Until we are permitted to see Mr. YOUNG's design it is impossible to form any adequate opinion of its merits, and it is unnecessary to add that the report of a local newspaper such as we reproduced last week, however fluent it may be, is of no more service to the architect than to any one else in the description of what seems to be a somewhat intricate composition; but we observe in the printed particulars attached to the design at least two things which will be deemed worthy of the heartfelt approbation of all persons experienced in the art and science of winning an architectural competition, showing that SAM SLICK's "soft sawder and human natur" are still delightfully to the fore as much as ever. In the first place, the author is exceedingly careful to point out that he has adhered as closely as possible to the disposition of Mr. CARRICK's approximate plans; in the second place, he with equal care conveys the information that he himself is Glasgow-bred. He "has considered it best to adhere" to Mr. CARRICK's plan because of the "great amount of study" which the Town Surveyor has evidently bestowed upon it; and [if any cynical competitor should still be of opinion, as many are, that the plan was a remarkably crude and unpolished production, our answer shall be that the ingenuity must be all the greater which has succeeded in licking such a specimen anyhow into passable shape. Again, in the matter of the "elevations," when the designer's great object is explained to have been the production of something that should be not only "worthy of the second city in the Empire," but inspired by reminiscences of his own "early studies in Glasgow," if adepts in competitioneering should allow themselves perhaps to smile, we prefer to wait, in the expectation that, like Mr. YOUNG's plan, his artistic design also will prove to be all the more meritorious for the self-denial which has been involved in the recognition of Glasgow as the headquarters of modern classicism. There are spots, however, even in the sun; and if Mr. YOUNG had assumed a more independent attitude he might have only lost his chance for his pains. Some of our readers may remember the great competition for barracks which took place about twenty years ago, when all the world architectural were earnestly invited to improve to the utmost upon the old arrangements of the Royal Engineers. How was the competition won? Of the two first premiated plans, one was, as nearly as the designer dared, an exact reproduction of

the same old story; while in the other the reproduction was actually carried even farther, as far as the conservation, for instance, without a blush, of that most primitive of all "sanitary appliances" which decency forbids us to describe further than by the name of "the tub." If competitors are to be denied such harmless cajolery, then human nature must change indeed. The only architect of eminence just now who professes to have won his way to fame by means of competition absolutely devoid of all manifestation of frailty, our very estimable friend, Mr. EWAN CHRISTIAN, may, for what we know, pull a face at these artifices; but all we can say is that, if there were even a good deal more of such finesse than we consider to be likely, we are still prepared, as the world goes, to support Mr. YOUNG, and to join him heartily in what seems to be the culmination of his strategy, which he thus uncompromisingly describes:—"The group over the apex of the (principal) pediment represents TRUTH, as the guardian angel of Glasgow, accompanied by RICHES and HONOUR, presenting the city with its motto, LET GLASGOW FLOURISH!" It is clear, at any rate, that Mr. YOUNG has not had the privilege of being a shareholder in a certain Bank.

Truly grand architectural art, it will be said, stands proudly independent of all such rhetorical byplay; but it does not follow that the presence of such pleasantries indicates any artistic sacrifice, and we will say at once that we do not suppose Mr. BARRY has been in the slightest degree influenced by anything apart from a conscientious estimation of the architectural work pure and simple. The result which has at length been arrived at will be regarded by him, no doubt, as a great triumph. A sanguine correspondent of our own, a few weeks ago, pronounced him to be the hope of the profession, or the safeguard of its prosperity, or whatever else the phrase might have been, meaning that he was the great Protector of Competition; and we certainly must offer him our felicitations upon the success of his system in the present leading case. Not only does it seem to be the fact here—as it most frequently is—that one design stands out prominently before all the rest, but when the anonymous author turns out to be a man who has already made his mark, one who is also a Scotchman by birth, and one who is indeed a Glasgow man by education, it must be admitted that better fortune could not possibly have befallen, and many will say the probability now is that nothing more will be wanted to establish for the next twenty years the double competition scheme, with its professional adjudication, as a fixed institution throughout Great Britain, perhaps America, possibly France and Germany. The bugbear of the system—the idea of the "insuperable obstacle" to the acceptance of a first prizeman after his name is disclosed—which, it will be remembered, Mr. BARRY a few weeks ago pronounced to have been virtually surrendered beforehand by his clients at Glasgow—has been proved to all appearance to be but a form. The theory now to be adopted will be that the chances of success on the part of ineligible competitors are always very small, and that the first place, at least in any contest of a high class, is sure to be taken by a high-class man. Instances to the contrary (which may come up very shortly) will probably be ignored as accidents, or taken as exceptions which prove the rule. And as it is certainly correct to say that the higher the order of merit involved, the more likely it is that able and experienced architects may be induced to enter the lists, so also, it may be, the greater the difficulty of the problem, the greater will be the probability that the very best solution can only be the work of one of the ablest and most experienced of all.

But let this not be overlooked: a result of such a kind is by no means the same thing that the advocates of public competition *à outrance* are contending for. What they want to bring about is the success, not of the known and established man, but of the unestablished and unknown. Their grand ideal of a competition is a contest that brings to the very front of the profession, at one romantic leap, some "young man" (the very phraseology is stereotyped in their arguments) "who otherwise would have no hope of getting on." Let it not be forgotten that this is not the result of the Glasgow contest, and that, if it had been, the "insuperable obstacle" would to a certainty loom up with all its horrors.

This "insuperable obstacle," by the way, is no new thing; even as the double competition itself, and the professional adjudication, are no new things. Indeed there can be nothing new in this process anywhere until the reservation of a right to supersede a first prizeman shall be definitely sur-

rendered. Such an act of self-protection at the discretion of the promoters has been the most prominent of all incidents connected with architectural competitions from time immemorial. Indeed there have been comparatively few first prizemen during the last fifty years who have not been set aside; in other words, it is the chief practical grievance amongst professed competition-men that when they have fairly won they are not fairly entrusted with the work. Their design is delighted in as supremely perfect up to the moment of opening the sealed envelope; half an hour afterwards it is complacently overturned, and one which was pronounced "infinitely inferior" to it is preferred for execution because its author is a known man!

It is probable that we shall have more to say upon the result of the Glasgow competition. Dissatisfaction must be expected, and controversy not a little. There is only one circumstance which we need allude to in this connection at present. We are informed that the architects of Glasgow are annoyed at the "secrecy" which has characterised the transaction throughout and is still maintained. They have requested the Town Council to authorise an exhibition of all the designs, and this has been refused. It has been pretty well determined that an exhibition shall nevertheless be held. We cannot but regret that there should be any controversy on this point. Considering that what we may safely call a good many thousand pounds has unquestionably been expended in hard cash by the architects of England and Scotland in the preparation of designs for the choice of the Town Council and their advisers, it may certainly be thought hard that "secrecy" should be so greatly relied upon. Much may no doubt be said on both sides of the question, but after all this fact remains—that secrecy is a thing which is nowadays discountenanced amongst us in all public business on principle, and that unlimited publicity is deemed the safeguard of all justice. If Mr. YOUNG's design is as supremely good as it is declared to be by the LORD PROVOST, why object to an exhibition? If we may say one word more, it shall be this:—If, as Mr. BARRY and Mr. CARRICK report, the sketch "Viola" was as conspicuously the best as the finished design, why should the second competition be necessary?

#### THE CHURCHES OF CHARENTE.\*

WE have already described the circumstances to which the publication of the memorial volume on the domed churches of Charente is owing, and we now propose to notice the buildings which are illustrated on the pages. Thirty years ago Professor DONALDSON read a paper on Gallo-Byzantine churches in France, in which he said that in the central provinces there were buildings distinguished from others belonging to Christians by the use made of the cupola, that they were without root in the country, isolated in the national taste, and appeared to reveal clearly and incontestibly an Eastern origin. In those days people were accustomed to draw a hard-and-fast and very definite line between architectural styles and periods, as if there were a certain number of absolutely new creations in the art of the builder. But since then more has become known about the relations between architectural forms, and it would now be hazardous to assert that a type of building which seems to be unique is isolated or rootless. The inventive powers of men are limited, and inquiry generally shows that originality is but another word for adaptability. The so-called Gallo-Byzantine churches, instead of being isolated, might rather be said to be connected with Roman buildings on the one hand, and with Gothic buildings on the other.

It is not uncommon for geologists to dispute about the formations under which the rocks of a district are to be included where there is overlapping, and in consequence geological maps are always undergoing transformation. The peculiarities which give character to the beds can be interpreted in more ways than one, and therefore it is impossible to arrive at certainty. The Charente churches can in the same way be claimed as having affinity to different styles. They have many features in common with buildings that are said to be Roman and Classic. The round arches, domes, mouldings,

the massiveness of the masonry, the indifference to ornamentation in the interiors, and the attention given to symmetry, are suggestive of Rome, however debased may be the details. It would be quite fair to include the churches in any history of Classic architecture which professed to be exhaustive, and did not exempt the corruptions of the style. With no less probability they might be claimed by the historian of Gothic art. Many things which are accepted as being essentially Gothic are represented in them. The use of the pointed arch would by itself be sufficient with some to constitute them Gothic. The richness of ornamentation on several west fronts, and the capacious portals with their numerous orders, can only find counterparts in mediæval churches. The arcading is Gothic, and so is most of the ornament. This diversity of character gives so much fascination to the buildings that it is surprising they have not hitherto secured more attention from investigators.

As happens elsewhere, the history of the buildings is in a great measure a blank. It is believed that in the ancient province of Angoumois, which is now the department of Charente, during the twelfth century there was (to use the Archbishop of YORK's phrase) "a paroxysm of building churches." Many of them have survived, and they are interesting whether they are considered one by one or in groups. There is a strong family likeness between them. If we study the typical plans which are shown in the volume we find that the churches were generally cruciform, but without aisles. Out of eleven examples, one (Cellefrouin) has aisles, and another (St. Michel d'Etraigues) is an octagon on plan. Sometimes the nave is covered with barrel vaulting, sometimes with three or four low domes—one being at the crossing of the nave and transepts. The builders were no more inspired by the true Gothic spirit than was Sir CHRISTOPHER WREN, for the domes are masked on the outside by structures of a different kind. Preference was given to a sort of spire in which the courses are made of stones which are cut in the form of scales, so that the whole resembles a fir-cone or pine-apple. Even more than the domes those spires might be taken as revealing an Eastern origin. The west fronts are also peculiar, and on them the twelfth-century sculptors were allowed to exercise their skill. There are three vertical divisions which are sometimes divided by shafts running through three or more storeys. The central division on the lower storey is the doorway, and the other arched divisions are introduced for the sake of symmetry. It is supposed that the west front marked the completion of the work, and became the memorial of the founder. On several of them representations, more or less imperfect, are found of a man on horseback, with another man lying on the ground. This has been interpreted as symbolising the relations between the *seigneur* and his serfs. In the period between the fifth and tenth centuries the feudal lord was possessed of great power, but servitude was accepted as a matter of course, and it was hardly requisite to suggest the consequences of rebellion to the church-goers. In the twelfth century, when the Charente churches were erected, there was an approach to freedom, and the villein was not then (if he ever were) in the condition of a prostrate animal that might be trampled upon with impunity.

To most people the interest of the Charente churches would be found in the construction of the domes. Many examples are given in the plates. The domes appear to have been used mainly for convenience, as by means of them the thrust was extended to four walls instead of two, as in the case of barrel-vaulting. On this subject, an extract from the lecture will suggest the character of the descriptions which accompany the illustrations in the Memorial volume:—

It is easy to make an accurate comparison of the pressures exerted by the domed vaults derived from the east with the pressures in the other forms referred to by M. VERNEILH, if we confine ourselves to the simplest forms of each—namely, the cases (1) of the barrel vault; (2) of the domical vault in which the pendentives and dome are parts of one and the same sphere, of which there are instances, as at Fléac; and (3) the quadripartite Romanesque vault, with semicircular cross springers; and on the assumption that in the three cases the compartments are square and equal to each other and ribless. It admits of easy geometrical proof that the surfaces in the case of the barrel and domical vaults would be exactly equal. But though the vertical weight (assuming identity in thickness and material) would therefore be the same in each case, the lateral thrust is very different. The horizontal pressure of the barrel vault pushes directly against the side walls, however much they may be weakened by arches or windows: the domical vault presses outwards in the direction of the diagonals of the square, and part is therefore counteracted by the thrust of the contiguous compartments or by the end walls, and the remainder

\* A Visit to the Domed Churches of Charente, France, by the Architectural Association. London, in the year 1875. Published as a memorial of Edward Sharpe. With an historical and descriptive text, illustrated by sixty photo-lithographed plates.

admits of being provided for by special buttresses or piers. Moreover, the centre of gravity is at a greater height above the springing, and the pressure is therefore in itself more vertical. The egg-shaped figure of the dome is also much stiffer than that of the barrel vault, more self-coherent, and may therefore be built of much thinner masonry. If compared with the compartment covered with the quadripartite vault, the domical surface would be the heaviest in the proportion of 3'1416 to 2'2832, or about 11 to 8, but the advantage of the higher centre of gravity and of the egg-shaped stiffness of figure would still remain in favour of the domical surface. When the dome, as in the majority of instances in France, is formed of a smaller sphere than that which belongs to the pendentives, the surface is a little in excess of the barrel, but the other advantages are not in the least delivered.

The soffites of the domes are dressed plain, for in no case do we find coffers, or other attempts at variety of surface. The exterior was commonly left rough, but in one instance (Trois Palis) "the tops of the domes externally are worked to an even face, as though they had been intended to be seen externally." It was the rule to make the domes circular on plan, but at Mouthiers one is found slightly elliptical, and at Cellefrouin the plan appears to be an octagon. The church of St. Amand de Boixe has many interesting features. It is the only example of a dome with ribs. While in "most of the domes derived from Périgueux the cornice band which terminates the pendentives and starts the dome rests upon the extrados of the arches of the crossing," at St. Amand de Boixe "the pendentives are carried up about three courses unbroken. Then there is a drum with a continuous arcade all round of twelve arches, which are pierced for windows."

The Charente domes cannot be considered to be remarkable examples of scientific construction, but they answered the purposes intended by the builders, and, unlike many kinds of roofs, have survived for twelve centuries. The mason's difficulties were mostly in working the pendentives, and in some of the churches the contours appear to have been "fudged" in order to effect a slightly junction between the arches and the domes. Pointed arches are used sometimes for the sake of convenience, and the builders do not appear to have been aware that there was any incongruity in the coexistence of pointed and semicircular arches in the same building. We have said that aisles are uncommon in Charente. There is one interesting example at Cellefrouin, where the crown of the vaults in the aisles is at the same level with the vault of the nave. To accomplish this the springing in the aisles is at a much higher level. It is remarkable that, although the builders were able to construct vaults and arches with readiness, no niches or recesses for images are to be found in the churches. The sculpture on the exterior seems to be attached to the building, as there is so little provision for it. At Trois Palis the figure of CHRIST and the evangelistic beasts are found within square recesses, which may have been formed by the men who constructed the magnificent porch of Chalais.

The ornamentation of the churches is conventional, but it is not so pleasing as the work of a later time. The Charente carvers might never have seen a flower growing or a live animal; everything is twisted regardless of natural proportions, or probability. The most elaborate example of the style is to be seen at St. Amand de Boixe.

Among the plates which illustrate the memorial volume are many which are as good as can be desired. The geometrical drawings, the details of ornament, and the sketches of the west fronts are most creditable to the authors. Some of the interior perspectives want vigour, but taken as a whole the Association may feel proud of the work of its representatives. The volume has been printed and bound in a manner that is rarely surpassed.

## ROYAL ACADEMY ARCHITECTURAL SCHOOL.

THE following students have been admitted to the Architectural School:—T. J. Dalziel, J. C. Hambling, C. E. Holmes, C. P. Leach, H. W. K. Martin, E. W. Smith, E. A. Woodrow. *Lower School*—J. H. Ball, D. W. Bellhouse, W. D. Caröl, B.A., H. O. Cresswell, W. J. Gargery, F. Johnson, F. L. Lee, E. S. Norton, P. J. Popplewell, J. G. Sankey, H. A. Satchell, W. C. Rea, F. H. Tulloch, A. F. Vigers, G. G. Wallace, G. W. Ward, W. H. Woodroffe, E. Woodthorpe, B.A. *Probationers*—F. S. Capon, E. Crisp, C. D. Fitzroy, A. Forrester, W. J. Gibbon, J. J. Muller, F. P. Oakley, S. B. Russell, J. E. Sears, J. Thomson, W. R. A. G. Tucker, W. F. Young.

## THE ART OF THE BLACKSMITH.\*

By G. H. BIRCH, A.R.I.B.A.

(Continued from page 20.)

THE next era during which the smith's art seems to have arrived at a culminating point is the thirteenth century. We have an immense number of examples, nor have we to go far to find them—they are as well represented in England as on the Continent. The idea is much the same as in the preceding century, only the scrolls are easier in their curves, the foliations more general, and the woodwork almost entirely covered. In the cloisters of St. George's Chapel, Windsor, is a nearly perfect example: the door occurs in Henry III.'s work, some very beautiful wall arcading still remaining in juxtaposition. The door itself is of more recent date, probably Edward IV.'s time, but the iron-work has belonged to an earlier door. It can scarcely be called a hinge, it is more correctly a covering of metal-work, and although mutilated in parts, the design is exceedingly beautiful. Each leaf of the door has three pointed ovals, known technically as the "vesica" shape; these are intersected in the centre perpendicularly by a bar of iron, and from this and the vesicæ spring very beautiful curves, filling up the whole interstices. The sides and arched top have an outer containing line of iron, from which spring little buds of foliage at intervals; the lower vesicæ are now imperfect, having one-third cut off, and the top containing line on the left is wanting. Between the first and second panels are two pierced circular discs with rings for handles, seemingly of later date; the intersecting bar is not continuous, but terminates, close to the point of each oval, with an embossed rosette, thickly studded with small nails to attach it to the wood-work, and with heads, bosses, and leaves at intervals. At York Minster there are splendid specimens of metal-work on two cope chests; these chests are of the shape of a quadrant of a circle, so as to obviate folding the cope, often stiff with gold embroidery. The lids open in the centre more than once, and the hinges with their scrolls cover the whole surface; the design and execution of the work being similar to the previous example. At Chester Cathedral there is an upright vestment press in the sacristy, opening in three divisions and one subdivision; but in this case, as at Windsor, the ironwork is more as a protection than as a hinge, for the hinges are separate, being only small straps of metal and not connected with the scrolls. The design is irregular, the centre division having a perpendicular line from which spring five scrolls on each side, with floriated ends; the left-hand division has one bold scroll in three curves, and the right-hand division opens in two subdivisions, each having a horizontal bar in the centre, with scrolls springing from each side, but reversed, the lower being the boldest; the centre and right have containing lines on each side, but none at the top or bottom. This example at Chester Cathedral is a very beautiful one, and not so much known as it should be, or as it deserves. At Ripon Cathedral there is also another vestment press, but the hinges are plain strap hinges with a stiff conventional series of curves on each side, more curious perhaps than beautiful. The handle is a simple circular disc with punched holes round the outer circumference, and a drop ring handle. Ripon Cathedral possesses also some very good hinges on the south door of the choir, which may be twelfth century, but if not, are certainly thirteenth century, and they have no back straps.

Eaton Bray Church presents, on the south door, a very fine specimen of early metal-work. Here the door is again covered with the scrolls diverging from three strap hinges reaching quite across the door, the apex of the arched head being also filled with scroll-work; portions of the bands are also ornamented with engraved work; the leaves and rosettes are punched. The ring and plate are perfect. This specimen is in a very good state of preservation, only some of the scrolls at the bottom being imperfect. In the same church is another hinge of more simple character, but of a very quaint design, and possessing the peculiarity of being alike on both the inner and outer sides of the door. In the Cathedral Close at Norwich there are the remains of a beautiful specimen of iron-work covering one of the doors, but it is in a sadly mutilated condition, the upper hinge being the only one perfect; this has an outer iron band following the outline of the door, though only one portion remains, and between the two hinges is a horizontal bar starting from a central raised boss from which hangs the handle; the ends of the bar being floriated.

The examples enumerated here are only a few amongst many, a detailed description becoming monotonous, for they all more or less follow one general arrangement. The French examples differ slightly in treatment, but there the strap is rather broader and does not branch out into scrolls until it reaches more than half across the door: the scrolls are shorter and the foliage richer than in the English examples, and the scrolls do not bear the same proportion to the strap. A very good hinge is still to be seen on the north door of Rouen Cathedral, Portes de Calendriers, and at Noyon Cathedral on the door of the staircase leading to the treasury. But hinges were not the only things upon which the smith of the Middle Ages

\* A paper read at the special visit of the Architectural Association to Messrs. Gardner's, West Strand.

exerted his skill and ingenuity. The grilles which protected the tombs in the interior of churches and the openings in screens demanded alike the exercise of both, and at Westminster Abbey there is still preserved and replaced *in situ*, after having been for many years thrown by on one side amongst useless lumber, a specimen which any age or any clime might justly be proud of. Around the shrine of Edward the Confessor repose many of his successors, and this chapel and shrine was exceedingly rich in costly gifts, silver, gold, and jewels being there in great abundance. Originally the only entrance to the chapel was through the doors in the screen forming the reredos of the high altar, and though considerably elevated above the level of the pavement of the surrounding aisle, it was not sufficiently secure to protect its precious contents, and there must have been some screen or railing. At the close of the thirteenth century the only royal tombs besides that of the royal founder, Henry III., was that of his daughter-in-law, Eleanor of Castille. Henry's tomb was of a good height, but Eleanor's was not so lofty, and there was the dread of robbers making free with the offerings to the shrine, as they had done only a short time previously with the treasure which the king had amassed for his Scotch wars, and which was stolen from the treasury in the cloisters hard by. A grille of very beautiful workmanship was accordingly placed on the north side of the tomb towards the aisle, the top of the grille being finished with a formidable row of spikes, or "cheveux de frise," as we now term them, completely guarding the chapel on that side. The framework of forged bars projects from the tomb in a curve, and on the front of these bars is riveted some exquisite scroll-work. It is difficult to describe in detail this art treasure—a photograph only could do it justice; the wonderful energy and beauty and infinite variety thrown into the little heads of animals which hold the transverse bars in their mouths, and the beauty of the leaves and rosettes, scarcely two of which are alike, are things which must be seen to be appreciated. On the score of anything very beautiful attributed to foreigners, this ironwork, like the beautiful effigy of the queen whose tomb it guards, has been attributed to French or Italian influence; and the English Torell, who moulded and cast the bronze effigy, has been Italianised into Torelli, a name which he never bore in his lifetime. With regard to its being French, France has now nothing existing resembling it in the slightest degree; while the work in the cloister at St. George's Chapel, Windsor, before referred to, does resemble it slightly in some points.

A very beautiful grille exists at Canterbury Cathedral, screening St. Anselm's Chapel from the south aisle and the tomb of Archbishop Meopham. This grille does remind one of Italian or foreign work, but there is every reason to believe it to be English; its great characteristic is its extreme lightness, for it is formed of a series of double scrolls only  $\frac{1}{2}$  inch wide by  $\frac{1}{2}$  inch in thickness,  $7\frac{1}{2}$  inches high and  $3\frac{3}{4}$  inches broad, placed back to back and fastened together and to the contiguous scrolls by small fillets or ribands of iron wound round; these being fixed into iron frames 6 feet 6 inches high by about 2 feet 10 inches broad. This extreme lightness makes it resemble the foreign examples.

Reverting again to a hinge, omission has been made of a very beautiful one now on the door of the hall of Merton College, Oxford, the *motif* of which is certainly earlier than the possible foundation of the college by Walter de Merton, and even earlier than his first foundation at Maldon, which he afterwards moved to Oxford. He was the earliest real founder of a college in that classic city, for Alfred the Great and his supposed foundation of University College must be considered as a myth. This hinge is remarkable for its bold and vigorous treatment, its leading lines and curves being very pronounced, with the scrolls and foliage kept subordinate. The handle is modern, the two ends next the ring terminating in grotesque heads of animals. There is a peculiarity worth noticing in this hinge, and that is that the scrolls do not flow gracefully out of the curves and bars, but seem to be forged on afterwards—the point of junction, which is marked with a little fillet, being very abrupt.

During the fourteenth century the smith found plenty of employment; the hinges, though not quite so elaborate as in the preceding era, were universal as to their use, but instead of the leaves and rosettes as used in the previous century, we find the ends beaten out flatter, and sometimes cut in the conventional form of a leaf, but more frequently of a *fleur-de-lis*. Howden Church possesses one of the best examples, and in the upper part of this too is an additional pattern formed of two interlacing squares, one set diagonally, the ends having *fleur-de-lis*, and in the centre of these figures is a cruciform pattern of four *fleur-de-lis* joined at their bases.

In Germany this leaf termination was almost general. Marburg, Magdeburg, Treysa, Nieukirchen, Meissen, Eschwege, and the Rhine Provinces have numerous examples, but they lack the beauty of the English and French examples—the straps are thin and spidery and the curves abrupt and often repeated; while with us it is only one case in ten that the upper curve resembles the lower. The collegiate church of St. Elizabeth, Marburg, has a very good example, and Erfurt Cathedral also; but in the mechanism of locks, bolts, fastenings, and door-handles they were far in advance of us, and these are invariably very quaint and full of vigour.

During the fourteenth century Italy was renowned for its smith's work, especially in grilles and railings and in articles of domestic use, but this deserves a special paper, and time will not allow this branch of the subject to be dealt with here.

Icklinworth, in Suffolk, possess a fine parish chest which is covered with ironwork; the hinges and straps are elaborately engraved, and although the chest is only 5 feet 9 inches long, by 1 foot 4 inches deep and 1 foot 10 inches broad, there are five hinges, with scrolls covering the intervening spaces and ends, and a rim of metal surrounds the edges, with rings attached on the front near the two ends. This might have been a vestment chest, as it is a little too early for parish chests.

During the next two centuries the prominence hitherto given to the hinge sensibly declined. Partly from the reason that it had become the fashion to make more of the wood-work and to enrich it with carving or moulding, the hinge now played a very secondary part, and in some cases it was simply a band of metal passing behind the perpendicular mouldings of the door, and terminating in a *fleur-de-lis*; but the door was also thickly studded with nail-heads. In the screenwork and grilles of this period of the fifteenth century a like decadence was manifest. The tombs of the great still required grilles to protect them, but the designs of these were generally stiff and poor. The screen of Henry V.'s chantry at Westminster is typical of this, and its very proximity to the grille of Queen Eleanor's tomb makes this decadence the more apparent; but while the hinge and grille decreased in beauty, more attention was paid to locks, fastenings, and door handles—many of these being very beautiful. There is a very excellent example of a lock at Ely Cathedral, and at Bedington Hall, near Croydon, and in many other places. The railings round the tombs of Edward the Black Prince, Canterbury Cathedral, and Henry IV., and that round the tomb of Simon de Langham, Archbishop of Canterbury, in the chapel of St. Benedict, Westminster Abbey—very similar to the two first-mentioned tombs—make up in strength what they lack in beauty, and seem to have been the prototypes of those miles and miles of iron railings with which we are so familiar in London.

At Arundel Church, Sussex, there is a light and graceful iron grille in the blocked chancel arch; the design consists of upright standards and cross bars and small cusped arching between, and a battlemented cornice enriched with alternate roses and lions' heads. It is much to be regretted that the full beauty of this elegant grille cannot be properly appreciated in consequence of the ugly brick wall which the Duke of Norfolk has caused to be built immediately behind it, in order to enforce his legal rights to the chancel. The very existence of this grille testifies that whatever those legal rights may be, the parishioners, although debarred the use of the chancel, were certainly not debarred the sight of it through this grille; nor was the effect of a beautiful interior ruined by such an act of vandalism, worthy of the worst days of those Puritans who divided Exeter Cathedral with a brick wall between the nave and choir. Extremes very often meet.

In Germany the open grilles of this period were of excellent design and workmanship. One very common form which they assumed was that of a cross-barred grille, with a delicate pattern occurring at intervals of a cusped form; sometimes the bars were set diagonally. There is an infinite variety of form of grille throughout Germany. Louvain, in the church of St. Peter, has some excellent examples, and in the same church is an aumbry with simple but finely-designed hinges, hock-plates, and handles. These aumbries, of which there are a great many in Belgium and Germany, deserve a very close inspection, in consequence of the extreme beauty of their metal-work. In South Kensington Museum there is a very perfect carved oak one, called German, but more properly Flemish. The metal-work on this is very original. In England we have but few examples, but there is a very good one in the church of St. Mary, Richmond, Yorkshire. Nuremberg and Augsburg were the two chief places where this art was carried on. These two cities were then at the zenith of their prosperity, and their trade uninjured by those devastating wars which reduced them to misery, and from which Augsburg at least never fully recovered.

There is one particular phase of the smith's art in England which deserves more than a passing notice. The great impetus given to the industrial arts by the universal rebuilding which took place after the great fire of London exercised a considerable influence on the art of the smith; and there is the peculiarity attaching to the revival, that the productions are essentially English, and are unlike the contemporary work on the Continent, preserving an individuality perfectly marked and distinct; one might almost call it a "school," and it lasted for nearly a hundred years.

St. Paul's Cathedral, which was commenced in 1675, and the choir so far completed that it was opened for service in 1697, possesses some of the finest specimens of this date in the grilles and gates enclosing the choir, and although one is bound to confess that it was to a foreigner and not to a native artist that these are due, yet in many particulars they resemble genuine English work; one has but to compare these gates with others of the same date in France, to directly see the immense difference between them, as in the enclosures of the choir of the Abbey

Church of St. Quen at Rouen, and at the cathedral at Amiens. The artist's name was Tijau or Tijou, for the orthography is doubtful. In addition to these large gates, the original positions of which have been altered since the re-arrangement of the Cathedral, there are several smaller grilles in some of the openings and escutcheons to some of the internal gates with the arms of the Dean and Chapter very beautifully worked into the design; the whole of the ironwork at St. Paul's deserves a close inspection. The outer railings, which are partly cast, are of Sussex iron, and were made at Lamberhurst.

Most of the City churches have very good ironwork, especially in the sword rests and communion rails, some of the finest of the former being at All Hallows Barking; St. Andrew, Undershaft; and St. Mary at Hill; and the latter at St. Mary, Woolnoth. The altars of some of these City churches are marble slabs supported on a frame of wrought ironwork. In the Church of St. Michael, Queenhythe, now destroyed, there was a very curious iron bracket,\* with pulley and chain for the font cover, and some wrought-iron hat rails. Though the hinges and locks of these churches are not remarkable, many of the vanes are curious. St. Lawrence, Jewry, has a gridiron in allusion to the martyrdom of the saint. St. Mildred Poultry, and St. Michael, Queenhythe, both destroyed, bore ships in full sail; St. Peter's, Cornhill, the cross keys; St. Mary-le-Bow has a flying dragon; and St. Antholin, Budge Row, had a very fine vane surmounted by a crown. The destruction of this church and spire, one of the most beautiful in the City, will ever be a lasting disgrace to those who brought it about. In the church of St. Dionis Backchurch, at the west end, supporting the organ-gallery, stood square columns of open work of wrought iron, and with very nicely wrought caps, but the church has also been destroyed, and the pillars probably sold for old iron.† Some of the brass chandeliers, where they had not been made away with, to be replaced by gas standards or brackets, are suspended by ironwork more or less ornamented and gilded, a good specimen having existed at the church of St. Catherine Cree, and there is still one remaining at St. Saviour's, Southwark. At St. Alban's, Wood Street, a curious hour-glass is preserved in a wrought-iron frame, a relic of Puritan times; and though hour-glasses and their stands are not uncommon, it is a comparative rarity when found in a church of the date of St. Alban's, Wood Street.

The smith also found plenty of occupation in making railings and gates for public bodies and for private houses, and wrought-iron handrails to staircases.

One of the most beautiful specimens of the art of the seventeenth century is to be seen in a pair of gates at the end of a passage or hall in the building occupied by the Managers and Trustees of the Bridewell Hospital, Bridge Street, Blackfriars; the wrought leaves and scrolls are very rich, being designed for internal work, and date from very soon after the fire of London.

The Honourable and learned Societies of Gray's Inn and the Inner Temple have fine scroll entrance-gates to their respective gardens; and scattered about in the suburbs at Clapham, Chelsea, Fulham, Stoke Newington, Stratford-by-Bow, and Hampstead are fine entrance-gates, whose designs are doubtless very familiar, since there is scarcely an old brick mansion with red tiled roof, and dormer windows, and walled garden, that does not possess them. There is considerable beauty about these gates; the manner in which the upright standards are alternated with panels of scroll-work, and the upper part enriched with scrolls and leaves, and the initials of the owner or his arms worked in, some of this work indeed being very delicate and refined, especially with regard to the foliage. But the chief glory of the English school of this date is the wonderful work upon the gates, now preserved at Kensington Museum, formerly adorning the gardens at Hampton Court Palace, and the work of Huntingdon Shaw. These are far superior to the gates in St. Paul's Cathedral, for the latter are a little too architectural in their treatment, Corinthian pilasters being freely introduced; while these Hampton Court ones are free from any approach to architectural forms in iron, and rely for effect entirely upon the bold curves and sweeps of the scrolls, the richness of the acanthus-like foliage, and the delicacy of the centre medallions. The wreaths, which are suspended from the top, are wonderfully modelled, some of the flowers introduced being almost as delicate as the natural ones they represent, or rather reproduce, in iron; one medallion in particular, representing the rose of England surrounded by small buds and leaves, being truly exquisite. At the top of each of the gates are some fine masks, in some cases surrounded by foliage, and each gate is different in design, although they resemble one another in general form. South Kensington Museum possesses six of these gates—one with a rose, another with a thistle; this last one is superbly modelled, the peculiarity and bend of the leaf being accurately rendered. Another has the harp of Ireland, but with strings rent and broken, emblematic of the present state of that unhappy country; and three have the initials of William of Orange and Mary Stuart. If William's name in these days may not be quite so popular as it once was, and if he did but little for the country over which he

was called to govern by a dominant party, at least he was the means of calling into existence these exquisite works of art, which hold their own against any foreign production, and place the smith, Huntingdon Shaw, foremost among those who, working with stalwart arm, with anvil and hammer, were able to throw life and energy into the dull mass of metal before them.

In the staircase of a house in Lincoln's Inn Fields, at No. 35, there is a wonderful specimen of a wrought-iron staircase rail. At present this wrought work terminates at the first floor, but there is evidence of it having been continued to the second floor, a panel having been once sold at Christy's for 40*l.* which purported to have come from No. 35 Lincoln's Inn Fields, and had been removed in consequence of extensive alterations in the interior. The rail is composed of separate standards, with scrolls and leaves, until it reaches the landing, which sweeps round a circular well-hole; round this the standards cease, and are replaced by an extraordinarily fine panel, in which one can recognise the same hand as in Hampton Court gates. There is the same wonderfully-modelled mask with foliage proceeding from it, the same sort of wreath depending in advance of the other work, the rich acanthus foliage partly masking the boldly-designed scrolls beneath, betraying the hand of Huntingdon Shaw or his school. The date would also fit, for this house and the next are traditionally supposed to have been designed by Christopher Wren for the Solicitor and Attorney-Generals about 1695-96, the date of the Hampton Court work. The centre oval medallion of this panel has unfortunately gone, and is replaced by some initials in cast iron; but it probably contained some of those beautifully-modelled bunches of flowers which appear on the Hampton Court gates.

In concluding the paper Mr. Birch referred to the staircase ironwork of No. 5 Bloomsbury Square, the house of Isaac Disraeli, and to various other interesting examples scattered up and down London.

## THE GLASGOW INSTITUTE OF ARCHITECTS AND THE MUNICIPAL BUILDINGS COMPETITION.

A SPECIAL general meeting of the Institute was held in the chambers of Messrs. William and C. J. MacLean, Writers, 196 St. Vincent Street, on Tuesday; Mr. John Honeyman, F.R.I.B.A., President, occupied the chair.

Mr. William MacLean, the secretary, reported that the Council of the Institute had sent a letter to the Lord Provost as to the public exhibition of the designs for the new Municipal Buildings; that the Lord Provost had submitted this letter to the Municipal Buildings Committee of the Town Council, who have declined to carry out the suggestion that the designs should be publicly exhibited; that the Council of the Institute, having again considered the matter, resolved that steps should be taken to ascertain whether the competitors, or a majority of them, would wish their drawings to be exhibited; that accordingly a circular is in course of being sent to the secretaries of the various architectural societies throughout the country.

The President said he had no doubt that the refusal of the Town Council to exhibit the rejected designs along with the one which had been chosen would cause general dissatisfaction, not only among architects, but among all who took any interest in the proposed undertaking. Although the condition bearing on the point was somewhat obscure, the intention of the promoters, no doubt, was that there should be no public exhibition of designs until after the final award. Many competitors thought that there ought to have been such an exhibition before the final award—there was considerable diversity of opinion as to this, and there was room for such diversity; but he thought every one would agree that in all important competitions there ought to be an exhibition of the designs after the decision, if not before it. It was only what was due to the competitors, who of course had a laudable desire to show what they had achieved—how nearly they approached success, what they thought good or even best, whatever other people might think. It was due also to the public, who were really through their representatives the promoters of this competition, and many of whom took an intelligent interest in it, and wished to judge for themselves how many well-known local architects had borne themselves in the contest, and whether they were ignominiously defeated or not—and most naturally and properly so, although their town councillors seemed to be of a different opinion. The truth, was that a competition such as this, without an exhibition of all the designs, was like a race in which only the winner and none other should be visible. The idea that people were not interested in any but the winning design, or boat, or horse, or anything else, was simply monstrous. But such an exhibition of all the designs as the Institute had recommended was due to the Town Council and their advisers themselves. They were of course prepared to justify their selection, but they certainly would not inspire confidence in the wisdom of their decision by refusing to exhibit along with the chosen design those they had rejected. He did not say, because he did not believe, that they were afraid to exhibit all the designs together, but it was extremely difficult to imagine any valid reason for their refusal to do so. As

\* Now in the possession of Messrs. Gardner.

† These were fortunately not destroyed, and are in the possession of Messrs. Trollope.

they were aware, he was not a competitor himself, and he spoke dispassionately; but he must say that he regretted this refusal exceedingly, and all the more because up to this point the Council had acted in such a way as to merit the highest commendation, and the influence of their example would certainly be beneficial in the conduct of future competitions. In the circumstances their Institute seemed to be called upon to do what the Town Council ought to have done; and although the task of organisation was no light one, he was sure they might reckon on the approbation and hearty support of their fellow-citizens, and that the proposed exhibition would be highly interesting and instructive.

On the motion of Mr. Sellars, seconded by Mr. Bromhead, the meeting unanimously approved of the action of the Council of the Institute, and remitted to them to make the necessary arrangements for the proposed exhibition, provided in their opinion a sufficient number of the competitors are desirous of exhibiting their designs.

Some other business of a formal nature was transacted.

### THE NATIONAL GALLERY.

THE following pictures have been added to the National Gallery from the Hamilton Palace collection:—1, Henri de Bles, called Civetta (?), *St. Jerome*, with a lion near a cavern, and landscape beyond, 493*l.* 10*s.*; 2, Leonardo da Vinci, portrait of a gentleman, 525*l.*; 3, Tintoretto, *Christ Washing the Disciples' Feet*, 157*l.* 10*s.*; 4, Giorgione, *The Story of Myrrha*, 1,417*l.* 10*s.*; 5, Sandro Botticelli, *The Adoration of the Magi*, in a landscape, with procession of the kings and some pilgrims, 1,627*l.* 10*s.*; 6, Andrea Mantegna, a pair of upright panels, painted with figures of Summer and Autumn in monochrome, 1,785*l.*; 7, Sandro Botticelli, *The Assumption of the Virgin*, the large gallery picture with numerous figures in circular rows in the sky, and landscape below, with figures of the Apostles at the tomb of the Virgin and the donor with his wife, 4,777*l.* 10*s.*; 8, Titian (?), portrait of Ludovico Cornaro, *et. sue* 100, 1566, 336*l.*; 9, Masaccio (?), *The Last Supper*, a cabinet picture, 12 in. by 8½ in., 630*l.*; 10, Giacomo da Pontormo (?), an allegory with numerous figures, 315*l.*; 11, Luca Signorelli, *The Circumcision*, large altar picture, with ten life-size figures, 3,150*l.*; 12, Steenwyck and F. Francks, an interior of a house, with figures, a small picture, 8½ in. by 12 in., 204*l.* 15*s.*; 13, Velasquez, portrait of Philip IV. of Spain, standing, whole length, life-size, wearing the Order of the Golden Fleece, in a black dress trimmed with silver, holding a paper inscribed with the name of Velasquez, 6,300*l.* The sum thus expended amounts to 21,719*l.* 5*s.*, which is said to be considerably under the grant made by the Treasury. For the National Portrait Gallery the only purchase was the large portrait-piece representing the Council of English and Spanish Royal Commissioners assembled at old Somerset House in 1604, considered by Mr. Scharf to be the work of Mark Gheeraedts, and not by Juan Pantoja de la Cruz as stated, 2,520*l.* For the National Gallery of Ireland four pictures were purchased by the director, Mr. Doyle:—1, Francia, *Madonna and Child*, attended by a monk and a nun, 262*l.* 10*s.*; 2, Leonardo da Vinci, portrait of a gentleman, inscribed "Alessandro Oliverius V.," 215*l.* 5*s.*; 3, Bonifazio, *The Resurrection*, a large picture, 231*l.*; 4, N. Poussin, *The Entombment*, 504*l.* The sum thus expended amounts to 1,212*l.* 15*s.*, and the gross expenditure in the acquisition of the eighteen pictures for the national collections comes to 25,452*l.*

### MANCHESTER CATHEDRAL.

A REPORT has been prepared by Mr. Joseph Crowther, architect, on the condition of the nave of Manchester Cathedral. It is as follows:—

Amongst the few remaining relics of mediæval Manchester, the cathedral, no less from its architectural pretensions than from its ecclesiastical importance and venerable associations, holds the most distinguished place; and the parishioners will be interested to learn that, after an interval of some years of rest, active measures are again being taken towards the further restoration of the fabric. The renovation of the exterior of the church has been in great part accomplished, but little comparatively has been done towards the restoration of the interior of the fabric, of which that of the nave is now in progress.

Early in the present century the then guardians of the fabric were advised that the whole of the pier arches of the nave and aisles, the great chancel arch, and the superincumbent masonry, including the clerestory, were in so bad a state of dilapidation from the combined effects of time and rough usage as to need extensive reparation, improvement, and strengthening; and the authorities with the best intentions entrusted the execution of this important work to the incompetent persons who had reported on it. It will scarcely be believed that the initiative step taken by these iconoclasts was to cut away the delicately-moulded capitals and bases of the columns and bay shafts, the traceried spandrels over the arches, and the Tudor leaf cresting of the stringcourse surmounting them, and roughly hew all the remaining surfaces of the masonry, including the finely-moulded columns and arches, pre-

paratory to coating the whole with Roman cement. A more recklessly dangerous piece of spoliation it is impossible to conceive, for so far from "repairing, improving, and strengthening" the structure, it was materially weakened by the process—in some vital portions of it to a most dangerous extent. For example, on carefully removing the cement coating from the two most westerly bays on the north side, it was found that the springing stones of the arches immediately resting on the columns had been so much cut away as to leave an area of little more than 14 inches square of solid stone to carry the enormous superincumbent load! A careful calculation of the load which was borne by these stones shows that their reduced sectional area was barely sufficient to sustain it, with the fabric in a state of absolute rest and free from any lateral strain. The wonder, therefore, is that during violent storms of wind, such as that of the great tornado of January 1839, when the pressure of the wind was equal to 50 lbs. on the square foot, and the lofty clerestory must of necessity have been oscillating from so enormous a lateral strain, the whole structure of the nave did not collapse. There can be no doubt that the remaining springers have been cut away to the same extent in order to provide for the cement coating. With equally ignorant recklessness the columns themselves, and especially the bases sustaining them, had been mercilessly cut away, and one of the latter—that viz. of the most easterly column—was patched up with brick! The original architecture of these arcades was of great beauty and delicacy, and the work was so admirably executed and put together that, although of unusual lightness, it was quite adequate to its static requirements, and to withstand the effects of time. But the gifted architect who designed this noble church so constructed the fabric and its various details that not a cubic foot of stone more than necessary was used in the work, especially in this portion of it. A practised eye will at once detect this feature of the construction on examining the masonry of the columns and arches which have been stripped of the cement coating, and fully appreciate the danger to the fabric occasioned by the reckless cutting away of the stonework in order to form a ground and key for the cement coating.

Nor was the reckless treatment of these iconoclasts less mischievous in its results to the beauty of the architecture. It is obvious that the coating of cement, averaging nearly an inch in thickness, necessarily changed completely the sectional form of the mouldings, and destroyed their relative proportions; for whilst the delicate projecting members were much enlarged, and nearly doubled in size in some cases, the equally delicate hollows were almost filled up, or so reduced in width and depth as to grievously mar the æsthetic beauty of the whole work. Happily sufficient portions of the ancient design and mouldings remained for the exact restoration of the original architecture of the north and south sides of the nave. The chancel arch, with its great piers forming the eastern termination of the nave, has been, if possible, more grievously mutilated than the lateral arcades, for the masonry of the piers—which contain winding staircases leading to the roof—has been in parts reduced to a thickness of 3 inches only—a thickness miserably inadequate to the weight it carries. The arch itself has met with even worse usage. Iron hooks have been driven into the joints of the voussours, on the western or nave side, and on these a rim of brickwork was constructed. The spandrels and wall above the brick arch were then lined with wooden studs, lathed and plastered, and the whole of the surfaces covered with panelled tracery of meretricious design, worked in Roman cement. The masonry of the arch and heavy wall above it has been seriously shaken and disrupted by the process of driving in the iron hooks, and the stonework has settled downward in consequence, depressing the arch about five or six inches from its original contour. There are sufficient remains of the arch mouldings and general design of the whole original composition for the exact restoration of the chancel arch and piers; and happily the latter, below the level of the ancient rood loft, have not been coated with cement, and are in a nearly perfect condition.

During the process of shoring up the nave arcades and staying the clerestory walls, previously to removing the mutilated columns and arches, it became necessary to ascertain the condition of the roof timbers, because on the soundness of these the safety of the structure mainly depended during the delicate and somewhat difficult operation of removing and reinstating the columns and arches. On removing the external and traceried lining of the tie beam of the most westerly roof principal, I was much startled to find that the tie beam was completely worm-eaten through three-fourths of its sectional area, and that it was no longer performing its office as a tie, but was simply suspended *in situ* by the principal rafters above, and the whole weight of the principal itself and of the most westerly bay of the roof was sustained by the mortising of the rafters into the king post in the centre, and at the ends by the wall posts and curved struts. This morning, July 3 (more of the external facing of the roof principal and of the bosses in connection having been removed since my last examination), I was able to get at the principal rafters themselves and the joints or the connections of the purlins with the rafters. The north rafter of the principal proved to be in as decayed a state as the tie beam, for with very slight pressure a chisel penetrated for its whole length into the timber, and on drawing it out a piece of the worm-

eaten surface came with it, and that which had been the heart of the beam poured out in the form of dust. The roof appears to have been extensively repaired shortly before the ceiling was painted some thirty-five years since, for the purlins are suspended by wrought-iron straps to the principals, and the transverse ribs in like manner to the purlins, from which it would appear that at that time the tenons of the framing were found to be so decayed as to need the help of the straps for their support. The ends of the tie beams of this principal do not bed directly on the clerestory walls, but on a strong oak corbel piece bedded on the masonry, and projecting about two feet into the nave, and into this corbel piece the head of the wall-posts is framed. I cannot confidently say at present whether or no this is the original construction; but it appears to be so from the circumstance that a portion of the traceried spandril of the curved strut is worked upon it. Happily the north corbel is quite sound, but the wall-post and the lower portion of the curved strut below it are in an advanced state of decay.

From the foregoing description it will be seen that the several timbers of the roof principals are, in technical language, "built up," that is to say, the timbers forming the chief framework are simply plain squared beams, covered over or lined out with richly-moulded and traceried casings wrought on comparatively thin scantlings of oak, which are pinned with oak pins to the solid inner frame, and formed the surfaces exposed to view. A considerable portion of these applied enrichments have, so far, proved to be tolerably sound, and the same may be said of the wonderfully rich and varied bosses placed at the intersection of the moulded timbers forming the panelled ceiling betwixt the principals. So far as I can at present judge, the plain foundation of the principals will chiefly have to be replaced by new timbers on which the ancient casings and enrichments, so far as they are sound, can be fixed as heretofore, and on this assumption, after making sufficient allowance for renewing decayed portions of the latter, I have formed the following estimate:—

*Estimate of Cost of Restoring the Roof over the Nave.*

No. 7 principals, at £125 . . . .	£875 0 0
No. 6 bays, at £150 . . . .	900 0 0
Removing the lead and roof timbers . .	85 0 0
Shoring up and scaffolding . . . .	120 0 0
Relaying the lead and gutters, &c. . .	80 0 0
Total . . . . .	£2,060 0 0

A meeting has been held, at which it was resolved to ask Mr. Crowther to prepare a second report on the condition of the building before subscriptions are solicited.

## PUBLIC WORKS IN GREECE.

THE enterprise of cutting a ship canal through the Isthmus of Corinth, which was begun, according to Strabo, by Demetrius I. (surnamed Poliorcetes) more than 2,000 years ago, and abandoned because the engineers of that period supposed that the seas in the two gulfs were not of the same level, and which subsequently baffled the efforts of Julius Cæsar, Caligula, Nero, and finally Herodes Atticus, appears likely to be recommenced in the present day under more favourable and probable prospects for its successful termination by "the modern Hercules"—a joint-stock company. A group of Greek and French capitalists have offered to form a society for the purpose of cutting this canal, provided that certain modifications which they have proposed be made in the law defining the terms upon which this concession is to be granted to any company willing to undertake the enterprise under specified conditions. As soon as a Bill has passed the Chamber of Deputies and received the royal sanction, the promoters are prepared to form a company, under the presidency of General Turr, to carry out the enterprise.

The cost of this undertaking is estimated at 30,000,000 francs, and it is expected that it will be terminated within four years from its actual commencement. Some preliminary works have been already commenced, and shafts sunk to ascertain the nature and hardness of the rocks through which a channel will have to be cut. The chief engineer, M. Gersser, with a competent staff of assistants, are on the spot studying the ground.

The convention for carrying out the dessication of the Copaic Lake has been conceded to a French company, under the title of the "Compagnie Française pour le dessèchement et l'Exploitation du Lac Copaïs." The capital of the company is fixed at 15,000,000 francs, divided into 30,000 shares of 500 francs each, the whole of which have been already allotted, and on which 250 francs per share are paid up. The duration of the society is for 99 years, commencing from the date of its definitive constitution. As may be inferred from its title, the principal object of this company is the draining and reclaiming of the vast marsh or pestilent morass, at present known under the name of the Copaic lake, which now extends over a great portion of the barren province of Livadia, and the miasma from which, in summer and autumn, renders the neighbouring country nearly uninhabitable. The extent of land which it is thus proposed to reclaim and bring under cultivation is calculated at 24,000 hectares,

equal to about 58,000 square acres, of which 8,000 hectares will become the absolute property of the company after the expiration of the 99 years, during which time the whole of the land reclaimed will belong to the society, after which period, with the exception of the above-mentioned 8,000 hectares, the rest will lapse to the State. The preliminary works have been already commenced.

The only railway in Greece at the present day is one of 6 miles in length connecting the Piræus with Athens. This line is a single one, with a junction at the Phalerum, where the train stops to take up and set down passengers. Two new lines of railway are in the course of construction, namely, one in the Peloponnesus, from Pyrgos to Katakolo, a distance of 7 miles; and another from Larissa to Volo, in Thessaly, about 30 miles in length. Several other lines of railway are, however, projected, and various conventions have from time to time been made between the promoters of companies on the one part, and the Greek Ministry of the day on the other, for the construction of lines of railways in Greece. Very few, however, if any, of these conventions have ever advanced beyond their preliminary stages, or have received the consent and approval of the Chamber of Deputies. The following are the principal and most important of these proposed lines, namely:—A railway through Northern Greece, passing by Thebes, Livadia, and Lamia, &c., to Larissa, in Thessaly, the concession for which, it is said, has been provisionally conceded to the same French company which is now engaged in constructing the line of railway from Larissa to Volo, and which has also offered to make a line from Athens to Patras by the Isthmus of Corinth, which will follow the sea-coast along the southern shores of the Gulf of Corinth.

A proposal has been made by an Anglo-French company for shortening the transit of the Indian mail to Brindisi by opening a line of railway from the Port of Monembasia through the Peloponnesus, crossing the Gulf of Corinth at its narrowest point near Patras 'at the castles of Rio and Anti-Rio by means of a steam-ferry, and then running through Western Acarnania to a port in Albania opposite Brindisi, to which place the mails and passengers would be conveyed in quick and powerful steamers across the Adriatic. It is calculated that by means of this route the Indian mail would reach Brindisi from Port Said thirty-six hours sooner than it does at present, and that the vessels of the Peninsular and Oriental Steam Navigation Company would run to Monembasia, instead of Brindisi, from Port Said, and *vice versa*.

A Belgian company is now engaged in laying down the tramways in some of the principal streets in Athens. It is proposed to extend these lines to the Phalerum Bay, Piræus, &c. The streets of the Piræus are now fairly lighted with gas, but it is introduced into very few of the dwelling-houses. The cost is about three times greater than it is in England. The esplanade at the Phalerum and the Railway Hotel are lighted by means of the electric light on the Jablochkoff system.

The present supply of water, both in the towns of the Piræus and Athens, is very deficient in quantity for the number of inhabitants, and bad in quality during the summer months; the recent outbreaks of typhoid fever in Athens, which assumed an epidemic form last summer, being mainly attributed to the impurity of the water supplied to that town. Several English, French, and other companies have made offers to the Municipality of Athens for the purpose of remedying this deficiency and bringing water from long distances. The subject is one of great importance as regards the future increase and extension of the towns of Athens and the Piræus. But up to this time the Municipality of Athens, whose finances are not in a very flourishing condition, has not yet decided on accepting the terms of any of the rival companies or contractors.

## UNIVERSITY COLLEGE, LONDON.

THE following are the results of examinations of work done in the class of Architecture:—

*Modern Practice.*—Prize: A. W. Glasson. 2nd prize: H. W. R. Martin. 2nd class certificate: T. Andrews. 3rd class certificates: W. H. A. Barry, C. M. Shiner, J. E. Sears, P. Condy, G. P. K. Young. Twenty-one attended the lectures. Ten attended the examination.

*Art.*—Medal: W. C. Jones. Prize: H. W. R. Martin. 2nd class certificate: R. W. Hamilton. 3rd class certificates: W. G. King, L. Conder, P. Condy, F. P. Oakley. Nineteen attended the lectures. Eleven attended the examination.

*Construction.*—Medal: C. M. Shiner. 2nd prize: G. R. K. Young. 3rd prize: W. C. Jones. 4th certificate: H. C. Simmons. 1st class certificates, with marks entitled to prize: P. Condy, W. G. King, J. E. Sears. 2nd class certificates: H. Woodroffe, H. W. R. Martin. 3rd class certificates: H. W. Moxon, B. V. Westbrook, W. J. Gibbon, R. M. Hamilton, W. J. Gargery. Twenty-six attended the lectures. Nineteen attended the examination.

**Burham.**—The new church of St. Mary, at Burham, has been opened. The church has been erected from the plans of Mr. E. W. Stephens, architect, of Maidstone, the building being designed in Early Decorated style. Messrs. Naylar & Son, of Rochester, were the builders.

## NOTES AND COMMENTS.

THE programme of the Social Science Congress at Nottingham may comprise subjects which are useful, but nevertheless they are not attractive. In the Art Department they are as follows:—On the new Royal College of Music. In what way can the influence of Art be brought to bear on the masses of the population in large towns? What are the proper limits of conservatism in regard to ancient buildings? The Health Department will consider infant mortality, hospital administration, and infectious diseases. The meetings will be held during the week ending September 27, and University College, the Masonic Hall, and the Mechanics' Institution have been placed at the disposal of the Committee.

At its last sitting the French Artists' Committee of "Ninety" finally discussed and voted the regulations for next year's Salon. We have already mentioned several of the proposed alterations in the *règlement*; these have now been adopted, but do not form any great departure from the rules of the 1882 Exhibition. The most important, perhaps, of all the changes is the one which increases the number of medals from thirty-two to forty-two, seven of which will be absolutely reserved for foreign artists.

AN address was delivered by Mr. E. C. ROBINS, F.S.A., on Thursday, at the Royal Institution, descriptive of the work of the Sanitary Institution. He described among other things some experiments of Dr. RENK, at the Hygienic Institution at Munich, which were undertaken to discover the conditions under which ground air entered houses. They follow out the investigations of Dr. PETTENKOFER. By means of a differential manometer Dr. RENK discovered that in a house at Munich the air in the ground beneath the paving of the cellars was always under a higher pressure than the air of the cellar itself, from which result he inferred that the ground air is always in motion from the soil into the house—the pavement, being bricks laid in mortar, was permeable by air. This higher pressure of the air under the house he found was caused by the wind and by the difference in temperature between the inside and the outside of the house. It happened that in and under the cellar paving a draught-channel for ventilating purposes was situated, being constructed of bricks and mortar, and covered with stone slabs. The channel was connected with the chimney of the boiler which generated the steam for the heating apparatus. This draught-channel had a very great influence on the ground air to a distance of six yards from its walls, and the ground air was more attracted by the current of air passing through the draught-channel than by the air in the basement of the house. Moreover, the air of the cellar was in like manner, for a certain distance from it, drawn into the same draught-channel current, and with increasing rapidity the nearer it approached the channel. This experiment suggested to Dr. RENK a means of keeping ground air out of houses—that is, by permeable tubes connected with the chimney of the kitchen fire, up the flue of which a constant current being kept up, thereby a sufficient draught is created to withdraw the ground air from the soil and carry it above the roofs.

FOR some time past there have been negotiations between the Ministry of Beaux-Arts and the city of Paris in reference to the foundation of a School of Decorative Art. The authorities, after much consideration, have at last decided upon a site suitable for the erection of the necessary buildings, viz., that occupied at present by a wing of the old Hôtel-Dieu. The building still contains a number of beds, which cannot be removed until the new hospital, now in course of construction at the Porte St. Ouen, is completed, which will probably be before the end of the year; the construction of the new School of Decorative Art may therefore be commenced with the new year. The city of Paris will find the site, which will have to be purchased from the Assistance Publique (similar to the English Charity Commissioners), while the State is to bear the expense of the building, fitting up, &c.

THE French Minister of the Interior has nominated a Commission charged to draw up a scheme whereby co-operative associations of working-men may participate in the competition and adjudication of State works. He has requested each of his Ministerial colleagues to name two gentlemen from their several departments to serve on this Commission.

SEVERAL new buildings are about to be erected on the Blackden Estate, Fore Street, in the City, at an estimated cost of 30,000*l.* On Wednesday Messrs. Fox & BOUSFIELD let six of the sites on building leases for terms of eighty years. In letting the property the auctioneer said that the purchaser of each site must enter into an undertaking to expend a sum which would be named in the erection of new buildings, the lessor's architect certifying that such an amount had been expended before an underlease by the lessee would be sanctioned. The first lot submitted was withdrawn, but all the other lots were let. Lot 2 consisted of Nos. 46, 47, and 48 Fore Street, and on the site 4,500*l.* is to be expended in new buildings. It was let at an annual ground rent of 300*l.* The next lot, containing an area of 1,381 feet, was let at a ground rent of 180*l.* per annum; 2,500*l.* to be expended in new buildings. Another lot, containing an area of 1,898 feet, was let at a ground rent of 220*l.* per annum; 3,000 to be expended on new buildings. The fourth lot, containing an area of 3,852 feet, and on which 7,000*l.* was to be expended in building, was let at an annual ground rent of 610*l.* The last lot, containing an area of 9,222 feet, was let at an annual ground rent of 910*l.*, the amount to be expended in new buildings on the site being 17,000*l.*

IN reply to the petition of the French artists praying for leave to organise and issue tickets for a lottery to raise upwards of 500,000*l.* for the erection of an exhibition building of their own, the Minister of the Interior has returned an evasive or rather a procrastinating answer, to the effect that he cannot pronounce definitely on the question until after the end of the present year. This reply is generally looked upon as a polite way of throwing cold water on the scheme, which has certainly not found favour in Ministerial eyes, and is thus decently interred for the present.

THE large room at the Cannon Street Hotel was crowded on Tuesday last, when the Barnsbury Park Estate in Islington was sold. The rentals were represented as amounting to 14,000*l.* per annum. The property was offered in 85 lots, 46 of which consisted of freehold ground-rents, amounting to 812*l.* 10*s.* per annum; and 39 lots consisted of freehold residences on the estate, let on lease for terms expiring in twenty-six years, at a peppercorn rent. The property covers a ground area of 27 acres, and comprises upwards of 300 houses. MESSRS. DEBENHAM, TEWSON, FARMER & BRIDGEWATER were the auctioneers, and Mr. TEWSON, who conducted the sale, said it was one of the most valuable and important properties in the metropolis that he had ever offered. There was an eager demand for the several lots, the whole of which were sold, the aggregate amount realised in anticipation of the prospective rental of 14,000*l.* a year being between 73,000*l.* and 74,000*l.*

A COLOSSAL equestrian statue of CHARLEMAGNE is about to be erected in the new square now in progress near Notre Dame, on the site of the Hôtel Dieu, Paris. The statue, which was originally exhibited at the Exposition of 1878, is the work of the brothers ROCHET, one of whom died, it is said, from the fatigues of its execution. It is in bronze, upwards of 25 feet high, and will be mounted on a 16-foot pedestal, specially designed for it by M. VIOLETT LE DUC a short time before his death.

AN influential committee has been formed for the purpose of obtaining subscriptions towards the erection of an appropriate memorial to SAMUEL PEPYS in the Church of St. Olave's, Hart Street. It seems strange that no monument of any kind should exist in the church with which the Diarist was so intimately connected, and where he was buried, and it is thought that many of those who have experienced pleasure in reading the Diary will be willing to contribute something in order that the proposal may be carried out satisfactorily. The committee consists of the chief representatives of the institutions with which PEPYS was connected, viz., the Master of Magdalene College, Cambridge, the President of the Royal Society, the Deputy Master of the Trinity House, the Secretary to the Admiralty, the Master of the Clothworkers' Company, and some others. The treasurer is Mr. OWEN ROBERTS, clerk to the Clothworkers' Company; and Mr. HENRY B. WHEATLEY, 6 Minford Gardens, W., is honorary secretary.

AGRICULTURE IN INDIA  
(THE GREAT OXEN)

## ILLUSTRATIONS.

AGRICULTURE: A DECORATIVE FRIEZE.—PART III.

THE DANISH OCCUPATION OF LINCOLNSHIRE  
ILLUSTRATED BY LOCAL NAMES.\*

NO person of observation, transplanted from one of the southern counties of England to Lincolnshire, can fail to be struck with the difference in the character of the local names of the two districts. The "hursts" and "dens" with which he has been familiar in Kent and Sussex have totally disappeared. The "leys" and "worths" appear but scantily, while the "tons" and "stokes," which are there so abundant, though to be found in fair numbers, are few in comparison. In their place a new set of terminatives present themselves. "Bys" by the score, "thorps" by the dozen; a good sprinkling of "tofts" and "holms," of "becks" and "steads," meet his eye as he scans the map, and present themselves in their actuality as he walks or rides about. Nor is it in the termination alone that this strangeness is seen. The first half of the names—the variable element, as we may call it—has also often something unusual in its look and sound. Hard sounds prevail over soft ones. Dentials and palatals take the place of labials and liquids. The harsh combination of "s" with a hard "c" or "k" or "t," as in Scawby, Skellingthorpe, Skirbeck, Stenigot, and the like—sometimes made harsher still by the addition of an "r," as Scremby, Scrivelsby, Strubby—is as frequent as to southern ears it is unpleasant. The Dorset Shillingstone becomes Skillington, the Somersetshire Shopwick appears as Scopwick. The southern "ch" stiffens into "c" and "k." Carlby takes the place of the Charltons (fifteen of which, as distinct parishes, may be counted south of the Thames), Cadwell of Chadwell, Kelfield of Chalfield, Killingham of Chillenden. "Church" as a formative is seldom or never found, either as prefix or an affix, "kirk" being its substitute. Instead of Churchham, Churchstoke, and Churchstow, we have in Lincolnshire Kirkby (six times over), Kirkton (smoothed into Kirton), and Kirkstead; while the compounds Basschurch, Dymchurch, Marychurch, and the like, are represented by such forms as Algarkirk and Peakirk. This difference in the character of the local names, it will be at once felt, cannot be accidental. It must indicate a corresponding difference in the tribes or peoples by whom these names were imposed. Names, we all know, were not given in old times as they too often are given now, out of mere whim or caprice, without the slightest regard to their suitability, so that a row of little ugly brick cottages by a dusty roadside is yclept "Paradise Place," and a batch of tenements, whose only view is over a hideous brickfield, is known as "Prospect Terrace," and "Abbeys" and "Priorys" and "Granges" are among the common stock of the builder's nomenclature. Anciently every local name had a meaning, and was given by those who knew that meaning, and because of it. It is not always—perhaps not often—possible for us, at this distance of time, and with the alteration and mutilation to which our local names have been subjected in the mouths of so many generations, to determine this meaning. It is often guess-work with the best-equipped philologists. But, difficult as the problem is, we are sure it has a solution, and this solution is well worth any amount of trouble to discover. As archæology is the handmaid of history, so is philology the handmaid of archæology. A well-directed study of words and names is one of the most important helps in arriving at the knowledge of things. No ancient place or name is without a signification, and in these names a store of history lies couched, waiting to be brought to light by the science of comparative philology. In the words of Professor Earle, "when the duly-trained philological eye traverses the map of any district it can read at a glance the traces thereon left, and assign each name to the race that gave it birth." We shall therefore do well to enquire what country of Europe exhibits place-names of a similar character to those which distinguish our Lincolnshire local nomenclature. If successful in this search, we cannot be far wrong in assigning a common origin to both, and in drawing the conclusion that Lincolnshire was at one time occupied by settlers from that country.

Now the nearest land to Lincolnshire in an eastward direction is Denmark. Our thoughts are therefore at once directed to that country. We know that in the ninth and eleventh centuries England was subject to perpetual inroads from the inhabitants of that country, and that no part suffered more than Lincolnshire. And, if we examine a map of Denmark, or run our eye over a gazetteer or index of place-names in that country, the very elements most distinctive of Lincolnshire names will be found with the greatest frequency. "Bys" and "holms," "thorps" (often modernised into "throp") and "becks," "tofts" and "steads," are of constant occurrence. Names are continually met with, such as Aaby, Lyngby, Skibby; Bandholm, Oxholm, Draxholm; Ringsted, Idsted, Orsted; Olskirk, Nykirk (the New Church of the southern counties), which would be quite at home in Lincolnshire. The whole vocabulary has a familiar look. The conclusion is as irre-

sistible as it is obvious. Our local names are to a large extent Danish names transplanted. To unravel their meaning we must ask what they signify in their native tongue. It is as true of words and names as of persons—*Cælum non animum mutant qui trans mare currunt*.

Let us examine some of those of more frequent occurrence. "By," the most frequent of all, originally meant a dwelling or a single farm, and afterwards came to denote a village. It is sometimes added to a root, giving the position or character of the place, as "Dalby," the village in the dale; "Scawby," the village in the wood; "Risby," the beech tree village; "Kirby," or "Kirkby," the same as Kirton, the village where the church stands; but more usually affixed to the possessive case of a personal name, as "Ormesby," the village of Orm or Worm; "Grimsby" (the village of Grim, corresponding to Grimthorpe), Asgardby, Kettleby, &c. "Thorpe," the next in frequency, signifies a collection of houses, corresponding to the German "dorf," as Theddlethorpe, Saus-thorpe, sometimes standing by itself, as Thorpe-on-the-hill. "Toft," which we have in Bratoft, Fishtoft, Huttoft, signifies a homestead or enclosure, and is an indication of permanent colonisation. "Beck," a brook; "naes" or "ness," a promontory; "garth" (the same root as the English "yard"), an enclosure, or sted, standing-place, or settlement; "aey" or "ea," an island in the midst of water; "holm," an island of hard ground in the midst of a morass—are all Danish test words, occurring with more or less frequency in Lincolnshire. Riseholme, Sudbrookholm, Dunholme, and Mickleholm (the large island), tell of a time before the streamlets were confined within banks and made to flow in certain beds, and the district round was marsh, out of which the holms rose as islands. "Thwait," a characteristic Scandinavian word, signifying a forest clearing, does not occur among us. The "fleets" indicate creeks or arms of the sea, much the same as "wicks," or "viks," where the sea-rovers anchored their boats, and from which they took their name of vikings, or "creekers."

We have only to take an intelligent survey of the map of our county, bearing these test words in mind with their meanings, to realise the truth of Mr. Isaac Taylor's statement that "whole districts of Lincolnshire present in their local names overwhelming evidence of an almost exclusive Danish occupancy." No inconsiderable proportion of our villages and hamlets are proved by the same evidence to have been little Danish colonies, usually taking their distinctive appellations—the variable part, as I have called it—from the personal name of the original settler from Jutland or the Danish islands. I say "districts of Lincolnshire," for any one who will take the trouble of examining the map for that purpose will observe that the prevalence of Danish names is confined to particular localities, and that there are large parts of the county where they occur but seldom, or not at all. In South Lincolnshire, especially the eastern part, where we are now met (the title of my paper must be so far corrected), such traces of Danish occupation are scarcely to be found. The reason is evident. The whole of this district was in early times one vast morass, through which the Welland and the Nen and the Glen soaked their way to the Wash, and afforded no temptation to settlers. The whole district between the Foss Dyke Wash on the north and the Cross Keys Wash on the south, and bounded to the west by the Carr Dyke, is still thinly populated. Parishes are few and of vast extent, and, as a rule, have English names. The Suttons, Weston, Moulton, and Luton exhibit the Anglo-Saxon test word "ton," an enclosure; Spalding, Deeping, and Quadring, the patronymic "ing," marking the settlement of a tribe—the Spaldingas, Deepingas, Quadringas. Crowland speaks for itself. The terminative "fleet" in Surfleet, and Fleet itself, may be either Scandinavian (Norse "fliot," Danish "flod"), but is more usually regarded as Anglo-Saxon, "fleet." The word is familiar to us in Fleet Street, London, so called from the River Fleet, which ran where Farringdon Street now is—Purfleet, where the powder magazines just now are giving the inhabitants a very uneasy life—Northfleet, Southfleet, and the like. In all the meaning is the same, a small inlet, or estuary at a river's mouth. The only Danish names I have noticed in this district are Thurlby and Langtoft, between Bourn and Deeping. Ravenscleugh and Ravensbrook, between Holbeach and Sutton St. James, may indicate places where those "sons of misery and barbarism," as Lappen-berg styles the Danish invaders, set up their raven standard of devastation, "the war flag that was called the Raven." It may, however, be derived from being the haunt of the birds of that name, or from "Rafn," the Danish proper name. The same may be said of the Ravendales, near Grimsby. Ravensfleet, on the banks of the Trent, near Gainsborough, and Raventhorpe-in-Appleby may be more confidently referred to Danish settlement. The most suggestive name in this district is the little hamlet of Guthramcote, in Bourn. It would be very interesting if we could connect this name with the leader of the pirate host which in the ninth century swept England before them, from the Humber to the Thames, defeated by our own Alfred, the saviour of England from Danish rule, at Edington, in Wilts; but by the peace of Wedmni, in Somerset, left in possession as overlord of more than half the island, all within a line from London to Bedford, and from Bedford to Chester—the Danelagh, as it was called—the mighty Guthrum, or Athelstan, as he was named by his royal godfather, Alfred, on his baptism as in the Parrett at Aller. This, however

\* A paper by the Rev. E. Venables, read at the meeting of the Lincoln Archæological Society.

possible, is too uncertain to be dwelt upon. Guthrum or Gorm was one of the most common Danish names, and "Guthrum's cote" may more probably be so called from being the cottage home of an humble namesake of the Danish king. It may also be remarked that the terminative "cote" is rather Anglo-Saxon than Scandinavian. The "cotes" which are so abundant on the seaboard to the north and south of Grimsby—Great Coates, Little Coates, North Coates, Somercoates, &c.—indicate outlying stations on the rich pasture lands fringing the shore of the Humber and German Ocean.

To discover the chief areas of Danish occupation we must look northwards and westwards. We should expect to find evidence of them most abundant along the shores of the Humber and the Trent. These rivers were the highways along which these pirate fleets made their entrance into the country, and after the first period of devastation, the firing of homesteads, the slaughter of men, the capture of the women for slavery or shame, the children tossed on the pikes or sold in the market-place, Christian priests slain at the altar by the worshippers of Woden, the ruin of churches and the pillage of the sacred vessels, which is again and again recorded in such terrible words by the Anglo-Saxon chroniclers, it would be along the course of these streams, or in the rich valleys and uplands of their banks, that the first permanent settlements of the conquerors would be made. The map confirms this idea. The neighbourhood of Grimsby, according to Dr. Latham, "the oldest and most thoroughly Danish town" we have, presents a remarkable number of Scandinavian place names; almost every parish is distinctly Danish—Keelby, Aylesby, Irby, Barnetby, Beelsby, Hawerby, Thoresby, Audby, Grainsby, Ormsby, Fotherby, Brocklesby, Riby, Ulceby, Utterby, Killingholme, Wragholm, Conisholme, Scupholme, Cleethorpe, Grainthorpe; Scartho, Thurnscoe, Ravendale, all mark the fixed residence of a Danish population greatly in excess of Saxon, or, as it is now the fashion to call them, English occupiers. Taking a district nowhere more than ten miles from Grimsby, we find of forty-six village names, twenty-eight Danish, fourteen Saxon, and four doubtful. Continuing along the Humber westwards, we come upon a remarkable group of Danish names at the mouth of the Trent. The eastern horn of the embouchure into the Humber is Trent Ness, a well-known Scandinavian root, meaning a nose or projecting bit of land, familiar to us in the Naze, in Norway and Essex; found so far north as Caithness, and as far south as Cape Grinez, near Calais; and appearing at intervals along our Lincolnshire coast, at Chowder Ness, Skitter Ness, and Clee Ness; and always marking the course of these Scandinavian sea-rovers. Towards the extremity of the high ground to the east of the Trent, that oolitic range running all through the county from Grantham, by Ancaster and Lincoln to the Humber, there is quite a remarkable little string of Danish names, chiefly with the termination "by"—Coleby, Thealby, Normanby, Risby, Appleby, Roxby, Conisby, Brumby, Ashby, Manby, Scawby; to which we may add Scunthorpe, Bishophthorp, Raventhorp, and Sandhoe. Crossing the Aneholme valley, the crest of the Wolds presents us with Ferriby, Saxby, Worlabby, Wrawby, succeeding one another like beads on a string. On the other side of the Trent, the Isle of Axholme exhibits but few Danish names. There are several "thorps"—Althorp, Derrythorp, Gunthorp; but only one "by," Keadby.

The history of the designation of the Isle of Axholme, or, in its full form, Axeyholm, is too curious to be altogether passed over, though leading us a little away from our special subject. It is an admirable example of what may be called stratification in local nomenclature. As geological strata exhibit the successive formations which have gone to make up the earth's crust at that particular spot, so a compound name may indicate, by the reduplication of synonyms, the various races that, one after another, have occupied the district. In this name we have Celtic, Saxon, Danish, and Norman elements. The syllable "Ax," the old British root for water—which appears, with all the vowels of the alphabet, in the Exe, Isca, Oxford, Usk (we all know the Irish "usquebaugh," the water of life, *aqua vitæ*), was given by the Celtic inhabitants to the vast mere or lake which then covered the whole district. The Saxons planted a settlement on the hard ground rising out of the swamp and named it Ax-Eye, or island in the water. The name is still preserved in the village of Haxey. The Danish freebooters moored their keels in the creeks, and ejected the Saxon inhabitants, and, adding their own "holm," called it Axeyholm. Finally, the Normans, as ignorant of the meaning of "holm" as the Danes were of "Eye," prefixed their own "Isle," and the district became the Isle of Axeyholme, or Axelholme, synonyms of island thus actually occurring three times over in different forms.

But to return to purely Danish names, at the risk of taxing the patience of my hearers, I must refer to two even more remarkable groups in our county, the one near Horncastle and the other near Sleaford. Of the former, embracing the southern extension of the Wolds, Mr. Isaac Taylor writes:—"A district, about nine miles by twelve, between Tattershall, New Bolingbroke, Horncastle, and Spilsby, would appear to have been more exclusively Danish than any other in the kingdom. In this small space there are some forty unmistakable Danish village names, such as Kirby, Moorby,

Enderby, Wilksby, Claxby, Miningsby, Hagnaby, Dalderby, Scrivelsby, Hareby, Lusby, Revesby, Raithby, Somersby, Salmondby, Fulletby, Ashby, Asgardby, Hemingby, Toft." I may supplement the list with Winceby, Scremby, Driby, Ormesby, Swaby, Gunby, Thoresby, Rigsby, Ulceby, Saucethorpe. Could we have more convincing evidence of the almost exclusive occupation of the Southern Wolds by Danish settlers than this overwhelming preponderance of Danish village names? An examination of the names of the district round Sleaford, with its Aunsby and Dembleby, Rauceby and Culverthorpe—would lead to the same conclusion; but to enumerate them would be tedious. Any who care to pursue the investigation can do it for themselves.

I would draw my paper to a conclusion by a rough but fairly trustworthy estimate of the proportion of Danish villages in Lincolnshire. Taking the "Diocesan Calendar" as my guide, I find 666 separate villages or chapelries named. Of these no fewer than 172, more than one-quarter, end in the distinctive Danish termination "by," 43 end in "thorp," 9 in "holm," and 4 in "toft;" the alphabetical index to "White's Gazetteer," which embraces hamlets and even separate farms, more than doubles the number of separate names, bringing it up to 1,300. This number includes 243 "bys," 34 "thorps," 18 "holms," and 14 "tofts," besides sundry "becks," "steads," "wicks," and "hoes." This raises the total sum of Danish place names in Lincolnshire to rather more than three hundred, the number given by Mr. Isaac Taylor, and, according to him, exceeding that to be found in all the rest of England put together south of the Humber. Leicestershire holds the second place with 66 "bys" and 19 "thorps;" Northamptonshire next with 26 "bys" and 23 "thorps;" Nottinghamshire gives 15 "bys" and 20 "thorps." All these countries formed part of the Danelagh, and were subject to the confederation of the five burghs—Lincoln, Leicester, Stamford, Derby, and Nottingham. Even to the north of the Humber no county approaches our own in this respect. Yorkshire, with its immense area, according to Worsae, supplies only 167 "bys," of which 100 are in the North Riding, Cumberland, and Westmoreland, after the Danelagh, the chief seats of Scandinavian colonisation, furnish respectively 43 and 20 "bys." The large county of Lancashire only 9.

The contrast between the county of Lincoln and other counties in respect of Danish occupancy, as proved by this test, is very remarkable. Essex supplies only two "bys," Suffolk three, and Kent, Buckinghamshire, and Huntingdonshire one apiece. The reason of this difference is plain. Too well and too fatally known in both quarters of England—to the one the Danish rovers came as pirates only, in the other they settled down as inhabitants; and it is habitation that gives names to places. The marked events of history are comparatively powerless in this respect. The substitution of Battle for Senlæ is an exception that proves the rule. The landings of the piratical Northmen in Kent and Sussex, in Dorset and Somerset, and their inroads into the interior, left no trace on the local nomenclature because the marauders themselves disappeared. They landed, they harried the country, they swept off their booty, returned to their ships, and sailed away with the spoil. With us in Lincolnshire, Danish piracy was followed by Danish settlement. The district ceded by Alfred to secure the peaceable possession of the rest of his long sorely-afflicted country—the oft named Danelagh—became purely Danish. The entries in the Anglo-Saxon chronicle, brief but momentous, tell how the ceded territory was parcelled out among the victorious occupants. The place names show the systematic manner in which this division was carried out. Our own wapentakes, nearly all of which bear Danish names, are the military divisions of the Danish leaders, so called either from "taking" up the weapons of war, or, more probably, from the pains displayed in "teaching" the youth the use of them. We have seen how frequent—how almost universal—is the termination "by," the building or tenement, and, as Mr. Freeman has remarked, in a vast number of cases the name of the Danish lord to whom it was assigned in the occupation of the ninth century. Such names as Candlesby, Grimsby, and Ormsby tell their own story. They speak of a conquered land, dealt out by the chieftains to their followers in portions, small or large, according to their claims and their power of making these claims good. Each of the new owners called the lands by his own name, and thus secured for himself a deathless memory. Their deeds, their persons, their characters are forgotten, but their names will remain stamped in the soil as long as England lasts. They did their part in the making of England, and their work remains, and we are the better, the nobler, the happier for it. To conclude with the words of Mr. Kington Oliphant, "English freedom was in the end the gainer by the fresh blood that now flowed in. When Domesday Book was compiled, no shire could vie with that of Lincoln in the thousands of its freeholders. Danish surnames, like Anderson—a name respected and beloved by us in this county, and more especially by the members of its Architectural Society—Paterson, and, greater than all, Nelson, show the good blood that our northern and eastern shires can boast," and which would have been of feeble strain but for the infusion of that which has flowed down to us through the veins of our Danish forefathers, and now to be

renewed in the race of our future sovereigns, the children of the

Sea kings' daughter from over the sea,  
Blissful bride of a blissful heir,  
Bride of the heir of the kings of the sea—  
Alexandra."

### FIRE RISKS FROM ELECTRIC LIGHTING.

THE following rules and regulations for the prevention of fire risks arising from electric lighting have been recommended by the Council of the Society of Telegraph Engineers and of Electricians, in accordance with the report of the committee appointed by them on May 11, 1882, to consider the subject:—

The members of the committee were:—Professor W. G. Adams, F.R.S., vice-president; Sir Charles T. Bright, T. Russell Cramp-ton, R. E. Crompton, W. Crookes, F.R.S., Warren De la Rue, D.C.L., F.R.S., Professor G. C. Foster, F.R.S., past-president; Edward Graves, J. E. H. Gordon, Dr. J. Hopkinson, F.R.S., Professor D. E. Hughes, F.R.S., vice-president; W. H. Preece, F.R.S., past-president; Alexander Siemens, C. E. Spagnoletti, vice-president; James N. Shoolbred, Augustus Stroh, Sir Wm. Thompson, F.R.S., past-president; Lieutenant-Colonel C. E. Webber, R.E., president.

These rules and regulations are drawn up not only for the guidance and instruction of those who have electric-lighting apparatus installed on their premises, but for the reduction to a minimum of those risks of fire which are inherent to every system of artificial illumination. The chief dangers of every new application of electricity arise mainly from ignorance and inexperience on the part of those who supply and fit up the requisite plant. The difficulties that beset the electrical engineer are chiefly internal and invisible, and they can only be effectually guarded against by "testing" or probing with electric currents. They depend chiefly on leakage, undue resistance in the conductor, and bad joints, which lead to waste of energy and the production of heat. These defects can only be detected by measuring, by means of special apparatus, the currents that are, either ordinarily or for the purpose of testing, passed through the circuit. Bare or exposed conductors should always be within visual inspection, since the accidental falling on to or the thoughtless placing of other conducting bodies upon such conductors might lead to "short circuiting," or the sudden generation of heat due to a powerful current of electricity in conductors too small to carry it. It cannot be too strongly urged that among the chief enemies to be guarded against are the presence of moisture and the use of "earth" as part of the circuit. Moisture leads to loss of current and to the destruction of the conductor by electrolytic corrosion; and the injudicious use of "earth" as a part of the circuit tends to magnify every other source of difficulty and danger. The chief element of safety is the employment of skilled and experienced electricians to supervise the work.

#### I. THE DYNAMO MACHINE.

1. The dynamo machine should be fixed in a dry place.
2. It should not be exposed to dust or flyings.
3. It should be kept perfectly clean, and its bearings well oiled.
4. The insulation of its coils and conductors should be perfect.
5. It is better, when practicable, to fix it on an insulating bed.
6. All conductors in the dynamo room should be firmly supported, well insulated, conveniently arranged for inspection, and marked or numbered.

#### II. THE WIRES.

7. Every switch or commutator used for turning the current on or off should be constructed so that when it is moved and left to itself it cannot permit of a permanent arc or of heating; and its stand should be made of slate, stoneware, or some other incombustible substance.
  8. There should be in connection with the main circuit a safety fuse, constructed of easily fusible metal which would be melted if the current attain any undue magnitude, and would thus cause the circuit to be broken.
  9. Every part of the circuit should be so determined that the gauge of wire to be used is properly proportioned to the currents it will have to carry; and changes of circuit, from a larger to a smaller conductor, should be sufficiently protected with suitable safety fuses, so that no portion of the conductor should ever be allowed to attain a temperature exceeding 150 deg. F.
- N.B.—These fuses are of the very essence of safety. They should always be enclosed in incombustible cases. Even if wires become perceptibly warmed by the ordinary current, it is a proof that they are too small for the work they have to do, and that they ought to be replaced by larger wires.
10. Under ordinary circumstances complete metallic circuits should be used, and the employment of gas or water-pipes as conductors for the purpose of completing the circuit should in no case be allowed.
  11. Where bare wire out of doors rests on insulating supports it should be coated with insulating material, such as indiarubber, tape, or tube, for at least 2 feet on each side of the support.

12. Bare wires passing over the tops of houses should never be less than 7 feet clear of any part of the roof, and they should invariably be high enough, when crossing thoroughfares, to allow fire-escapes to pass under them.

13. It is most essential that the joints should be electrically and mechanically perfect. One of the best joints is that which is whipped round with small wire and the whole mechanically united by solder.

14. The position of wires when underground should be efficiently indicated, and they should be laid down so as to be easily inspected and repaired.

15. All wires used for indoor purposes should be efficiently insulated.

16. When these wires pass through roofs, floors, walls, or partitions, or where they cross or are liable to touch metallic masses like iron girders or pipes, they should be thoroughly protected from abrasion with each other or with the metallic masses, by suitable additional covering; and where they are liable to abrasion from any cause or to the depredations of rats or mice, they should be efficiently encased in some hard material.

17. Where wires are put out of sight, as beneath flooring, they should be thoroughly protected from mechanical injury, and their position should be indicated.

N.B.—The value of frequently testing the wires cannot be too strongly urged. It is an operation, skill in which is easily acquired and applied. The escape of electricity cannot be detected by the sense of smell as can gas, but it can be detected by apparatus far more certain and delicate. Leakage not only means waste, but in the presence of moisture it means destruction of the conductor and its insulating covering by electric action.

#### III. LAMPS.

18. Arc lamps should always be guarded by proper lanterns to prevent danger from falling incandescent pieces of carbon, and from ascending sparks. Their globes should be protected with wire netting.

19. The lanterns and all parts which are to be handled should be insulated from the circuit.

#### IV. DANGER TO PERSON.

20. To secure persons from danger inside buildings, it is essential so to arrange the conductors and fittings that no one can be exposed to the shocks of alternating currents exceeding 60 volts; and that there should never be a difference of potential of more than 200 volts between any two points in the same room.

21. If the difference of potential within any house exceeds 200 volts, whether the source of electricity be external or internal, the house should be provided outside with a "switch," so arranged that the supply of electricity can be at once cut off.

By order of the Council.

F. H. WEBB, Secretary.

### THE ORIGIN OF ENGLISH ART SCHOOLS.

A LETTER has appeared in the *Staffordshire Advertiser* from Mr. George Statham on the origin of schools of art. He writes:—Early in life I had special opportunities for noting the influences which led to their establishment, and also of knowing and observing the labours of the pioneers in the movement that led to the action of Parliament and then of the Government. I feel, therefore, confidence in sending you the sum of my own reminiscences relating to the subject, which will show a difference respecting the origin of the school of art in England from that given by the hon. member for Lichfield at a recent meeting in that city. As in most other things now established, schools of art are the result of a process of many years. Soon after the subjugation of Napoleon, peaceful industry revived on the Continent, and, especially from France, our manufactures were subject to a competition they had been almost free from during the war, and the inferiority of our own in art and taste began to be very sensibly felt. Napoleon's acts in other directions than those which had roused and alarmed the world began to be noted and appreciated. "You have beaten him in the field," said Brougham; "try and rival him in the more important arts of peace." For several years Haydon took up the same theme, and worked at it with an enthusiasm which with some was accounted fanaticism. When the London University in Gower Street was being established he wrote to the projectors urging the teaching of art as of prime importance, offering to give his own services; but, as I heard him say in one of his lectures, "Shee said I was mad, and I was told it was not in the plan." Sir Martin A. Shee was then president of the Royal Academy. Haydon persistently importuned men of influence and leading members of the Government. "Do you think the people of England can ever be what you desire?" was the reply once of the Duke of Wellington. Haydon's answer was, "Yes, if you will give them equal facilities and similar schools to those on the Continent." In some directions the voice of Haydon was as "one crying in the wilderness," but in others a kindred

spirit was excited, which led, after a number of years of steady and patient effort, to the appointment of a Committee of the House of Commons, on the motion of Joseph Hume. Before that committee, Haydon, Martin, Reinagle, and Geo. Foggo, an eminent engraver, gave evidence, and also several foreigners, among them Dr. Waagen, M. Van de Weyer, the Belgian Ambassador, and others of note, from whom information respecting art schools on the Continent was gathered. The report of the committee was followed by the action of the Government, a Parliamentary grant was voted, and a school was started at Somerset House. It was at the close of the reign of King William that Parliamentary action was taken, and in the first years of that of the Queen that the arrangements were matured which resulted in the establishment of the school at Somerset House. This school was in full operation prior to the marriage of the Queen with Prince Albert, and influences were at work for starting schools in the provinces. If any names are held up for chief honour and remembrances in connection with the origin of schools of art the names of Haydon and Foggo will stand foremost; the former by his self-sacrificing enthusiasm in creating public opinion, and the latter by his steady, persistent endeavours which brought that opinion to a focus leading to effective action. As well as frequently hearing Haydon lecture, I heard Foggo also, and oftener, and his lectures were always illustrated with all kinds of manufactures—fictile, textile, metallic, &c. I vividly recollect his bringing the report of the Parliamentary committee I have mentioned to the London Mechanics' Institution and presenting it to the president, after quoting a newspaper article in which the whole movement was attacked, and Haydon, and Hume, and Ewart were ridiculed, and he himself was spoken of as "the foggy-headed individual before mentioned!" While I am disputing the "Royal" origin of schools of art, I may mention one fact which shows that the Queen's mother took great interest in the movement, and when Hume had succeeded in getting his motion for a committee passed she wrote to him congratulating him on his success. My brother-in-law was secretary to Hume at the time, and from him I heard of it directly afterwards. The Queen's mother was also the first to send money to Haydon when he was sent to Queen's Bench for debt. This occurred during a course of lectures I was attending, some of which had to be postponed in consequence. Of her sympathy he very feelingly spoke in the first lecture after.

## VENTILATION OF SEWERS.

A REPORT has been prepared by Sir Joseph Bazalgette, C.B., C.E., on the Sewerage of Brighton. It is preceded by the following retrospect of the results of some of the methods which have from time to time been suggested and tried for the better ventilation of the sewers of towns:—

The removal or treatment of the gases resulting from decomposition in sewers in an inoffensive manner is a subject which during the last half-century has received much consideration. When in 1850 I was conducting experiments on the ventilation of the sewers of London, I had the advantage of consulting with that eminent chemist, Professor Faraday, who had previously given much attention to the subject, and who, in his evidence before a Parliamentary Committee as early as 1834, had expressed the opinion that it was beset with great difficulties. Subsequently I visited some of the mines in the north of England and in Wales, in order to see how far any of the modes adopted for their ventilation could be applied to the better ventilation of sewers, and I became acquainted with most of the suggestions which have been made for otherwise dealing with the gases generated in sewers.

In 1858 a Committee of the House of Commons, consisting of Lord Palmerston, Lord John Russell, Lord John Manners, Sir Benjamin Hall, Mr. Robert Stephenson, and Mr. Tite, directed me to make experiments on the effect produced by extracting and burning the gases of sewers by means of furnaces. Those experiments were conducted with the furnace in the clock-tower of the Houses of Parliament, and I subsequently gave evidence before that Committee, to the effect that in the immediate neighbourhood of the furnace the indraught was found to be very strong, but that, whilst the supply of air was drawn with great force from the sewer inlets close to the furnace, the air current produced in the sewers at a short distance from the furnace was scarcely perceptible. The Committee of the House of Commons reported that, although such a process might be advantageous to sewers within a short distance of the furnace, it could not be successfully applied to any wide range of sewers, on account of the number of openings which unavoidably communicate with them, the nearest of which to the furnace would supply it with atmospheric air, whilst the gases in the further part of the sewers and house-drains would remain unaffected by its action.

In a mine there is but one downcast and one upcast shaft, and all the air brought into the mind at the downcast shaft can be directed and conducted at will, and discharged at the upcast shaft after it has passed through the whole length of the various galleries; whereas, in an ordinary system of town sewers, provided with inlets for the admission of water at every house-drain, gully,

and branch sewer connection, the beneficial effect of furnaces, fans, or air pumps, becomes limited to a comparatively small area; but wherever furnaces exist in the neighbourhood of sewers, it is nevertheless desirable to connect them with the sewers. In long lines of intercepting and outfall sewers, which have no branch connections or openings along their route, furnaces have been and may be used with the same beneficial results as in mines.

In 1866 Dr. Miller, F.R.S., and I conducted a series of careful experiments on the effect of ventilating sewers through charcoal, which extended over a period of twelve months and embraced a large drainage area. The sewers were cut off from all other means of ventilation, except through charcoal trays of various forms, fixed in the ventilators. We found that whilst dry charcoal is an efficient means of deodorising and disinfecting sewage gases, its introduction into the ventilators produced a sensible retardation of the current of air in the sewers, and the carbonic acid in them was increased on an average of our experiments from 106 to 132 per cent., and the mean temperature in the sewers was thereby raised from 50.8° to 56.2°. The beneficial effect of charcoal is, moreover, considerably reduced by moisture, and it therefore requires renewal at no very distant periods, varying according to the state of the atmosphere. Charcoal may be introduced with advantage into such ventilators as are the cause of any special annoyance; but, as they retard the current of air, their number and area would, if generally adopted, have to be increased to an extent which is for many reasons undesirable.

Shafts connected with the sewers and carried through lamp-posts in the streets, or to the tops of adjoining buildings, away from the chimneys and upper windows, might in many cases be so constructed as to ventilate the sewers efficiently, provided they were sufficient in number and in the area of their openings. But there is frequently much difficulty in obtaining the necessary consent for ventilators up the sides of houses on account of their having to be placed on private property.

The use of sulphurous acid and chlorine gas placed in ventilating shafts, and various other chemical or mechanical antidotes, have been attended with more or less beneficial results, and most of them may, under favourable circumstances, be applied in particular places with advantage; but all these modes of treatment require such constant attention and frequent renewal that they thus become liable to failure.

In order to prevent the evolution of noxious gases from sewage, the great object to be attained is its dilution and rapid removal, before decomposition has set in, by a copious supply of water, through sewers having sufficient falls to prevent the accumulation of deposits in them. Where these conditions cannot otherwise be sufficiently secured, the sewers should be kept clean by periodical flushing. Road detritus, if allowed to enter and deposit in the sewers, will accumulate and precipitate with it much of the sewage which otherwise would not deposit. The efficient scavenging of the surface of the roads and the interception of the detritus washed off them during heavy rains by properly-formed catchpits, are therefore essential to the maintenance of clean sewers. Macadamised chalk, or gravel roads, especially those having steep inclinations, require particular attention in these respects. In 1878 there were in the metropolis 1,700 miles of roads, of which about 1,000 were macadam or gravel, and from the surface of the whole were removed in one year over 600,000 cubic yards of detritus, at a cost of about 1s. per yard; whilst about 100,000 yards were removed from catchpits under the gullies, at a cost of 2s. 6d. per yard, and 20,000 cubic yards were taken from the sewers at a cost of about 25s. per yard. Thus it will be seen that effective scavenging and the construction of proper catchpits are economical as well as being advantageous to the condition of the sewers.

There are few who will not now recognise that the removal of the refuse of large towns by water is so vastly superior to any other known method as to have caused it to be an essential in these days of civilisation and refinement. But the underground carriers must be freely ventilated or the gases generated in them will escape into the houses, where, being shut up and but slightly diluted with atmospheric air, they are inhaled day and night, and become injurious to health and dangerous. It will be found upon close investigation that in the great majority of cases where persons have suffered from the effect of sewer gases, the mischief has arisen from defective house drainage and not from the public sewers. Every house drain should be formed of stoneware pipes, laid with sufficient fall to prevent the accumulation of deposit, and ventilated from its upper end to the roof of the house, but very few are so ventilated.

The gases escaping from efficient sewers ventilated on to the surface of the roads may nevertheless, in certain states of the atmosphere, be offensive in the immediate neighbourhood of such ventilators, and although no universal system of ventilation has yet been discovered which can be always applied without any inconvenience, some satisfactory mode may in every case be selected, according to the varied conditions of the localities to which it has to be applied. Attention to the foregoing principles of construction and maintenance of the sewers will very materially promote their ventilation without offence or injury.

Seaside Houses.

SIR,—The arrangements of ordinary lodging and “company” houses in towns at the seaside are too well known to need much description. They do not differ much in the disposition of the various apartments from houses in inland towns, viz., a basement storey (frequently occupied), ground-floor, first floor, second floor, &c. Sometimes there are other floors and attics, which are calculated to give the maximum of sanitary evils with the minimum of comfort, health, economy of space, or service. The limited area of the site on which one of the houses is built (except in some newly laid-out towns) rarely admits of an open space except a small yard at the back. The yard is generally approached by a lane, which serves for a double row of yards, running between the line of dwellings, and forms a narrow gullet in which air teeming with mischievous influences from the yards and basement storeys stagnates before it is admitted into the window opening when the sashes are opened for ventilation. The basement, when occupied, generally consists of a kitchen, scullery, dustbin, and other offices productive of dirt and offensive smells. By means of the kitchen fire and its long line of heated flues upward to the roof, a rarified state of air is produced in the lower portion of the house, a quick ascending current and indraught from the air of the back yards are inevitable. The result must be a more or less tainted atmosphere within the dwelling. Moreover, in order to utilise as many apartments as possible for the visitors, the administrative staff of the house frequently are huddled together in all sorts of corners, weltering in heat and fumes necessarily produced by culinary and other operations carried on in a close, damp basement storey. In this way conditions unsuited to health are induced from top to bottom of a house, and, without taking into consideration the insufficient closet accommodation which is usually mixed up with the apartments, I think we may safely conclude that a considerable percentage of disease is yearly engendered in seaside lodgings and other so-called health resorts. It follows that many, instead of being recruited, return (as the writer has done) to their homes with impaired health.

In one of the newest and most ambitious seaside towns I was struck by the liberal extent of the space surrounding all the houses, which are mostly semi-detached or in groups of three dwellings. But in the houses it is not uncommon to find a water-closet about 4 feet square on the landing of basement stair, enclosed by a mere screen 7 feet high and 3 feet from kitchen door, into which by in-draught this place is sure to be ventilated. The desire of the proprietor to afford ample space is frustrated in consequence, for a house surrounded only by open country would be dangerous under similar circumstances.

Having thus pointed out some of the defects of places to which so many every year turn with the hope of gaining health, I shall now briefly offer a few suggestions which, I think, would convert these houses into healthy homes.

The kitchen and culinary department should be removed from the basement storey or ground floor. In cases where the site affords no alternative, a basement should be retained only so far as is required for communication from a front to back area, foot of servants’ stair service lift, luggage-room, and a place to store coals, roots, dry ashes, and closed receptacles for vegetable dressings for periodical removal by dust-carts, and other local arrangements for the purpose. The entire administrative department closets should form an annexe separated by an air-way from main buildings, with windows opening on each landing for thorough ventilation and light. The annexe should contain on the ground floor (of a moderate-sized house) a small apartment for those who wish to smoke or write letters, water-closet, lift, servants’ stair and airway, tradesmen’s entrance, and luggage-lobby, brush-room, &c. On first floor should be half-landing from main stair, housekeeper’s room, housekeeper’s general store-room, butler’s pantry, water-closet, lift, servants’ stair, and airway. On second floor half-landing, housekeeper’s bedroom, servants’ bedroom, bath-room, water-closet, lift, servants’ stair, and airway. On third floor half-landing, kitchen, scullery, larder, housemaids’ closet, lift, servants’ stair, and airway. The service lift to communicate with each floor, for luggage and persons, also for kitchen stuff, coals, &c.; and from kitchen to each floor, ventilated through roof. The back stair and lift being for the exclusive use of annexe, there would be no unnecessary passing of servants into the main building. The household operations would thus be carried on outside the apartments of the visitors, who would, in consequence, be free from disturbance, artificial heat or unhealthy exhalations from kitchens, heated flues, or back yards. With windows at back as well as front, a continuously equable, agreeable, and invigorating atmosphere would be maintained throughout the day and night. The administrative staff would be released from drudgery in semi-lighted rooms, malarious smells, and damp, and placed in the free light and air at the top of the house. There would be free vent

for the escape of offensive emanations in the upper atmosphere above the roofs. As the stores required for kitchen use keep best in a dry, pure atmosphere, there would be less waste and decay, and consequent taint, in the larder, which would be placed only a few steps away from the operations of the cook. The house-keeper’s and servants’ bedrooms would be near their work; and the housekeeper’s room and dry store-room adjoining openings from lift and servants’ stair, would give a general control of all the operations of the administrative department and service of visitors’ rooms. By the concentration of offices economy of labour would be insured, and the wear and tear in carpets, dress, and furniture minimised.

For gentlemen visitors wishing to smoke, write and despatch letters, a small room in the annexe on the ground-floor is provided, with the necessary means of carrying up fumes to the roof, and thereby avoiding the nuisance to other visitors.

The structural arrangements of the house should, as far as possible, correspond with the requirements of time and place, such as overhanging roofs for protection from the heat-rays of the sun, damp, and cold; balconies sheltering under roofs, protected verandahs, &c.

In decoration and fitting up honesty of purpose should be the ruling principle, and sanitary considerations, such as light and cheerful tints in walls, floors, and furniture, bear priority in selection. A well-fixed colouring matter for ordinary walls, filling up the pores of the plaster so as to prevent gaseous absorption capable of carrying any tint such as recently introduced, might be applied decoratively in structural or art forms to meet the taste of the most fastidious, avoiding the sanitary objections raised to wall papers in general.

For all structural woodwork (whether framed in varying natural tints or plain wood) good varnish should be used, as some surface-tints absorb much light and others less; some reflect or increase light in the room, both in walls, furniture and floors. The choice should be for the least absorbent, whilst, by the opposite treatment, however æsthetic and in good taste, the same apartment may become dismal and depressing to invalids.

In conclusion, no considerations should, whatever class of house be erected, interfere with the reasonable principles of arrangement and construction such as I have endeavoured imperfectly to point out, the results of which I am sanguine would be that each house so treated would be in fact a convalescent home full of hope for all who seek health therein, and free from the “Spectre of Death” in the lodgings.

I am your obedient servant,

Lytham, Lancaster. F. S. SMITH, Architect.

**Memorial Hospital, Eastbourne.**—The foundation-stone of this building was laid on the 5th inst. by Princess Christian. The hospital, which will be of the Queen Anne style of architecture, will consist of three blocks connected by corridors. On the ground floor of the central block will be surgery and operating-rooms, the housekeeper’s room, hall, kitchen, scullery, porter’s room, larder, and pantry. At the rear will be a large yard with the usual offices, and on the first floor of this portion of the building there will be bedrooms for the nurses. The wings on either side will contain respectively the men’s and women’s wards, the accommodation provided in each being six beds. These wings, which will consist of only the ground floor, will be capable of extension should necessity arise. The entire length of the building will be 164 feet, and its width 82 feet. It is contemplated that the hospital, the contractor for which is Mr. W. Gregar, of Stratford, will be completed, in March next. The architect is Mr. T. W. Cutler, Queen’s Square, Bloomsbury. The site, which is about an acre in extent, was given by Mr. C. Davies Gilbert. The building will cost about 5,000*l.*

### CHURCH BUILDINGS AND RESTORATION.

**Lincoln.**—The Church of St. Mary Magdalene has been re-opened after undergoing restoration, which has been carried out under the direction of Mr. G. F. Bodley, A.R.A. A new vestry, with organ-loft over, has been provided on the north side, and tower and belfry at the north-west. The floors have been renewed and tiles laid in the aisles. The chancel floor has been laid with Hopton wood, stone and slate. The contractors for the work were Messrs. Martin & Sims, of Lincoln.

**Leeds.**—The memorial-stones of a new Wesleyan chapel, Crossgates, have been laid. The chapel, which will cost about 800*l.*, is being erected from the designs of Mr. G. F. Danby, architect, of Leeds, the style adopted being Gothic. The structure will be erected of pressed bricks, with stone dressings. The roof will be open-timbered; the whole of the interior woodwork of pitch pine, varnished. The works are being carried out by Messrs. Marshall & Sons, of Crossgates, and Messrs. Tomlinson, of Leeds.

**Bucknall.**—The old parish church of Bucknall, between Bardney and Horncastle, has been reopened. A considerable amount of rebuilding has been necessitated by the ruinous condition of the structure. The contractors for the works were Messrs. Walter & Hensman, of Horncastle.

**Fownhope.**—The church of St. Mary, Fownhope, has been re-opened after works of renovation, carried out under the direction of Mr. Thomas Nicholson, Diocesan architect, Hereford. The contractors for the work were Messrs. Stone Brothers, of Fownhope. Among the works, the plaster and colouring have been removed, and the masonry exposed and pointed; the floor of the nave and aisle has been lowered, the roof renewed and the pews replaced by handsome open pitch-pine seats. The seats are placed on new blocks; the flooring in the church paved with Godwin's encaustic tiles in the chancel, and mixed encaustic tiles in the nave.

### NEW BUILDINGS.

**Carriage Works, Marsden.**—The second contract for the new works for the Metropolitan Railway Company is approaching completion. There are four buildings—viz., permanent way shop, 325 feet long, 50 feet wide, 25 feet high; builders' workshop, 282 feet by 50 feet by 35 feet; locomotive shops, 260 feet by 198 feet by 35 feet; engineer's offices, 100 feet by 46 feet by 35 feet. The first brick was laid on January 25, 1882. Nearly three millions of bricks have been laid up to the present. The total cost will be about 60,000*l.* The bricks were supplied by Mr. H. Odell; the ironwork by Messrs. Stanley, Hall & Co.; lime by Messrs. Greaves, Bull & Lakin; and stone by the Howley Park Stone Company. The general contractors are Messrs. B. N. Smith & Sons, of Birmingham.

**Cork.**—The foundation-stone of a new home for the aged was laid by the Right Rev. Dr. Delaney, Lord Bishop of Cork, on July 2. The new building will be nearly 300 feet long, and will accommodate 250 old people. The cost will be about 16,000*l.* The architect is Mr. D. J. Coakley, A.R.I.B.A., 48 Grand Parade, Cork; and the builders, Messrs. E. & P. O. Flynn, Cork.

**Wolverhampton.**—The directors of the Wolverhampton and Staffordshire Banking Company have determined to enlarge their banking premises in Lich Gates by erecting another front, facing the new street, on a piece of land they have bought from the Corporation, and the work has been begun by Mr. H. Lovatt, contractor, Darlington Street, from the plans of Mr. T. H. Fleeming, architect, Waterloo Road, Wolverhampton. The elevation and style of the additions are to be in character with the present buildings, and the frontage will correspond with the one now facing St. Peter's Church.

### ARCHÆOLOGY.

**Discoveries in Gloucester.**—In the course of the excavations for the Co-operative Stores the following relics were dug up:—Copper coin: Anglesey mines halfpenny, 1788. A quantity of refuse, probably from glass melting-pot, of greenish-blue colour, much oxydised, with nodules of silica. Remnant of crucible in which silver has been melted; particles of silver embedded. A quantity of shards, dating probably from the fifteenth century. Fragments of encaustic tiles, ornamental and plain, dating from fourteenth and fifteenth centuries. Fragments of delf stoneware, quart pots, &c., of fine blue colour; initials A. R. (Queen Anne) and G. R. (Prince George of Denmark, her husband) existing on some fragments. Pint-pot, stoneware, upper part painted red, lower part enamelled; on enamelled part is, very spiritedly painted, a fox (in blue colour), with the legend, "We shall catch him anon." Portions of brown stoneware cups, quart and pint; the name of "Hodack" is stamped on one pint cup. Remains of glass Dutch flasks; one, tolerably perfect, bears a crest (a dog's head) stamped thereon; the oxydation on some fragments is very beautiful. Portion of terra-cotta dish, painted inside a beautiful light blue, with portion of (qy.) head of Charles I. in dark blue,

with yellow crown. The head has the characteristic long hair of Charles I. Freestone head of infant Christ, of thirteenth-century workmanship; the carving finished on one side only, the other side having evidently been against a Madonna; remains of gilding existing on hair. Old glass phial and glass bottle. Enriched classic moulding in white marble. Two ancient earthenware pots. These relics are in the possession of the architects, Messrs. Medland & Son, but will be offered to the County Museum.

### ART WORKMANSHIP.

**Church Decoration.**—Some special works of decoration have lately been carried out in the church of St. Columb, at Holywood, near Belfast. These works have been executed from the designs of Mr. W. T. Beane, of Great Marylebone Street, London. The style of decoration is a combination of Celtic and Mediæval ornament, the Celtic forming a prominent feature. The decoration in the chancel takes the form of a dado or arcade corresponding with the architectural style of the building, which is Romanesque. The spandrels and frieze of the dado are of purely Celtic ornament founded on examples of ancient Irish art as illustrated in Petrie's "Round Towers of Ireland." Above the dado the walls are covered with conventional arabesques of passion flowers, sprays and tendrils, on a groundwork of rich vellum tint. Around the chancel windows and under the carved stringcourse are inscriptions in Celtic characters. The panels of the ceiling are coloured a pale blue with gold stars. The high altar and reredos are of a rich cream colour. The reredos contains six panels, representing respectively the Blessed Virgin, the Four Evangelists, and St. Columbkille. The saint is depicted in a white habit and cowl; he holds the short Irish crozier, and at his feet is a bell emblematic of his office as abbot. The bell is designed from the original bronze bell of Cromgall, now in the possession of Captain McCance of Cliftonville. The decoration over the chancel arch represents the scenes of the Crucifixion, executed in outline on a diapered background harmonising well with the detailed ornament of the arch, which is Celtic.

**Reredos.**—A new reredos, designed by Mr. Bassett Smith, of the Adelphi, has been erected in the church at Great Bealings. It is composed of three panels divided by small buttresses and alabaster columns, moulded base and capitals, with tracery and crocket work, and pinnacles in relief. The panels are enriched with mosaic work. The style is Early Perpendicular. The carving is conventional.

### GENERAL.

**The Rev. J. C. Robertson**, the librarian of Canterbury Cathedral, died on Sunday last, in his seventieth year. He was a recognised authority on the history of the cathedral.

**Professor Legros** has presented his painting of *St. Jerome*, which was in the Royal Academy Exhibition last year, to the Manchester Institution.

**Mr. Jonathan Pratt**, Honorary Secretary of the Royal Birmingham Society of Artists, has been appointed Honorary Curator of the Birmingham Corporation Art Gallery in the place of the late Mr. Everitt.

**Mr. J. C. Traylen**, architect, of Peterborough, who has succeeded to the practice of the late Mr. Edward Browning, Stamford, has been appointed Diocesan Surveyor for the archdeaconry of Oakham.

**Mr. Banister Fletcher** has let an estate comprising rather more than four acres by tenders to Messrs. Smith & Goodman, and the Court of Chancery having approved the terms, the roads are being made and the houses built. This will add about 120 houses to the great number now being erected around London.

**The Birmingham School Board** have ordered 1,000 combination desks and seats from the Midland Joinery Company for the new schools in Icknield Street, Foundry Road, and Laxton Street. The architects are Messrs. Martin & Chamberlain.

**A Convention** of the American Institute of Architects will be held in Cincinnati on October 25.

**A Church** is about to be erected at Small Heath in memory of the late Dr. Oldknow, from the designs of Mr. A. E. Dempster, architect, of Temple Row, Birmingham.

**A New Building** of glass and iron is to be erected in Berlin on the site of one intended for the Hygiene Exhibition, which was recently destroyed by fire.

**Alterations and Additions** are being made to the Old Trafford Blind Asylum, Manchester. Mr. Charles Heathcote, Princess Street, Manchester, is the architect, and the works are let for 2,281*l.* to Messrs. Wilson, Toft & Huntley, contractors.

**The New Hospital** at Hope, for the Salford Union, is approaching completion. It was designed by Mr. L. Booth, F.R.I.B.A., and the contract amount is 43,480*l.* The wards and day-rooms are warmed and ventilated by means of the patent Manchester grates of Mr. E. H. Shorland, to which a silver medal was awarded at the recent Smoke Abatement Exhibition, South Kensington.

# The Architect.

## THE SMOKE ABATEMENT MOVEMENT.

UNDER the presidency of the Duke of WESTMINSTER, and at his Grace's residence, Grosvenor House, a meeting was held on the 14th instant which ought to have been of some practical importance, having indeed for its object nothing less ambitious than to awaken the interest of the influential classes in an organised enterprise for the abolition of our abominably intimate acquaintance the London fog. A "society" of the customary kind has been established to promote the purpose in view, under the modest name of "Smoke Abatement." Patronage of the highest social order has been obtained, as is evidenced by the demonstration at Grosvenor House. Scientific patronage of equal weight, so far as names go, has been also secured. An "exhibition" of the regulation order has been held, and medals have been awarded. The chief business of the assembly at the Duke of WESTMINSTER'S was the formal presentation of these medals by the gracious hand of Lady GROSVENOR. And if all this is very gratifying, and indeed highly promising, we have only to express the hope that the London atmosphere will speedily be cleansed—as, for a good example, the London river, once so nasty, has unquestionably been—and the infamously famous yellow fog relegated to the category of exploded superstitions. Our young people already can scarcely anyhow imagine how exceedingly unpleasant the habits of good old Father Thames used to be; and we begin to hope that the youth of the twentieth century, and possibly of the first half of it, may be in like manner unable to believe the representations of to-day respecting the melancholy conversion of honest metropolitan air into pea-soup.

Perhaps it is only because the enterprise before us, like all enterprises whatever, must begin at the beginning; but the fact is plain that the abolition of our atmospheric poisoning has as yet attained no farther than the encouragement of those manufacturers of stoves and furnaces who profess to deal with what is called smoke consumption, or more properly, perhaps, smoke prevention. The recipients of the medals last week were in fact precisely the same persons whose names have been advertised for so many years past as trade competitors for the supply of the market with grates and stoves and so forth "on improved principles." So forcibly would this circumstance strike the mind of a stranger, that it must have been difficult with many to resist the impression that no progress whatever is being made in any new direction. All "improved principles" in the trade of stove-making have for their object in one way or another the diminution of the waste of fuel; and as waste of fuel is always identified, rightly or wrongly, with the production of smoke, the general idea of the matter is that any new contrivance in the form of a stove must necessarily have for its object the philanthropic endeavour to make less smoke, and probably to "consume" or burn up in some way, as it it were in fact floating fuel, whatever smoke may in spite of the contrivance be still produced. Accordingly, as we have hinted, the problem how to dispose of the London fog is for the present confounded with the invention of improved stoves.

But we submit that such a view of the question is one that cannot long keep its hold upon the public mind. True, there is a vast deal of smoke sent up into the air from our chimneys, and not in London alone. The use of raw pit-coal for fuel in the delicately-appointed rooms of elegant and fastidious people seems on the face of it to be a gross vulgarity in science, a barbarous anachronism, a piece of domestic conservatism scarcely to be accounted for by men of cultivated understanding. Even amongst the poor, as a mere point of economy, the practice looks very like a reckless blunder; one of the many little blunders which the poor have not time to attend to. None the less, when we see factory chimneys belching forth enormous volumes of thick black Stygian soot, does it seem as if, in the hurry-scurry of his day's work, the very engineer himself were behind the age a couple of hundred years or so. We are fully disposed, therefore, to give all

honour to the ingenuity which seeks to ameliorate so backward a state of things. Still, what we venture to propose is that the matter in hand should be carried farther than this, and a good deal farther, and on a different line of thought altogether.

Ingenious stoves and grates, non-producers of smoke, consumers of smoke, and so forth, are, to say the least, obviously not for the many—the many who make the smoke. In other words, if the upper ten or twenty thousand who can afford the money to buy such scientific instruments, who can keep the servants to look after them, and who can pay the ironmonger's bills for their repair, had their chimneys all told and their smoke all measured, the aggregate would be but in proportion small, even if the least "improved" apparatus were universal. The thick yellow darkness of the atmosphere in London and some other great towns is not found to be generated in the fashionable neighbourhoods, but in the humbler districts where the bulk of the community is collected in confined quarters and amidst numberless elements of smoke production peculiar to the localities. How, then, are the many clever varieties of apparatus in question to solve the problem of smoke abatement with any practical efficiency? Grant that all round London just now the stoves and ranges of even the speculating builder are better than they used to be, and grant to the full the improvement thereby creeping into operation, is it not still to be said, not only that the movement is exceedingly slow, but that the effect is only local, and indeed chiefly temporary? What is wanted appears to be—and the notion is by no means a new one—some mode of dealing with the old apparatus, rather than the mere contrivance of new. This, we say, is not in any way a novel proposition; it has been before the public for many years; and yet nothing at all seems to be doing to meet the case in any form or degree.

Of course there will be those who explain such a circumstance by observing shrewdly that the profit accruing to the inventors and manufacturers of simple appliances to be attached to old grates for the avoidance of smoke would be all too small for their trouble; but we prefer to challenge the skill of the inventor, and not the liberality of the trader. Take the case of a recent notification issued by a professedly patriotic gas company, to the effect that they are prepared to supply at a rental, for the use of private houses, certain stoves and grates which operate by means of gas in place of coal. Of what service is this to the smoke-producing public? We cordially agree that gas-heating and gas-cooking *ought to be* cheaper as well as more cleanly than coal-heating and coal-cooking; but are they so? And if they were only no dearer, how is a householder to be persuaded to throw aside his stoves and range and pay a remunerative rent for others? The fact unquestionably is that the gas companies, if they would do their duty as monopolists towards a long-suffering and indeed not a little scandalised public, could quite easily avail themselves of the resources of science in such a way as, in the first place, to apply gas to every old grate and kitchen range in London; in the second place, to reduce their own charges almost to half the existing rates; and thirdly, to economise the consumption so that the cost of raw coal shall be unrecognisable in the altered account. As an illustration of what the resources of gas-engineering are, we may be permitted to repeat the story that is told of the reason why on certain occasions our gas-flames are so yellow instead of so white, while the more yellow they are the more persistently do they "roar." The story runs thus—we hope it is a wicked story—that when the supply of gas in stock happens to run short, the remedy is to let in a quantity of atmospheric air to make up the deficiency, and then to put on a greater pressure in order to overcome a natural and praiseworthy reluctance to move on which the adulterated fluid manifests in such circumstances; so that the public are enabled to consume at once the inferior quality and the greater quantity. We will only say, if ingenuity can operate so successfully in one direction, why not in another?

The London fog, we need scarcely repeat in this journal, is not caused by smoke alone. That which makes the throat and eyes smart as they lamentably do is in almost a greater degree the *town sweat*, not omitting the venomous vapours of sulphuric acid, nitric acid, ammonia, and other ungenial chemicals, which are the necessary concomitants of town life and trade. But the abatement of smoke, if it could be attained in an adequate degree, would doubtless go a great way, not only in the amelioration of the distressing state of things which prevails every winter in London, but, what is of equal im-

portance, in the cleansing of the very summer air. Let us press the question, however, whether the invention of new stoves is enough; indeed, whether it is of any practical effect at all. We feel that we can scarcely be wrong in calling upon the world of inventors to try an entirely different line of inquiry: we do so with all respect, but with all earnestness. We do so, let us add, with all confidence.

### ANCIENT CHARGES AGAINST PHEIDIAS.

ON the last occasion of his distributing the prizes to the students of the Royal Academy, Sir FREDERICK LEIGHTON chose as the subject of his address the question whether a strict moral sense is a necessary part of the character of every artist; or, as he put it, the problem of the relation of art to ethics. His own opinion was that "whilst art is indeed in its own nature wholly independent of morality, and whilst the loftiest moral purport can add no jot or tittle to the merits of a work of art as such, there is, nevertheless, no error deeper or more deadly . . . than to deny that the moral complexion, the ethos, of the artist does in truth tinge every work of his hand, and fashion in silence, but with the certainty of fate, the course and current of his whole career." Or again, "We have seen that whilst the inculcation of moral and religious truth must be admitted not to be the object of art as such, nor moral edification its appointed task, it is not therefore true, as some would have us believe, that the artist's work is uninfluenced by his moral tone, but rather that the influence of that tone is, in fact, upon it and controls it from the first touch of the hand or chisel to the last." Unfortunately the records of the lives of artists sometimes present a very different side to the question, even in cases where the true greatness of the artist is beyond all manner of doubt. Such, for example, is the case with the great Athenian sculptor, PHEIDIAS. But does it follow that the records are accurate? And, in general, is it not our first duty to probe every such record to the bottom?

In B.C. 438 PHEIDIAS finished his colossal gold and ivory statue of *Athena* in the Parthenon. The expenditure—not on it only, but also in the erection of the Parthenon and other buildings—had been very great, and it was not strange that there should arise among the public a disposition to blame PHEIDIAS and his friend PERIKLES, whose business it was to control the expenses in this direction. In this state of the public mind a former assistant of PHEIDIAS, named MENON, appeared on the scene, charging him with having appropriated part of the gold supplied to him for the statue. As it turned out, however, the gold had been so employed on the statue that it could readily be removed and weighed, the result of which process showed that PHEIDIAS was entirely innocent of the charge. Such appears to have been the first and only charge ever made against him, when all the tales that in after-times grew up around it are swept away. To sweep them away is no easy task, as Mr. MÜLLER-STRÜBING has recently found. His elaborate article \* on the subject is of the greatest interest.

It is easy to understand how a subordinate like MENON may have been puzzled to account for the care which he saw being taken to plan the golden drapery of the goddess so that it could be removed at any time. Possibly he was not aware that the gold so employed was part of the sacred treasure, and had constantly to be accounted for as exactly as loose gold would be by the outgoing treasurers to their successors. Had it not been removable, each succeeding set of officials must have taken its value on the faith of their predecessors. It is strange, no doubt, that there was so little faith shown in the matter, and very probably there were other reasons at work as well. So large a quantity as 44 talents of gold would not perhaps have been safe in a future emergency; and unless the statue had been so planned that this gold could be removed without in reality disfiguring it, a spectacle might have presented itself which would have been anything but agreeable to the Athenians in their hour of need. As it was, when the gold was removed there was left still a draped figure of the goddess, probably in wood.

We could imagine an artistic proceeding of this kind to have been in itself sufficient to give rise in later times to a variety of popular tales clinging to the name and fame of PHEIDIAS, as often unscrupulous as not. The misfortune was that in his own time it provoked the charge we have mentioned.

For there can hardly be a doubt that it is to it that ARISTOPHANES refers in his play of the "Peace" (v. 605), which was produced at Athens in B.C. 421—that is, about seventeen years after the finishing of the statue of *Athena*. His ancient commentators are explicit on the point. But they are not content with this; nor is PLUTARCH in his life of PERIKLES. They all seem to have thought that so serious a charge must have had some other ending, and accordingly they proceeded to search the older literature. PLUTARCH found that the charge of appropriating the gold having failed, PHEIDIAS was next indicted for the offence of having introduced among the Greeks fighting with Amazons, on the shield of the goddess, portraits of himself and of PERIKLES. At the conclusion of the trial PHEIDIAS went to prison, and died there, while MENON, the informer, was publicly rewarded. To PLUTARCH's mind it is evident that the one charge had followed the other immediately, and since he must have known that PHEIDIAS had spent some six or eight years at Olympia making the statue of *Zeus*, after he had finished the *Athena*, he must have supposed that this double trial had taken place after the return of PHEIDIAS to Athens. But we know from an ancient chronicle of events that the trial for appropriating the gold took place when the statue was finished, in B.C. 438, and that PHEIDIAS thereafter proceeded to Olympia to accomplish his great work there; so that if he ever was charged with impiety as regards these portraits, and punished with imprisonment which led to his death, it must have been after he had completed his task at Olympia.

But this story of the portraits had a fascination in antiquity. Why, it was asked, were not the objectionable portraits removed from the shield? To this the answer was: PHEIDIAS had cleverly contrived that they could not be taken away without bringing down the whole statue! Thus in the one story the whole gold of the statue could be removed without injury, and in the other not even a small piece of the relief on the shield could be touched without a collapse. The curious thing is that the inventor of the story should have thought of portraits as a principal element in it—the more so since, according to PAUSANIAS, portraiture was so far from the manner of PHEIDIAS. It reminds us of the tale which PLINY has preserved of the two architects BATRACHUS and SAURAS, who being denied the right of inscribing their names on the portico of OCTAVIA, which they built in Rome, attained their end by making on the bases of the columns a figure of a frog (for BATRACHUS), and of a lizard (for SAURAS). PAUSANIAS must have been familiar with the shield of the goddess at Athens—he refers to it more than once; and yet he mentions the figure of PANTARKES at Olympia as the only instance he knew of a portrait by PHEIDIAS. More than that, he states in one place that the shield of *Athena* was copied by artists, whom he names, for a statue they were employed on; and it is neither likely that they would have copied the portrait of PHEIDIAS, nor probable that PAUSANIAS would have omitted the fact had they done so.

The figure of PHEIDIAS, as it appeared on the shield, was that of a bald-headed old man, says PLUTARCH, who doubtless knew that PHEIDIAS had lived to an advanced age. But he can hardly be supposed to have reached this stage of life at the time of his finishing the *Athena*; or rather we should say, it can hardly be conceived that a bald-headed old man should have still before him the greatest work of his life, the statue of *Zeus* at Olympia. On the other hand, it is possible that he had left the shield of *Athena* undecorated, just as he had left the shield of the famous bronze statue of her on the Acropolis, and had, on returning from Olympia, completed it in the objectionable manner which brought him to prison and closed his career. But on that theory we should have to suppose that the calling of him to account for appropriating the gold, or the ivory as others say, was also put off till his return, and this we know was not the case. Nevertheless, the narrative of PLUTARCH is confirmed by a marble shield in the British Museum, which appears to be a copy from the shield of the *Athena* made by a rude and unskilful hand in a late period of antiquity. There we see PHEIDIAS figured as a bald-headed old man swinging over his head a battle-axe—not raising a stone as PLUTARCH says—to strike an Amazon: the figure of PERIKLES corresponds more closely to the narrative. There is no attempt to conceal the individuality of PHEIDIAS. Indeed, it is far too obtrusive, though that, perhaps, could be accounted for by the desire of the copyist to emphasise the story of the portraits. Clearly the man who made this shield had the same source of information as PLUTARCH, but it

\* In Fleckeisen's "Jahrbücher," 1882, pp. 289-340.

does not follow that the shield of PHEIDIAS was that source. Admitting, however, that PHEIDIAS had introduced among the figures on the shield resemblances to himself and to PERIKLES, we need not therefore believe that they could not be removed without bringing down the statue, that he had recourse to portraits because he was not allowed to inscribe his name on the statue, or that he was punished so severely. About the whole affair there is an atmosphere of confusion and credulity. ARISTOPHANES in the "Peace," probably reproducing the common belief of the time, says that PHEIDIAS had got into trouble, and that PERIKLES, fearing it would also overtake himself, got a decree passed against the Megareans, with the design of escaping public censure amid the turmoil which would arise. The ancient commentators on ARISTOPHANES add a note that the trouble of PHEIDIAS here referred to was his being charged with having appropriated part of the ivory—as one says, part of the gold according to another—supplied to him for the statue of *Athena*. Accepting two clever emendations of Mr. MÜLLER-STRÜBING, we next read in the note in question that, "having been acquitted, he went to Olympia, and there, having completed the statue of *Zeus*, died highly-honoured by the people of Elis." We know, in fact, that his workshop at Olympia was maintained as he had left it for sightseers in after-ages, and that his descendants held the office of keeping the great statue in due order. Yet how different the unaltered and unexplained statement of the commentators! There we find PHEIDIAS condemned at Athens, escaping to Olympia, again condemned by the Eleians after having made the statue of which they were so proud, and finally executed by them. It is a great relief to have these tales swept away.

#### POLYCHROMATIC DECORATION.\*

AT a time when the guardians of English churches were beginning to revel in the beauty and fitness of white-wash for mural decoration ADDISON was speculating on the possibility of the colour sense, and it alone, surviving all the transformations which follow death. The other images which the senses are supposed to receive from matter might, according to him, be found to be delusions hereafter, but "the ideas of colours are so pleasing and beautiful in the imagination that it is possible the soul will not be deprived of them, but perhaps find them excited by some other occasional cause." This was written in 1712, but we have not yet reached the transcendental stage when colour can be esteemed to be worthy of immortality. Hitherto we have been accustomed to regard it as something that was better adapted to the requirements of foreigners than to our own. In painting we gave the preference to form, and in architecture we ignored colour altogether. Only thirty years have elapsed since there was an outcry when it was announced that the cast-iron columns and girders of the first Exhibition building in Hyde Park were to be painted in more than one colour, and it was prophesied that the structure must appear like a harlequin's suit, and that the value of the articles exhibited would be lessened in consequence. A more natural, and therefore a better, spirit now prevails, but we are still far from being duly sensible of the absence of colour from buildings, and especially from churches.

It must, however, be allowed that those who are not in favour of polychromatic decoration in churches have some reason on their side. There is in the first place the question of cost. Wall painting in this country soon fades, and therefore requires perpetual renewal. But in many a parish it is difficult to raise funds to keep the fabric of the church in a sound condition, and in such places no decoration which entails expense can be expected to meet approval. The advantage of introducing polychromy into old churches (unless where there is already evidence of the existence of colour) may also be doubted. The side-chapels of Notre Dame, which were painted under the direction of the late VIOLETTE LE DUC, are now the least venerable parts of the cathedral; and the striped columns in the old Paris church of St. Germain des Prés are not so impressive as the plain masonry of many an English church. Few men in our time have done more towards extending the application of polychromy than M. CHEVREUL; but even he was opposed to its indiscriminate introduction into old build-

ings. He tells us that after long reflection on the subject he came to the conclusion that there is nothing to surpass the play of light and shade on the natural surface of the stone on walls and columns, when varied by the rays which have passed through stained-glass windows. The vault of Rheims Cathedral was in his eyes more effective before it was painted blue and powdered with *fleurs-de-lys* for the coronation of CHARLES X. All this should be remembered by people who recommend colour decoration as if it were a simple matter. There is, too, another consideration. When work of this kind is proposed, it very often happens that it is not considered necessary to consult an architect. The decoration may be entrusted to some local tradesman, who is supposed to furnish a design, or the design may be prepared by a young lady or other amateur, who is not versed in the characteristics which distinguish styles and periods. We have heard of a case where a sharp undertaker secured the "adornment" of a chancel, having heard at a funeral that a memorial of a man he was burying was to take that form. Many of our readers could tell stories of a similar kind, and know by experience how painful it is to find their buildings debased by absurdities which are supposed to be decorative, and which they have no opportunity to repudiate.

Messrs. AUDSLEY are, of course, acquainted with the unsatisfactory conditions under which decoration is conducted in this country, and if the book of examples which they have lately issued is followed, much will be done towards minimising the evils which arise whenever work is entrusted to men who have not made a special study of the subject. The authors have explained the use which may be made of their book.

"It is not," they say, "intended for those who are already skilled and learned in the subject, yet to them it may occasionally prove useful by supplying hints. To students and younger members of the architectural profession, to decorative artists, and practical painters generally, it will form a valuable and suggestive book of reference, containing designs based upon ancient authorities for the characteristic ornamentation of the various portions of ecclesiastical and domestic buildings erected in the several styles of Gothic architecture. To those amateurs who amuse themselves by decorating their own dwellings, furniture, &c., or who lend practical help in beautifying their village or country churches, this work will be of great benefit, for it contains more hints and suggestive designs, systematised for their use, than can be found in all the works already published on the polychromatic decoration of mediæval buildings."

The authors, it will be seen, do not underrate their work. It would perhaps show better taste if they had left it to the public to decide, without dictation, whether the book was so valuable and superior, but in justice it must be said that they have only anticipated the general opinion. The book is, indeed, entitled to great praise, no matter in what way it is judged, and to others besides amateurs and novices it will be an acquisition.

In designs for polychromy there are two things to be considered, namely, the colours and the ornament. Messrs. AUDSLEY are opposed to the use of the primary colours in Gothic buildings in wall decorations, and they do not look with favour on the secondaries. In one place they say that red, blue, and yellow should be very sparingly used, although valuable in salient lines or points of effect when associated with the secondary mixed or low-toned colours. In another place it is explained that, with the exception of a red approaching vermillion, the primaries and the secondaries (orange chrome and deep emerald green) are absent from the plates. Again we find it stated that "the use of pure or positive colours in mural and other decorations is much to be condemned, especially in ecclesiastical structures and domestic buildings in the mediæval styles. Such garish pigments as vermillion, ultramarine, emerald green, and the chrome yellows, have during late years been freely used, to the utter destruction of repose and artistic effect. Such works as the interior decorations of the Sainte Chapelle at Paris, and the modern church of Notre Dame de Bon Secours near Rouen, are examples of the injudicious use of crude and too brilliant colours, resulting in a garish effect in both cases." It will be contended that the finest decorations in the world depend for much of their success on the use of primaries. As OWEN JONES said, the primary colours are never vulgar or discordant when properly applied; the defect will lie, not with the colours, but with the want of skill of the hand that applies them. There is, however, less risk in the use of tertiary and mixed colours, and, besides, the general preference in our time is for quiet colours in dress and drapery as well as in

\* "Polychromatic Decoration, as applied to Buildings in the Mediæval Styles." Thirty-six Plates in colours and gold, with general introduction and descriptive letterpress. By W. & G. Audsley, Fellows of the Royal Institute of British Architects. London and Manchester: Henry Sotheran & Co. 1882.

pictures. It must not be supposed that the designs in Messrs. AUDSLEY'S book are made up of the muddy and doleful colours which are often found in modern decoration. The plates are bright and cheerful, and some may be even thought too brilliant for church work. The authors appear to have a preference for a ground of delicate chrome yellow, against which the figures in red, blue, brown, and gold, stand out effectively. The scheme of colour in every plate has been prepared with care, the combinations are often ingenious, and in cases which depend upon a self-colour the result is never commonplace. As befits Gothic work, gold is frequently employed.

The majority of the figures are intended to be produced by stencilling, and their character is determined by the process. They are all firmly drawn and are geometrical in their conventionalism. The patterns comprise varieties of "brick patterns," diapers, brocades, powderings, borders, bands, crests, medallions, spirals and zigzags, arcades, animals, &c. In fact, there is no kind of ornament adapted for a mediæval building which is not represented. But it would have been an advantage if the authors had suggested something about the scale of the figures. There is a limit to the effective enlargement of some patterns, and amateur decorators are apt to overlook this.

The plates have been lithographed in Paris, and it is hardly necessary to say that the execution of them is perfect. They form a series of examples in the adaptation of colour which may often be followed in other work besides mural decoration, and in other styles besides the mediæval. Messrs. AUDSLEY have carried out important works of decoration, and therefore they are presenting the results of experience, and not a piece of bookmaking. They say that the present work may be followed by another on mediæval decoration of a more advanced type, but we confess that we do not care to see examples of figure-painting produced to enable amateurs to amuse themselves on the walls of churches. Planting of that kind should always be entrusted to artists of position when carried out. Messrs. AUDSLEY would, however, render a service to many if they prepared a volume on Renaissance ornament in polychrome. There are no men in England more competent to undertake such a work.

### CAMBODIAN ANTIQUITIES.

IN the end of last year M. Delaporte went out to Cambodia, commissioned by the French Government and supported by that of Cochin China, for the purpose of exploring further the mysterious and gigantic architectural remains which abound in Cambodia, the origin and purpose of which have so exercised archæologists. M. Delaporte was accompanied by a large staff, and on his arrival at Phnom-Penh, the capital of Cambodia, proceeded directly to the celebrated ruins of Angkor. These he examined with great minuteness, and, according to a statement just published, believes he has been able at last to solve the difficult problem of the purpose of the religious buildings of this ancient metropolis of Indo-Chinese civilisation. His discoveries have led him to the interesting and unexpected conclusion that these ancient Khmer temples were dedicated to Brahminism. At Angkor-Wat he detached from the higher parts the *chefs-d'œuvre* of Cambodian sculpture: bas-reliefs, once brilliantly gilt; pediments, all the subjects of which M. Delaporte maintains, down to those which decorate the most secluded sanctuary, are devoted to the exploits of Rama and the glories of Vishnu. At Angkor-Tom, M. Delaporte visited several new monuments, on most of which he also finds on the principal pediments the exploits of Rama and Vishnu. He believes he has proved the presence of the *lingo*, the emblem of Siva. He cleared of rubbish and explored the ancient palace of the Khmer kings, a work of magnificent and wonderful sculpture, the rising terraces of which are adorned with superb compositions in bas-relief; the enormous three-headed elephant, Iravâti, is here enthroned in all the places of honour, as at the angles of all the gates of the city, where he is shown by the god Indra, accompanied by two *apsaras*, or celestial *danseuses*, of his paradise. M. Delaporte had already collected 300 photographs, forty mouldings, and a small number of original specimens of great value, when he and some of his staff were compelled to return to Saigon in ill-health; thence M. Delaporte sailed for France. The work of excavation and exploration has, however, been carried on by a substitute in the absence of M. Delaporte. Since the latter's departure much additional work has been done in photographing, moulding, and collecting specimens. The detailed results of this fresh work on these celebrated ruins will be looked for with interest by archæologists. A Brahminical origin has never been attributed to them, though a solution has been sought both in Buddhism and serpent-worship.

### THE PAROCHIAL POSITION OF THE HOUSES OF PARLIAMENT.

ON the 13th inst. Mr. Justice Chitty delivered judgment in the case of *Combe v. De la Bere*, which is better known as the Prestbury Ritual Case, and has been before the courts since 1874. Sentence of deprivation of his cure in the diocese of Gloucester and Bristol had been pronounced against the defendant by Lord Penzance. One of the objections raised against the sentence was that his lordship had pronounced it in committee-room E of the House of Lords, which formed part of a royal palace and residence, and was therefore outside the province of Canterbury and exempt from the ecclesiastical jurisdiction.

Mr. Justice Chitty said it appeared from the sentence itself that it was signed and promulgated by Lord Penzance, as Official Principal of the Arches Court of Canterbury, "in committee-room E of the House of Lords at Westminster." It was a principle of law that a judge who had only a local jurisdiction must exercise his jurisdiction within the locality over which it extended. If committee-room E of the House of Lords was not within the province of Canterbury, a prohibition ought to go against further proceedings under the sentence. It was remarkable that Lord Penzance, sitting in committee-room E, on the hearing of an application in the course of the proceedings in the first suit on January 10, 1878, himself raised the question whether he could lawfully exercise his jurisdiction as Dean of the Arches in that place. After some slight discussion, he stated (according to the shorthand notes produced in the present proceedings) that he would consider the matter, and that, if necessary, the case should be brought on before him in some other place. So far as appears, the subject then dropped, and was not subsequently called to his attention, and he had not therefore had the advantage of any expression of opinion on the part of that learned judge on the point, except that he did, when pronouncing the sentence in question, actually sit in the same committee-room. It was upon two grounds argued that this committee-room was a place exempt from the jurisdiction of the Arches Court—first, because it was not within the province of Canterbury, being within a royal peculiar exempt from the Archbishop's jurisdiction; secondly, because it was within the royal palace of Westminster. The gist of the argument was taken from the resolution in *Nyerford's* case, stated by Lord Coke in the 3rd Inst., p. 141, to the effect that the King's palace at Westminster was a place exempt from all jurisdiction of its ordinary, as well by reason of the royal dignity and Crown, as of the liberty of the Church of Westminster, and particularly in the presence of the King during the holding of Parliament there, so that no citation or summons could be lawfully served there. This resolution was come to in a suit in which the King and the Abbot of Westminster and certain officers of the King were prosecutors. The case was more fully stated in "*Prynne's Parliamentary Writs*," 1189-1198. The case of *Bogo de Clare*, mentioned in the 4th Inst., 23, and also more fully stated in "*Prynne's Writs*," 819, was to the like effect. As to the first ground, it was proved by evidence put in on the part of Mr. De la Bere that the whole of the Palace of Westminster was locally situate within one or other of the two parishes of St. Margaret's and St. John's, Westminster. In the appendix to the "*Valor Ecclesiasticus*," as printed by royal command in 1810, there appeared a certificate, under the hand of the Bishop of London, which was admitted to be correct, that the rectory of St. John the Evangelist, Westminster, and the curacy of St. Margaret's, Westminster, were "*peculiar*" subject to the jurisdiction of the Dean and Chapter of Westminster. This jurisdiction had apparently belonged in former times to the Abbot of Westminster, and had passed to the Dean and Chapter at the Reformation. The monastery, being a royal foundation, was apparently a royal peculiar, but, according to the record in *Bogo de Clare's* case, had become subject to the jurisdiction of the Pope, and as such subject ecclesiastical to the immediate jurisdiction of the Crown as head of the Church. This fact appeared from the statement in page 557 of the appendix to the report of the Ecclesiastical Commissioners of February 15, 1832. It was an important fact that the certificate of the Bishop of London and the appendix to the Commissioners' report, which purported to give an exhaustive list of all peculiars within the ambit of the diocese of London, did not specifically mention the Palace of Westminster, the reason being that the palace was locally situate within one or other of the parishes of St. Margaret and St. John. There was no ground whatever for saying that there was any ecclesiastical jurisdiction within the palace at the time of the passing of the statute 6 and 7 William IV., cap. 77, except that already mentioned. It was true that within the old palace there formerly stood the chapel of St. Stephen, reputed to have been founded by King Stephen. The dean and canons of the chapel were incorporated and endowed by royal charter by Edward III., and apparently became a royal peculiar. But the corporation was dissolved at the Reformation and its property granted away to subjects, except the building of the chapel itself, which fell to the Crown and was used from about that time by the Commons as their House, until it was burnt down in 1834. All ecclesiastical jurisdiction arising in respect of St. Stephen's chapel ceased at the Reformation. In that state of things the statute of 6 and 7 William IV., cap. 77, was passed, one

of the objects of which was to put an end to the confusion which had arisen in ecclesiastical matters by reason of the existence of peculiars. There were, as appears from the report of the Ecclesiastical Commissioners, upwards of 300 of such special ecclesiastical jurisdictions in England, including royal peculiars, of which there were 11. The Commissioners recommended the abolition of all peculiars. By the 10th section of the 6 and 7 William IV., cap. 77, the Ecclesiastical Commissioners were directed to prepare and lay before the king in Council such scheme as should appear to them to be best adapted for carrying into effect certain recommendations in their report, and in particular it was provided that "it shall be competent for them to propose in any such scheme that all parishes, churches, or chapelries which are locally situate in any diocese, but subject to any peculiar jurisdiction of the bishop of the diocese in which the same are locally situate, shall be only subject to the jurisdiction of the bishop of the diocese within which such parishes, churches, or chapelries are locally situate." After providing, by section 12, for the approval and ratification of such schemes by Order in Council, it was enacted by the 14th section that any such Order in Council, when registered and gazetted, should in all respects and as to all things therein contained have the same force as if every part thereof were included in the Act itself, any law, statute, canon, letters patent, grant, usage, or custom to the contrary notwithstanding. In pursuance of these provisions a scheme relating to the diocese of London was proposed by the Commissioners and ratified by the Queen in Council on August 8, 1845, and subsequently duly gazetted. This Order provided that all parishes and places locally situate within the limits of the several dioceses of Canterbury, London, and certain other dioceses, and all churches and chapels, and the whole clergy and others locally situate within the limits of such parishes and places respectively, should, notwithstanding any peculiar jurisdiction or exemption from jurisdiction which any of such parishes, &c., might then possess, or be subject to, or claim to be possessed of or subject to, should be respectively under and subject to the jurisdiction and authority of the bishops of the said several dioceses, and of the archdeacons of such several dioceses within the limits of which several dioceses and archdeacons they should respectively be so locally situate, and to no other ecclesiastical jurisdiction whatsoever, except the cathedral churches of and within the said several dioceses and the royal residences, and the churches or chapels founded therein or annexed thereto, including the Collegiate Church of St. Peter, Westminster, which should respectively be subject to the jurisdiction and visitation, if any, to which they were then by law respectively subject, and to none other; and with the like exceptions all and each of such parishes, &c., so possessing or being subject to, or claiming to possess or be subject to, any such peculiar jurisdiction or exemption from jurisdiction should severally and respectively be included in and form part of the dioceses and archdeacons respectively within the limits of which they should respectively be so locally situate. In 1840 a statute, 3 and 4 Vic., cap. 113, was passed relating, among other things, to the parishes of St. Margaret and St. John, Westminster. By the 20th section of that Act the rectories of these parishes were annexed to two canonries of Westminster, and it was provided that those parishes should become and be part of the province of Canterbury, of the diocese of London, and of the archdeaconry of Middlesex, and that the said parishes and the rectors and other ministers and officers thereof should in ecclesiastical matters be subject only to the jurisdiction of the Archbishop of Canterbury, the Bishop of London, and the Archdeacon of Middlesex respectively, in the same manner as other parishes in the said province, diocese, and archdeaconry were respectively subject thereto, and be exempted and relieved from all other ecclesiastical jurisdiction whatsoever. The effect of these enactments and order in Council was to abolish the peculiar which the Dean and Chapter of Westminster had in the parishes of St. Margaret and St. John, and consequently in the palace at Westminster, proved, as already mentioned, to be locally situate within one or other of them. It was, however, contended that the Crown, not being specially named, was not bound by these statutes and order, and that the peculiar ecclesiastical jurisdiction which the Crown, as paramount head of the Church, possessed over the palace as the peculiar of the Dean and Chapter of Westminster still continues to exist. This contention could not be maintained. The language of the statutes and the order was precise. Not only was the then existing peculiar jurisdiction taken away, but the jurisdiction of the Archbishop of Canterbury was established locally in the places mentioned. Beyond doubt the Crown was bound by the affirmative and negative provisions. The very special case of the Deanery of St. Buryan, in Cornwall, and the statute 13 and 14 Vic. cap. 76, were referred to in order to show that the Crown was not bound. But they could not countervail the effect as stated. That case had no bearing on any question as to the force of the statute 3 and 4 Vic., cap. 113; at the utmost it could relate only to the construction and effect of the statute 6 and 7 Will. IV., cap. 77, and the Order in Council, a similar order having been made on February 11, 1848, in reference to the diocese of Exeter before the statute 13 and 14 Vic. was passed. The deanery was a donative of the Duke of Cornwall, as well as a royal peculiar,

and the statute 13 and 14 Vic., cap. 76, not merely abolished the peculiar, but the deanery itself. Possibly the Order in Council of February 11, 1848, was overlooked when this statute was passed. Other royal peculiars were abolished by similar Orders in Council made in pursuance of the statute 6 and 7 Will. IV., cap. 77, and were not, so far as could be ascertained, dealt with by subsequent Acts of Parliament. Gillingham and Bridgnorth might be mentioned as instances, and a further search would probably discover others.

Then as to the second ground, as to the supposed exemption by reason of the palace at Westminster being a royal palace. The distinction between a royal palace simply and a royal palace which was also a royal residence, was now well settled by a series of authorities. The distinction was as early as the time of Lord Coke, who, in commenting on Nyerford's case, said that "this royal privilege is not only appropriated to the palace of Westminster, but to all the King's palaces where his royal presence resides, and this privilege is to be exempted from all ecclesiastical jurisdiction '*regiæ dignitatis et coronæ suæ ratione*'" (3 Inst., 141). Lord Ellenborough, referring evidently to this passage, stated that he had the authority of Lord Coke for saying that by the common law no process ought to be executed within any palace where the King's royal person resided (see 1 Campbell, 475). The distinction was obviously known to the framers of the Order in Council of August 8, 1845, where the exception is not of the royal palaces, but of the royal residences. The later authorities further showed that the exemption did not belong to the place except only so far as it was connected with the person of the Sovereign, and that in order to give the exemption the Sovereign need not be personally residing or actually residing in the place; virtual residence is sufficient. The authorities were guides to show what was the proper inference to be drawn from the facts. In the Hampton Court case the facts were that the chief officials and the chaplain, together with the housekeeper and the gardener, were all appointed by the Crown and paid out of the Civil List; that a pew was always kept in the chapel ready for the royal use; that there were certain apartments, then known as State apartments, in which pictures belonging to the Crown were exhibited to the free inspection of the public; that a guard of honour was always posted there; that the inmates to whom the Sovereign had granted the use of apartments then held such apartments at the pleasure of the Crown; and that the grapes grown in the vinery were kept for the service of her Majesty's table. The Queen herself had never resided there. The circumstances were such as to give rise to a remarkable difference of opinion among the learned judges before whom the case came, but the House of Lords decided that Hampton Court, although a royal palace, was not a royal residence. Lord Chelmsford, in advising the House, stated that the question was—Is the palace so occupied by others as that her Majesty could not immediately return and reside in her own person if she were pleased to do so? Now, what were the facts in relation to the existing edifice at Westminster? For it was with that building alone that he was now concerned. The old palace, which had in the course of time been considerably enlarged, was, as was well known, burnt down in 1834, and the present palace was erected on a much more extended site, the extension being principally towards the south. It had been a matter of contest before the Court whether committee-room E did or did not stand on part of the site of the old palace. No satisfactory proof has been adduced on either side. The burden of proof would rest on those who claimed the exemption, but his lordship did not think that this question of fact was material. The present palace had never, in fact, been used as a royal residence. In the statute 30 and 31 Victoria, cap. 40, passed to enable the Commissioners of Works to acquire lands for the purposes of "the new palace at Westminster" it was styled in the preamble "her Majesty's new palace at Westminster, commonly called the Houses of Parliament" and in the body of the Act it was styled "the new palace at Westminster." The short title of the Act was "The Houses of Parliament Act, 1867." The palace had not been constructed or fitted up for the residence of the Sovereign. It was under the control, not of the Lord Chamberlain of the Household, but of the hereditary officer known as the Lord Great Chamberlain, who had (as appeared by the certificate or letter of the Deputy Lord Great Chamberlain put in evidence on the part of Mr. De La Bere) the general control and keeping in order of the House of Lords and its committee-rooms, except during the session of Parliament, during which the key of the House of Lords was entrusted by the Lord Great Chamberlain to Black Rod. This certificate also stated as follows:—"What apartments shall be kept for her Majesty's use on the occasion of her coming to Parliament is a matter as to which her Majesty's personal wishes would be ascertained whenever the occasion might arise, and would be instantly obeyed without any question of right or authority in the matter, so that nothing that might be done in reference to this could affect any question of legal rights." It also stated that there were no records of her Majesty having assigned portions of the palace, when the new palace was built, to the House of Lords and the House of Commons respectively, but that possession of the different parts of the new Houses was given, as they were ready and complete for occu-

pation, under the authority of the then Lord Great Chamberlain. In fact, the two distinct parts of the building known as the House of Lords and the House of Commons, with their respective libraries and committee-rooms and other conveniences, had, ever since the completion of the edifices, been devoted solely to the use of the Lords and Commons respectively. It was true that her Majesty's throne was in the House of Lords, and that the Queen summoned her Parliament to meet her at Westminster, and attended there in the House of Lords whenever it pleased her so to do for the purpose of opening or proroguing Parliament. But in his lordship's opinion the existence there of the throne, and the circumstance of her Majesty attending the House of Lords occasionally on great occasions of state, were not sufficient, when taken in connection with the facts of the actual occupation of the building by the Lords and Commons, to make the palace at Westminster a royal residence.

An argument addressed to the court on behalf of Mr. De La Bere in this part of the case must not be wholly passed by. It was an argument founded on the statute 28 Henry VIII., c. 12, for declaring the limits of the King's Palace of Westminster. The ancient palace, which was built or enlarged by Edward the Confessor, and had been used as a royal residence by many sovereigns after the Conquest, had in Henry VIII.'s time fallen into ruin, and that monarch after his acquisition of Cardinal Wolsey's house at Westminster, called York Place, and now represented by Whitehall, purchased (to use the language of "Holinshed's Chronicles," 775) "all the meadows about St. James, and there made a fair mansion and a park for his greater commodity and pleasure; and because he had a great affection to the said house at Westminster he bestowed great cost in going forward with the building thereof, and changed the name so that it was after called the King's Palace of Westminster." The statute of 28 Henry VIII., c. 12, passed a few years afterwards, enacted that all this additional property, and also the soil of the ancient palace, should be thenceforth the King's whole Palace at Westminster, and should be taken and called the King's Palace at Westminster for ever." The statute extended the limits of this palace up to Charing Cross, and annexed to the palace within these extended limits all the privileges of the ancient palace, which was thenceforth to be deemed only as a member of the new palace. Upon this statute it was argued that the privileges of a royal palace were affixed to Westminster Palace in perpetuity, but besides proving too much (for counsel for Mr. De La Bere, who certainly were not deficient in boldness, declined to assert that the privileges now extended to the entire district up to Charing Cross), this argument merely came back to the question, What were the privileges of a royal palace?—a question already disposed of. The same observation applied to the argument founded on the jurisdiction of the Queen's Ancient Coroner, which existed, or was claimed to exist, in all the royal palaces without distinction. There was another equally fatal objection to the argument of Mr. De La Bere in regard to the palace. The privilege of exemption not being appropriated to the locality itself, being a personal privilege of the Sovereign, communicated to the place only during the actual or virtual residence of the Sovereign there, could plainly be waived or dispensed with. In "Nyerford's case" and "Bogo de Clare's case," the proceedings were at the suit of the Crown and the officers of the Crown, whose offices were disturbed, as well as of other parties aggrieved. In "Sparks v. Sparks" (7 Taunton, 311) it was held that an arrest within the verge of the palace was no ground for discharging the defendant out of custody, Park, J., saying that if those who had jurisdiction were injured, it was for them to complain, and Burroughs, J., stating that the point had been decided twenty years ago upon solemn argument. In "The King v. Hobbs" (3 Term Reports, 735) the defendant was indicted for assaulting and imprisoning an officer of the Palace Court within the King's Palace at Westminster, his Majesty being actually resident and abiding in his royal person in the palace. A special verdict sets forth the statute 28 Henry VIII., cap. 12 (already referred to), and letters patent of Charles II., constituting the palace court (which had since been abolished by statute). Lord Kenyon, in giving judgment, stated that supposing there were certain privileges annexed by the common law to the King's palace prior to the reign of Charles II., yet undoubtedly the king had the right to dispense with any of those privileges, and he held that the King had, by the charter of Charles II., dispensed with some of them as respected the palace at Westminster. So in the judgment of Willes, J., Keating, J., and Montagu Smith, J. (reported L. R., 3 Ex. 298), in the "Hampton Court case" those learned judges stated that it was not likely that the existence of the privileges claimed would ever lead to injustice or inconvenience, as an application to the Lord Steward, or other proper officer of her Majesty's household, would always obtain a remedy for the creditor either by a permission to execute process within the palace, or by insisting upon the prompt discharge of the debt as a condition of the enjoyment of her Majesty's bounty. Lord Hatherley in his speech advising the House of Lords, in the same case (4 H. L., 369), adopts this passage. Lastly, it was admitted that Lord Penzance sat in committee-room E of the House of Lords, with the permission of the Lord Great Chamberlain, the proper officer of the Crown to grant such permission.

For these reasons he must hold that the second ground of objection also failed. The result was that the order *nisi* must be discharged, and with costs.

It is understood that the case will be brought before the House of Lords in order to determine in what diocese the Committee-room of the House of Lords is situated.

### THE WORCESTERSHIRE EXHIBITION.

THE Exhibition which was opened at Worcester on Tuesday by Earl Beauchamp is remarkable as illustrating local industries as well as the treasures possessed within the boundaries of the county. The buildings formerly used as the West Midland Waggon Works have been adapted for the Exhibition under the direction of Messrs. Henry Rowe & Son at a cost of about 2,000*l*. The superficial area is about 54,000 feet, all of which is occupied. In the nave the place of honour is given to the Worcester Royal Porcelain Company (Limited), a splendid selection of whose choicest products are arranged upon the shelves of two large curving stalls. In the centre of the floor, and surrounded by a tastefully-placed collection of plants, stands Mr. Brock's bronze group, *A Moment of Peril*, lent by the Royal Academy, by whom it was purchased for the nation under the terms of the Chantrey bequest. A fountain in Doulton ware is placed just in front of the orchestra, and Messrs. Doulton & Co. are also exhibitors of a case of smaller works in faience impasto, pâte-sur-pâte, and Doulton ware. Among the local industries represented are the tiles made by Webb's Worcester Tile Company, and the cast iron and hardware of Messrs. Baldwin, Son & Co.

The Fine Arts Section occupies five galleries, and includes eight large cases lent from the South Kensington Museum. Messrs. Elkington have sent four cases of art work. Earl Beauchamp, the president of the Exhibition, contributes a large case of Sévres china, including examples of turquoise blue ware, with subjects in the medallions painted in many instances by noted artists. The rear of the case is occupied by about forty specimens of Limoges and other enamels. Next come three cases lent by the Earl of Dudley; two of them contain treasures of old Worcester porcelain with scale blue ground and rich gildings and paintings, while in the third is the *déjeuner* service of jewelled porcelain presented to the Countess of Dudley by the city of Worcester on her marriage in 1865; also a similar service in royal blue, with subjects in gold. A very large collection of old Worcester ware is contributed by Mr. Frederick Bodenham, of Hereford, in which a special feature is made of the early blue-and-white porcelain. The representation of this ware is rendered additionally complete by loans from Lady Mary Ponsonby, Mr. T. J. Callowhill, and Captain Castle. Carvings in ivory and hard woods, antique silversmiths' work, cashmere metal goods, and other articles of virtu are exhibited in considerable variety.

The display of pictures by ancient and modern artists affords material for prolonged study. Among the old masters are examples of Rubens, Rembrandt, Vandyke, Holbein, Quintin Matsys, and Sir Joshua Reynolds; while of deceased artists of more modern times there are works by Turner, Müller, Etty, and Landseer. Müller is represented by an exquisite landscape, *Tivoli*, lent by Mr. J. Brinton, M.P.; and Turner by a sea-piece, lent by Mr. J. Corbett, M.P. Among the works by painters of the modern school is Holman Hunt's *Shadow of the Cross*, lent by Messrs. Agnew & Sons; and Laminais's *Les Vierges de Jumièges*, lent by Messrs. Wallis & Son. Associated with the fine-art department is a historical section, in which are comprised antiquities of various kinds, artistic and literary, and a long series of portraits of bygone members of the Worcestershire aristocracy and county celebrities, many of the portraits being from the hands of Sir Joshua Reynolds, Sir Peter Lely, Benjamin West, Kneller, and other famous painters. The Art Needlework Department has been arranged by a committee of ladies, acting under the presidency of Lady Alwyne Compton. It is principally occupied by antique productions, among which the largest display is made by a series of church vestments from the thirteenth to the eighteenth century, many of the specimens being of extraordinary beauty of design and execution. A picture, in crewels, of *Napoleon as First Consul*, by Miss Linwood, is curious. A number of samples of antique needlework are interesting, not only for their quality, but their association: for instance, there are shown the christening mantle of King James II.; an embroidered cushion used on the same occasion; a chemise used by Marie Antoinette; some articles of baby linen, said to have been worked by Princess Elizabeth for Queen Mary; lace taken from the cravat of William III.; and christening robes of several important personages. Modern work is but sparingly represented, on account of the limited space, and the samples have for that reason been the more carefully selected. Some of the choicest are embroideries from the Royal School of Art; while the work of the students in the Leek School of Embroidery and the Sloane Street School of Needlework also find places.

At the banquet which was given after the opening Earl Beauchamp said:—

It was, he believed, a matter that might be called unique, that they were able to bring together in one exhibition such a varied collection of works of art, almost all belonging to that county, and such a variety of industrial products. It was a re-

markable circumstance that the county of Worcester should contain within its borders so many products of Nature and of Art. And rich as had been the gifts with which Nature had endowed them, those gifts would be of little account if they were not converted to the use of man by the industry of their manufacturers and their artisans. It was not enough that they should enjoy those gifts of Nature, unless they should be turned to the best account; and that was a matter which for many years past had occupied some of the most sagacious minds of this country, as to how the artisans might receive technical education which would enable them to throw into their work more energy and truer principles than they had done in past times. They owed it to the Prince Consort and to those who were associated with him in 1850, prior to the Exhibition of 1851, that the results which had since been attained had been brought to perfection and within their reach. That was not the occasion to give a lecture upon the importance of technical education, or of the value of art as applied to industry. They, by their Exhibition, had recognised that Industry and Art were twin sisters, and that the one ought to assist in the development of the other, and that one could not fully appreciate industry who could not understand the principles which underlie all true art; and so they might say that he could not fully appreciate art who did not understand industrial and technical details. They might, indeed, congratulate themselves upon the Exhibition, which was, he believed, a matter of considerable importance to that county; and he trusted that they would find that the appreciation of art would find a new development among them, and that their numerous artisans would benefit by the opportunity to be gained by the Exhibition. There was a time, not so very long ago, when it was the fashion to depreciate English art and English taste in every way, and their appreciation of art and of beauty was considered to be very inferior among nations on the Continent. He ventured to think that that arose from a very imperfect recollection of the history of England. It was impossible for anybody to go up and down throughout England, and to admire the buildings reared by their forefathers, without seeing that those who reared those buildings had a keen and adequate perception of the true principles of design, and of the true principles of beauty. And those results were due to English art and to English artists, and not to foreign or extraneous aid. Many of them might remember that King Edward, on the death of his Queen, erected sixteen crosses at various places where her body rested on the way to its burial, and that those sixteen crosses, with the names of the builders, had been preserved. And it appeared that of the sixteen crosses no less than fourteen were erected by English artists, and only two of them bore foreign names. That, therefore, showed that even in early days England could hold her own in competition with architects of foreign countries. They knew that not only from the circumstances to which he had just referred. The west front of Wells Cathedral was adorned with a most remarkable series of sculptures, dating from the middle of the thirteenth century, and the names of the artisans had been preserved by the Dean and Chapter; and in a very remarkable book published by the late Mr. Cockerell—himself an architect led as far as possible to the admiration of Greek and Roman designs—the writer bore most ungrudging testimony to the beauty of the work of those English artisans whose sculpture appeared on the west front of the Wells Cathedral. They also knew that in the early Middle Ages, before the Norman Conquest, England was renowned for its work. Through the Middle Ages England was renowned for her embroidery, of which they had a noble example brought together by an admirable ladies' committee, and which adorned the walls of the Exhibition. It was not necessary therefore to enlarge upon the excellence of English art in that particular. As regarded painting, they knew that the walls of English churches used to glow with most beautiful colours and most beautiful designs. There was in the neighbouring county of Gloucester, not far from that city, a small church so decorated, the painting of which dated from the beginning or middle of the twelfth century, if not earlier. Then there were illuminated manuscripts which had come down to them; but he would not refer to decorative work of that kind. It would be enough to point to the paintings which they possessed, and to refer briefly to a remarkable school which England enjoyed: he meant the school of miniature painters. From Queen Elizabeth downwards we had had a most remarkable school of miniature painters, whose works existed in their pristine beauty; and some of them might perhaps have seen no longer ago than last Saturday that a specimen of miniature work of Hilliard's sold for no less a sum than 2,700 guineas. That showed that the work of English artists had survived from that time to the present, and was still appreciated. Coming down to the last century, he might mention the names of Gainsborough, Romney, and Sir Joshua Reynolds. When those great artists passed away they vindicated the name of England as a country not devoid of art.

**Messrs. Taylor & Co.,** of Loughborough, have just cast the big bell for the Manchester Town Hall. About 8 tons of metal have been used, independently of the hammer and fittings. The height is 6 feet, the diameter at the mouth 7 feet 7 inches, and the thickness of metal at the sounding bow is just under 7 inches.

## SMOKE ABATEMENT.

THE distribution of prizes and awards in connection with the recent Smoke Abatement Exhibition at South Kensington took place at Grosvenor House, under the presidency of the Duke of Westminster, on Friday afternoon in last week. His Grace, in opening the proceedings, said that the exhibition, although, perhaps, not so interesting as flower or cattle shows, had been very satisfactory. It had been visited by no fewer than 116,000 persons. The question of an open grate was an unsettled one, but he regarded the desideratum to be a grate which should be sufficiently open to show a bright fire, which should be smokeless, and which should secure economy of fuel. That result had, however, not yet been completely attained, but when it was realised the question would arise as to whether it should not be made compulsory. Mr. Ernest Hart, as chairman of the Smoke Abatement Exhibition Committee, said that the exhibition was an interesting one, and that so numerous and various were the kinds of apparatus as to necessitate about 1,000 applications of the tests. The experiments were conducted by Professor Chandler Roberts and Professor Frankland as to the economy of fuel, &c. The exhibition had shown that smokeless kitcheners were possible and could be fitted to any house. The consumption of gaseous fuel afforded the most promising solution of the problem how to relieve cities from the nuisance of smoke. The Committee had decided, if they could find sufficient support from the public, to form an institute, among whose objects would be to promote the better utilisation of coal and coal products—to determine practically and scientifically the means actually available for heating houses as at present constructed without producing smoke, by enabling the Committee to examine the subject generally and report for public information. After Mr. Henry Phillips had given a report of the success of the Manchester Smoke Abatement Exhibition, Lady Grosvenor presented the awards and prizes, the special Dr. Siemens prize of 100 guineas for the best utilisation of coal being divided and awarded to the Dowson Economic Gas Company (Limited) and the Falkirk Iron Company, while the Ladies' Prize of 50 guineas for the best smoke-preventing coal-burning kitchener was divided between Mr. J. F. Constantine and the Eagle Range Company, and presented by Miss Shaw-Lefevre. Professor Abel then moved the following resolution:—"That it is desirable that the work thus far carried on by the Smoke Abatement Committee be continued, and for that purpose a Smoke Abatement Institute be formed." Mr. Norman Lockyer seconded the motion, and said that there were numerous points of view in which the country might derive great benefits from the removal of the smoke, and among them scientific benefits. It was part of his official work to observe the sun, but owing to the smoky atmosphere which we had almost always over London, he could only perform his inspection once a week, and often once a month only. He believed also that a sunless place was a joyless place. The motion was carried, and a vote of thanks was passed to the Duke of Westminster for presiding.

## FLAMELESS COMBUSTION.

A NEW theory of combustion was practically illustrated by Mr. Thomas Fletcher, of Warrington, at a soirée of the Society of Chemical Industry at Owens College, the results being so totally unexpected that many present would, and in fact did, go away with the impression that some deception was being practised. Mr. Jacob Reese, the inventor of the Reese fusing disc, has stated his belief that if it were possible to produce combustion without flame, the temperature and duty obtained from any fuel would be enormously increased. It has remained for Mr. Fletcher to not only prove the possibility of flameless combustion in more than one form, but also to demonstrate practically the enormously high temperatures which can be obtained by this means. Taking a ball of iron wire about three pounds in weight, Mr. Fletcher placed it on a slab of fire-clay, and directing a blowpipe flame on it for a few seconds he suddenly blew the flame out. The temperature increased so rapidly that in a few seconds the wrought iron fused and ran into drops, and this temperature was steadily maintained. The room was darkened, but the closest examination did not show a trace of flame, although the fact that the gas was burning was proved by repeatedly relighting and extinguishing it. The same experiment was repeated in another form by directing the flameless heat into a small fire-clay chamber, in which a refractory clay crucible, made specially for nickel melting, was partially fused and worked into a ball like soft putty, the sides of the fire-clay chamber being at the same time fused. The heat was so tremendous that the blowpipe laboratory, which was given up to Mr. Fletcher for the evening, was much too hot to be agreeable, in spite of open windows and ventilators. How far this discovery can be utilised remains to be seen, but it would appear that the presence of flame, usually considered to be a sign of combustion, is really an indication of imperfect results, and the best duty is to be obtained only when flame is totally absent. It is certain that such temperatures as those obtained by Mr. Fletcher without flame have never previously been obtained with the fuel used, which was nothing more than a small gas supply for a quarter-inch pipe, assisted by an air blast.

## NOTES AND COMMENTS.

THE campaign of the Archæological Societies will shortly begin, and a little is already known of their movements. The first meeting of the Royal Archæological Institute at Carlisle will be held on August 1, and in the course of the day the Mayor will describe whatever is considered noteworthy in the town. Afterwards the Castle will be inspected, under the guidance of Mr. CLARK. There is much around Carlisle to afford materials for an interesting meeting. The rival Association will meet at Plymouth on August 21, and as the Duke of SOMERSET is to deliver the inaugural address, something original may be anticipated. In the programme are included visits to Buckland Abbey, Totnes, Dartmouth, Lydford, Tavistock, Torre, Plympton, and Liskeard, thus covering a wide area. The Kent Archæological Society will meet on August 2 at Maidstone, and on the next day there will be excursions to Leeds, Battle Hall, and Lenham.

THE Exhibition of Decorative Art will open in Paris on August 1. The Palais de l'Industrie is already transformed. On the first floor glass cabinets have replaced the pictures lately hanging there, and the collections for which they are intended are rapidly being classed, catalogued, and placed in position; while in the grand hall the rooms and pavilions destined for the exhibition of modern work in wood, stuffs, and paper are rapidly being erected. Altogether, the Exhibition is being organised on a grand scale, and gives promise of a success that will repay the labours of the committee of the Union Centrale des Arts-Décoratifs.

THE Société des Amis des Arts of the Department of Seine-et-Oise last Sunday opened its twenty-ninth annual Exhibition of Fine Arts at the Palais de Versailles. The number of exhibitors is 428, who send 747 works—pictures, sculptures, engravings, etchings, enamels, &c. The Exhibition is therefore of considerable importance, all the more so that some of the best-known names in French art are among the exhibitors. It is allowable, however, to make the remark that, as the very *raison d'être* of these Exhibitions is to develop local art, no works that have been previously shown in public should be admitted; whereas in the Versailles galleries may now be seen many paintings and groups that were on view at the Paris Salon last month. It is to be hoped that the committee will next year give more encouragement to local ability.

THE Glasgow architects, as we learn, are expressing great dissatisfaction with what they regard as the illiberal conduct of the Town Council in refusing the exhibition of the designs; and the public and the press of the city appear to take the same view of the case. Unless we are mistaken, the profession generally throughout the country will be found to support the request, if only on the simple ground that secrecy is always suspicious. The proper course for the Town Council to take is not only to exhibit the ten selected designs, but to co-operate with the Institute to secure an exhibition of the designs in the original competition. Up to the present moment the contributors to the enterprise have *not even received thanks* for their costly contributions—costly, we may certainly say, to the tune of some 10,000*l.* of hard cash at the least. We may be permitted to hope that Mr. BARRY is in no way responsible for either the refusal of the exhibition or the neglect of the compliment of thanks. He cannot but know well that publicity is the best safeguard of honesty, and that anything like reserve in this respect is the worst possible policy. Not only is all liberality of feeling absolutely due to the competitors as a moral right, but it is none the less due to the reputation of the citizens of Glasgow and to the credit of the adjudication.

THE following promotions and nominations of artists in the Legion of Honour were made on the occasion of the 14th July Fête de la République Française:—*To be Commander*: M. BONNAT, painter, member of the Institute, Officer of the Order since 1874. *To be Officers*: M. HENZEY, Professor of the National School of Fine Arts, conservator of the Louvre, member of the Institute, Knight of the Order since 1867; M. VAUDREMER, architect, member of the Institute, Knight since 1867; M. CAIN, sculptor, Knight since 1869. *To be Knights*: M. CAZIN, painter, 1st medal 1880; M. GERVEX, painter, 2nd medal 1874, *rappel* 1876; M. PILLE, painter, 3rd medal 1860, 2nd medal 1872; M. IDRAC, sculptor, Prix

de Rome 1873, 3rd medal 1877, 1st medal 1879; M. LAUSON, sculptor, 3rd medal 1875, Prix de Rome 1876, 2nd medal 1879, 1st medal 1880; M. DUTHOIT, architect of national buildings, medal in 1863 and 1864, 1st medal 1878 Exhibition; M. WALTNER, engraver, Prix de Rome 1868, 2nd medal 1870, 3rd medal 1874, 1st medal 1880; M. LAGUIL-LERMIE, engraver, Prix de Rome 1866, 2nd medal 1877.

M. DESIRÉ CHARNAY, the intrepid explorer of Central America, has just returned from his latest Mexican expedition. M. CHARNAY has discovered in the country of the Lacandous (the Mayas) the ruins of an old town, to which he has given the name of the "Phantom City." He likewise brings back with him 150 square metres of fresh architectural casts, which were taken during his journeys through various Aztec cities. They will be added to the collection of similar curiosities with which he has already enriched the Trocadéro Museum.

THE Rue Andrieux, in the Eighth Arrondissement of Paris—which takes its name, not from the ex-Prefect of Police, as might be supposed, but from the poet, JEAN STANISLAS ANDRIEUX—is not much more than 120 yards in length. It is, however, remarkable for the number of houses it contains which belong to architects. The whole of one side is taken up by the Collège Chaptal, while out of the fourteen buildings on the other side no less than nine are the property of and are inhabited by members of the profession.

THE new Hotel de Ville which has been inaugurated in Paris may be said to be a copy of the building which was destroyed by the Communists in May 1871. There is a difference in the statues, for those which appear are memorials of eminent natives of Paris. The cost of them was 1,213,660 francs. The building will cost over twenty-five million francs. It contains 368 rooms, and covers an area of ten thousand superficial yards. The architects are MM. BALLU and DEPERTHES, whose designs were selected from amongst those of sixty competitors.

THE condition of the books which came from Hamilton Palace for sale in London was a surprise to librarians. It is rare to find books in England so little affected by the atmosphere, and by the means adopted for artificial lighting and heating of rooms. The explanation given is that the rooms in which the books were kept were lighted from above, and that double sashes were used. The bookcases were guarded by wire doors, which allowed of ventilation without sacrifice of safety.

AN administrative commission, appointed to consider the question, has just reported in favour of the foundation in Paris of a School of Physics and Industrial Chemistry, and the project will now be submitted to the Municipal Council for approval. It is proposed to establish the school in the old buildings of the Collège Rollin, in the Rue Lhomond; No. 38 of the same street is to be taken in, and on its site will be erected a new building for the laboratories—five in number—for general chemistry; qualitative and quantitative analyses; physics, including electricity, heat, optics, &c.; and technological subjects. The school will receive ninety pupils, of not less than fourteen and not more than eighteen years of age at entry, who will be required to pass a preliminary and competitive examination in the elements of mathematics, physics, and chemistry. The course is to be three years.

DR. PERCY raised the complaint, when he undertook the sanitation of the Houses of Parliament, that there was not a plan available on which drains and flues were marked. If a plan could be discovered showing the position of the existing building as compared with the old buildings, it might enable the Courts to come to a decision in the Prestbury Ritual Case; for it is understood that there will be further litigation before it can be determined whether Room E is in the archdiocese of Canterbury or not. Mr. Justice CHITTY said the point was contested whether the committee-room did or did not stand on part of the site of the old palace, but no satisfactory proof could be adduced on either side. The other points in the case belong to the historian and the archæologist rather than to the surveyor, and they are found to be no less obscure. The judgment in this remarkable case by Mr. Justice CHITTY was marked by a careful examination of the evidence, but it cannot be said to be conclusive.

AGRICULTURE: A DECORATIVE FRIEZE.—PART IV.

## THE PROPOSED PUBLIC OFFICES.

THE following evidence was given by Mr. John Taylor, of the Office of Works, before the Select Committee of the House of Commons on the Public Offices Site Bill. The chairman was Mr. Shaw Lefevre, the First Commissioner of Works.

*Chairman:* You are the Surveyor of the Office of Works?—I am.

And by my instructions you have prepared the plan which is now before the Committee?—I have.

That plan provides accommodation for the War Office and the Admiralty, adjoining one another?—It does.

And it places the War Office next to the Horse Guards?—It does.

And it provides 59,000 square feet for the War Office, and 52,800 for the Admiralty?—That is so.

Are you aware that the War Office officials and the Admiralty have stated that that area will be sufficient for their purposes?—That is understood.

It also provides a block in Spring Gardens, coloured pink in the plan before the Committee, on which residences for the First Lord of the Admiralty, the First Naval Lord, and the Secretary could be built, if it were thought desirable that those officers should have residences there?—That was the intention.

And it would be available for other public purposes, if it should be thought undesirable that those officers should have residences there?—Yes.

The plan also provides for widening the entrance at Charing Cross by Messrs. Drummond's Bank to a width of 60 feet?—That is so.

And it would give access to the proposed Admiralty in Spring Gardens?—That was the intention in widening the entrance.

Will you state to the Committee whether there were reasons for not putting the façade fronting the Mall nearer to Carlton Terrace and the Metropolitan Board; do you consider that it is as near as it could be placed, having regard to the rights of the Metropolitan Board and of the people who live in Carlton Terrace?—The block coloured pink could certainly not be placed any nearer to the Metropolitan Board without injuring their lights.

I am dealing now, not with that, but with the main building fronting the Mall?—I think it is as close to the Metropolitan Board of Works as it ought to come; it would be a very high building.

What is the distance between that and the garden of the Metropolitan Board?—About 160 feet.

Do you consider that it would not be advisable to bring that frontage nearer to Carlton Terrace?—It would not, I think.

Then the plan provides that the frontage to Whitehall shall run from the Horse Guards to Messrs. Cox & Biddulph's Bank?—That is, as it is shown on the plan.

What is the length of that frontage?—450 feet.

That is considerably longer than the frontage of the new Home Office to Parliament Street, is it not?—Considerably longer.

The plan provides that the back of Messrs. Cox & Biddulph's bank should go along Spring Gardens?—The plan provides for the back of Messrs. Biddulph's bank being left as it is.

And then the building is at the rear of Messrs. Biddulph's bank?—Yes, at a distance of about 45 feet.

Do you consider that the courtyards, as shown in the plan, are sufficiently large for light and air, and for the conveniences of the Public Offices?—I am quite of opinion that they are large enough for light and air.

What is the area: the length and breadth of them?—The length of the two principal quadrangles is about 155 feet by 130 feet to 90 feet respectively.

Are those courtyards as large as the courtyards of the India Office and the Foreign Office?—None of them is so large as the principal quadrangle of the Foreign Office.

I meant the smaller courtyards?—The smaller quadrangles in the proposed new buildings are larger in area than they are in the Home Office and Colonial Office.

And are those found sufficient?—I have heard no complaint as to them.

*Mr. Gerard Noel:* The quadrangle that has "Buckingham Court" written upon it is much smaller than the other three; do you consider that sufficient?—That quadrangle is very much larger than the smallest quadrangle of the Colonial Office.

But there have been many complaints, have there not, of the existing courtyards, that they are not large enough, that the light is not sufficient; do you think that the one which I now allude to is quite ample and sufficient?—Yes, that courtyard is 100 feet by 60 feet.

It came out in evidence in 1877, if I remember rightly, that there was not sufficient light from the courtyards in many of the public offices; that is why I ask whether the one called Buckingham Court is sufficient?—I think this court is ample for the purposes of light and air; 100 feet by 60 feet.

*Sir Henry Selwin-Ibbetson:* What is the contemplated height of the new buildings?—The probability is that they would be 70 feet to 80 feet high.

In what way does that compare with the height of the buildings of the Home Office and Foreign Office existing at present?—About the same. I am assuming that height; but there has been no elevation prepared.

You assume, from the ground plan and the amount of space required, the height just stated?—Yes.

And you propose to bring that height up to the existing Horse Guards block, at 70 feet?—Not necessarily up to the Horse Guards. I think the block next the Horse Guards on either side would probably be dropped to a lower level.

I wish to ask you, with regard to the building coloured pink; that building, if erected as it is, would stand directly in the way of a straight thoroughfare, carrying out the Mall as it is at present, into Charing Cross?—It would stand directly in the way of that.

Have you had before you, or contemplated, the possibility, supposing such a thoroughfare is ultimately made, of being able to place a building of a similar size and character to the pink plot on a site adjoining that which is marked green; that is to say, the main Admiralty buildings?—Yes; there would be no difficulty in finding a corresponding area provided the buildings were built at an angle.

And that would place the house built for the First Lord, if it were used for that purpose, together with the buildings where the offices were situated?—Yes; the residence would then be in the main building instead of in a detached one.

And might be made to form part of the façade of the main building architecturally?—Yes.

However, there is nothing to prevent the First Lord's house being erected on that space so as not to interfere, should it be thought necessary, with a more direct line from the Mall into Charing Cross?—There would be no difficulty in obtaining the First Lord's residence on the site.

*Mr. Walter:* Might not the same object be gained by slewing round this building, as at present laid out, in this way (*pointing to the map*); placing it more in a line with Carlton House Terrace?—There is not sufficient space in the angle to admit of that.

*Mr. Brand:* Would not the house that is proposed to be erected for the First Lord, in this spot marked pink, entirely prevent the entrance to the park from Charing Cross being made in a straight line?—It would prevent a handsome entrance from being made as it stands now; the entrance would be comparatively narrow, and would not be straight.

Could not this ground be utilised that is marked with red dots at the corner of the proposed Admiralty building?—To a certain extent it could, but it would probably injure the back lights of some of the buildings now there; for instance, Messrs. Drummond's bank has lights at the back, and those lights would probably be affected by the erection of a high building parallel to that bank.

In the original plan before the committee last week, was it not proposed to take half of Messrs. Biddulph's bank?—Notice was given to take a portion of Messrs. Biddulph's bank at the back, but not a portion of the main building; it was proposed to take a portion of a much lower building, having its frontage in Spring Gardens.

As compared with the original plan then, the space has been reduced?—No, it has not been reduced in this plan at all.

*Mr. Gerald Noel:* Could you tell the Committee when Messrs. Biddulph's bank was completed?—I should think it must be about six or seven years ago.

*Mr. Rylands:* With regard to this proposed entrance, 60 feet wide, which, in the plan submitted to the Committee, crosses the corner of the building marked pink, would you be able to draw it in a straight line, 60 feet wide, the whole length of it taking off part of the building without any serious inconvenience in regard to your plan?—Yes, I think so, by shortening the pink building to a certain extent.

*Chairman:* That we propose to do?—Yes.

That building is about 10 feet longer than was originally contemplated, and by reducing it 10 feet it would make the whole road 60 feet wide, should it be thought necessary to have a road entering the Park at that width?—Yes.

Not absolutely in a straight line, but nearly so?—Very nearly. It is no longer possible to obtain a straight line there, because of Drummond's new bank; you cannot get a wide entrance perfectly straight with the Mall now, unless you take that bank down.

*Mr. Rylands:* Following up my question put just now, you would get an entrance 60 feet wide, and which would go into the Mall, without any disadvantageous appearance?—I think so.

And would you recommend that, in preference to the alternative scheme which has been suggested, of putting this red building alongside the main Admiralty building?—No, I do not think I should. I should almost prefer the main building to be erected at an angle, and to remove the pink building altogether.

Then you would prefer that the new part coloured green for the proposed Admiralty should be increased by a certain amount of building, to take the place of the small plot coloured pink?—As a matter of design, I certainly should.

*Chairman*: But it would interfere with the façade on that side, would it not?—Yes, it would to a certain extent; but I do not think it would be seriously objectionable.

But if it were intended for the residence of the First Lord, it would not be so desirable a position, would it?—You would not be able to make any particular part of the main design appear to be a residence apart from the offices. The residence would then simply have to be embodied in the main building.

*Mr. Arthur Arnold*: You are aware perhaps that Mr. Childers gave evidence to the effect that it did not appear to him desirable that there should be a residence for the First Lord?—I am not aware of that.

*Mr. Rylands*: Would you look at this plan (*pointing to it*)? The proposal you have just been answering me about is the one which would propose a line running through the corner of the plot marked pink, and so getting into the Mall with a turn; is there any objection to making the line more straight—that is to say, carrying it from here (*pointing*), just to bring it along parallel, or rather exactly opposite, to the line of the Mall; that would, of course, destroy the pink building altogether?—It would destroy it.

Would there be any objection to that?—There is no objection, except that you lose a certain amount of building space.

*Chairman*: You lose 9,000 feet, in fact?—Yes.

*Mr. Rylands*: But if you were to take the red building and attach it to the Admiralty, would you not make up for that loss of space?—To a certain extent I think we should; but the plan would not be nearly so convenient as the present arrangement of the proposed building.

I thought you said just now that you preferred the buildings provided for in the red plot being attached to the Admiralty main building?—As a design for a handsome entrance to the Mall, I do; but the plan would not be so convenient as regards the offices.

*Chairman*: Looking at the façade (*pointing*), it would not look well if this corner was not a right angle, but a different angle, so as to make the building in a line with the entrance to Charing Cross?—I prefer it as it is as a plan; but having regard to the general effect of a building erected there, if the entrance be a wide and handsome one, I should say, take up the general line of the opening into the park.

But then it would be open to this objection, would it not, that as looked at from the Mall, the building would not be a rectangular one?—That difficulty could be overcome.

*Mr. Rylands*: Just now you gave the dimensions of the proposed new court, the smaller court of the Admiralty, on the site marked "Buckingham Court"?—Yes.

Would you repeat, if you please, the area of that court?—I think I said 100 feet by 60.

Now, referring to this small court of the Colonial Office (*pointing to it*), what are the dimensions of that court?—The dimensions of that court are 70 feet by 50.

Then the area of the court in the Admiralty over the site marked "Buckingham Court" would be considerably in excess as compared with the area of the Colonial Office court?—Considerably.

Would you be kind enough to state how many square feet?—The proportion would be about as 6,000 to 3,500.

Then it is really not very far from double the space?—Very nearly double.

In making that comparison, have you made an allowance in the Colonial Office court for a considerable projection which appears there, in the form of what appears to be a bay?—I have not taken out the bay, and I took the longest side of that court; it is not square.

But then does not that make the Colonial Office court appear larger than it ought to be taken as being?—There is a deduction from that by the projection you speak of.

If you take the longest side in multiplying, with a view to find the area of the Colonial Office court, would you not make the area appear to be greater than you would do if you took the shortest side?—Yes; I have not made any deduction for the projection into that area, which is not a high structure.

But I want you to make the deduction; I want to get the actual area of the Colonial Office court.—I should have to take it in detail to find it.

If you had made the deduction for this bay in the Colonial Office court, is it not the fact that the area would have been less than the estimate of the size of the court which you have just given? Probably a little less, but I cannot say exactly, unless I take out the actual dimensions. I think the figures which I have given you are about correct, relatively—as 6,000 is to 3,500.

*Sir Henry Selwin-Ibbetson*: You are aware that the office rooms in the Colonial Office round this court are of a very great height themselves internally?—They are.

There would be no necessity requiring that the rooms in the new Admiralty or the War Office should be of that height, which has been very often stated, has it not, to be very inconvenient for office purposes?—I think there is a waste of space in the present Home Office and Colonial Office.

Consequently you could get the same accommodation round

these courts in the new buildings with very much lower rooms, and the courts would give greater light therefore in the rooms?—In the proposed new buildings it would be so.

And therefore this court in your plan, which is larger in itself than the Colonial Office court, would be still larger for purposes of light, should the rooms be brought down to the ordinary proportions of living-rooms instead of being of the height that they are in the Colonial Office and the Home Office?—Yes, if the number of floors be the same in the new building as it is in the Home Office and the Colonial Office.

You would get a proportionate increase of light in your courtyard in consequence?—Yes.

And at the same time the building so reduced in height as a general building would probably accord more with the height of the Horse Guards, which would be the centre of the whole architectural design?—I think the total height of the proposed new buildings would require to be equal to that of the Home Office at least.

Notwithstanding that you reduce the height of the individual rooms on each floor, you think that the total height must be equal to that of the Home Office?—Yes, for this reason, that some of the rooms at the top of the Home Office are very bad indeed, and ought to be higher than they are.

*Mr. Gerard Noel*: They are useless, are they, in fact?—Some of them are now being used, because I have put skylights into them at the back; but they were so arranged that they could not be properly lighted from the front.

*Sir Henry Selwin-Ibbetson*: In your opinion you could not diminish the actual height of your new building, though you might alter the proportion of the different floors?—No. There is one observation which I think I ought perhaps to make to the Committee, and that is, that although there is a block plan shown upon the site, I have not considered myself by any means committed to that actual appropriation of the land; it is a mere plan for the purpose of showing how much building area can be obtained approximately upon the site.

*Chairman*: It by no means commits the department to that special plan?—Certainly not.

But when we come to consult with the architect, it may be that some better disposition of the site may be discovered?—Yes.

All that that plan proposes to show is how that land may be utilised, and how out of it a certain building area may be obtained?—Exactly so.

The Committee-room was cleared. After a short time the parties were again called in. The Chairman stated that the Committee were of opinion that the preamble of the Bill had been proved.

## BUILDERS' BRASSWORK.

ALTHOUGH most people have some notion of the use which is made of brasswork in the building and furniture trades, it is only from such evidence as is furnished by the colossal catalogue issued by Messrs. Cartland & Sons, of Birmingham, and 40 Holborn Viaduct, E.C., that the extent and importance of this class of work can be realised. The volume, we may say, contains about 600 pages of plates, which are crowded with engravings of the articles manufactured by the firm in Birmingham. Messrs. Cartland & Sons produce many patent specialties which are well known, including Andrews', Peacock's, and Pugh's patent lock furniture, Beanland's patent quadrants, Thorpe's ventilating sash-fasteners, Leach & Holland's window ventilator and fastener, Hatton's blind furniture, Scott's sash wedge, the security casement stay, and helical climax, reliable, and Smith's door springs. But, in addition, they manufacture every kind of article in brass which a builder or cabinet-maker requires. An inventory of the different classes of goods would occupy at least a page. They supply, among other things, screws large and small, fancy nails for mantels and furniture, hooks, rings, castors, plates, escutcheons, knobs, plain and elaborate stair-rods, curtain-poles, wardrobe hooks, brackets, picture-rods, cornices, &c. Shop-window fittings form a section by themselves. There are many kinds of sconces and banner-arms. For India there are special articles for punkahs and windows, and the brasswork for ships' cabins occupies several pages. The hinges range from tiny butts to swings for the heaviest kind of doors in banks and public offices. Door plates, knobs, knockers, and handles are illustrated by hundreds of examples suitable for all styles of buildings, including Queen Anne, Renaissance, Gothic, &c. There is no firm in this country which has given so much attention as Messrs. Cartland to window fastenings, and in the catalogue the varieties need fifty pages of plates to be exemplified, many of them being ingenious pieces of mechanism. Bells, cranks, levers, and pulls also occupy a large part of the catalogue. When the vast number of the articles is remembered and the differences of taste which require to be considered by a manufacturing house, it is astonishing how little is to be found among Messrs. Cartland's productions to which the most fastidious could object. Excellent designs are to be found on every page, and it is needless to say that for quality the goods of the firm are universally esteemed.

## ST. PAUL, MINNESOTA.

FEW American cities during the past decade have made (says a writer in the *Times*) more solid progress than St. Paul and Minneapolis, the twin capitals of Minnesota, on the beautiful banks of the noble Mississippi, situate eight miles apart, but growing nearer to each other year by year. Between the two cities, which each muster their 60,000 people, there is mutually beneficial rivalry. Minneapolis boasts of her ceaseless water-power, her great milling and lumber interests, her wide sweep of well laid-out level avenues and streets. St. Paul prides herself on her picturesque undulating site, on her bluffs, commanding magnificent views of hill, wood, and river, of her terraces and ravines. She arrogates precedence not only as the State capital, but as a great commercial centre, building up a large and varied wholesale business enterprisingly pushed hundreds of miles north and west. Such development is more striking when it is remembered that in 1834, when General H. H. Sibley, one of the oldest and most esteemed citizens, first visited the Mississippi, not a white man or a house was to be seen where St. Paul and Minneapolis now stand. The beautiful bluffs, occupied by sumptuous villas, were the hunting and fighting grounds of the Sioux and Chippeway Indians, whose bones, with those of the other inhabitants, the buffalo and the elk, are often found in excavating for streets or buildings.

Town improvements are actively prosecuted in St. Paul, and more carefully and honestly looked after than by some municipalities. Water and sewage have been successfully arranged for; gas is still in the hands of a private corporation. Attention is shortly promised to the execrable muddy streets and roads, which might be readily made and kept in good repair with the admirable stone abundantly found in the cliffs and elsewhere in the neighbourhood. Convenient tram-cars run in many of the thoroughfares. New public offices, a commodious post-office, and a large, handsome passenger dépôt, common to all the railroads, have just been finished. The railroads are also building blocks of offices, and several are putting up engine and freight-car repairing and manufacturing shops, which, when in operation, will give employment to upwards of 1,000 men. To assist these projects the Municipality has spiritedly given the companies tracts of land for their sites; the St. Paul and Sioux city, for example, had a grant of 40 acres, worth upwards of 100*l.* an acre, presented gratuitously. Extending business has stimulated building operations. Upwards of 1,000 buildings of various sorts are stated to have been put up this summer; masons were in such demand that their wages advanced to 5 *dols.* per day; next spring is expected to bring still more work. Building stone is abundant and varied; a beautiful limestone is quarried in and around the town; the Ohio limestone is much used; a pleasant red-grey magnesian limestone is brought 80 miles west from Kasota; beautiful, well-pressed, small red bricks are sent from St. Louis, costing, however, 32 *dols.* per thousand; soft, rudely-made, home-made bricks of poor quality, but charged 10 *dols.* per 1,000, are used for inside work. Lime and cement—some of the latter all the way from the Medway—are dear. Recently built and in course of construction are numerous stores and warehouses of stone and brick, usually with iron columns supporting the floors, often ornamented with galvanised iron or zinc cornices; the timbers for floor-joists in some instances consist of 25 feet 16 inch red pine plank, 3 inches thick, set edgewise, 12 to 13 inches apart; the roofs are generally flat, covered with iron plating; lighter buildings, also flat-roofed, are covered with tin plate, over which a coat of grouting is generally run. Other of the cheaper houses have the rough boarded roofs cheaply covered with four or five alternated coats of stout cartridge paper, between which are layers of tar, all lopped out with a thin coating of asphalt and shingle. For roofs with the pitch usually seen at home, the common roofing materials are shingles nailed on to rough boards, with an intervening coating of mortar, which lessens the risk of fire. The shingles six months after being put in are sometimes washed over with some tar solution which helps to preserve them; for the better class of more permanent buildings slates, costing fully double the price of shingles, are coming into more common use. Many, especially of the larger stores, are as substantial, thoroughly finished, and artistic in design as any in London or Liverpool. A good type of this street architecture is a warehouse for a wholesale firm being put up by Mr. E. F. Drake, built of stone and brick, ornamented with marble pillars, 278 feet by 86 feet, with six storeys and a basement, costing 200,000 *dols.*, and leased for 16 years at 8 per cent. on the outlay, the lessees besides paying all taxes and insurance.

Building sites in the neighbourhood of the railway dépôts sell almost at London prices, but every description of land and house property in the city has doubled in value in five years, and appears destined to do so again within the next five years. Prosperous merchants, tradesmen, and their employés must be housed. Villa sites, with commanding views, amid sheltering timber, on Summit or Dayton avenues, are as high as at Twickenham or Hampstead. Blocks, measuring 50 feet by 150 feet, realise 2,000 *dols.*, or one-fifth to one-fourth of the cost of a suitable handsome house placed upon them. Most of these villas have basements of stone or brick, are substantially and artistically carried up with timber, and kept nicely painted for preservation and effect in this bright

climate, dimmed or grimed only slowly by cloud or smoke. Here, as in some other American cities, much taste and variety are exhibited in the designs and finish of these timber villas. Of artisans' dwellings there is such dearth that many large firms have difficulty in keeping good operatives, and are desirous to guarantee for a series of years 10 per cent., and even more, to builders who will run up decent houses for their people. Dwellings even of this class, notwithstanding the high value of the sites, are generally detached or semi-detached; each man prefers to have his own plot, although he seldom makes the most of it or attempts to beautify it with shrubs or flowers. Artisans' and labourers' houses are almost invariably of timber, and cost, with six rooms, 600 *dols.* to 800 *dols.*, or about half the price of the more substantial corresponding English houses. Constructed of brick, they would at present, at St. Paul, be 33 per cent. higher. Timber cottages last in good repair for twenty years, when it is presumed that the sites, doubled in value, will be required for other purposes and the buildings may be profitably removed. Gardens are seldom attached even to suburban cottages, but are becoming more appreciated, especially by artisans.

## THE STRENGTH OF TIMBER.

SOME experiments on the strength of wooden posts have been conducted by Professor Lanza, of the Massachusetts Institute of Technology, with the aid of a testing machine belonging to the United States Government. The first columns tested were of oak, and had been used in different mills. The posts that were received from mill No. 1 were seven in number, had been in service about six and a half years, and were removed because they were deemed unsuitable. They were all about 12 feet long, about 6½ inches in diameter at the larger end, and 5½ to 6 inches at the smaller end. They were all bored, and the boring was excellent. The load they had sustained was estimated by one of the gentlemen connected with the mill at about 10,600 *lbs.* per column, beside the weight of snow in winter. They were provided at the top with a maple cap surmounted by an oak base on which rested the next column above, or the roof timbers.

Of these columns three were tested between the platforms of the machine, the ends being brought to an even bearing. These broke under loads giving a breaking strength per square inch of cross section (= total load divided by area of smallest section) of 4,602, 6,032, and 4,682 *lbs.* The remainder had the maple cap at one end and the oak base at the other, these resting against the platforms of the machine, and the ends not being specially brought to an even bearing. These broke under loads giving a breaking strength per square inch of 2,943, 3,263, 4,223, and 3,450 *lbs.*

It is to be observed that in only one case does the crushing strength per square inch reach 6,000 *lbs.*, and also that in the case of the last four, when the maple caps and oak bases were used, and the ends were not squared up, the strength averages less than in the first three.

The ten columns from mill No. 2 were taken from the worsted department of the Pacific Mills at Lawrence, where some alterations were being made. Columns A, B, C, D, E, and F were from the first floor of the mill, and the remaining four, G, H, I, and J, were from the second storey. All were about 14 feet long, the first six having a diameter of 10½ inches, the last four of 9½ inches. A, B, and C were tested directly between the platforms of the machine without having the ends specially squared. They broke at 4,265, 3,880, and 4,984 *lbs.* per square inch respectively. D was similarly tested, but had ends squared up, and broke at 4,604 *lbs.* per square inch. E and F were tested with an iron base-plate at one end, and iron cap and pintle at the other, an arrangement the same as that used at the mill. They gave way under 4,662 and 4,838 *lbs.* respectively. Of these posts A was not straight, B had a winding grain, C was quite knotty and appeared shaky near the failure; D, E, and F appeared tolerably free from defects.

The posts G, H, and I were tested directly and without special squaring of ends between the platforms of the machine, and broke under 4,881, 3,433, and 3,981 pounds per square inch respectively. J was tested with pintle in the same way as E and F. It yielded under 3,266 pounds per square inch. These four posts appeared quite defective, owing to knots, bending, &c. All the posts from the Pacific Mills had been in use twenty-five years, and, assuming fifty pounds per square foot as the weight on the roof, and sixty pounds per square foot as the weight on the floor, there would have been a load on each of the first six of 46,400 pounds to 53,650 pounds, and on the last four of 36,800 pounds to 42,550 pounds. (The average load under which the first six broke was about 380,000, for the last four 250,000 pounds.) From mill No. 3 there was one old oak column of whose history nothing was definitely known. Tested between the platform of the machine it broke under 6,147 pounds per square inch.

These eighteen were all the old oak columns tested. It will be noticed that in two cases a strength of a little over 6,000 pounds per square inch is obtained, but that in no other case does the strength exceed 5,000 pounds, and that in one case it fell as low as 2,943 pounds.

The next set of posts consisted of two white oak posts, left untested from November 1881. The first, tested with even bearings against platforms of machine, gave a crushing strength of 3,219 pounds per square inch. A short block of much better quality gave 4,450 pounds per square inch. The second post, which was also a poor one, was tested with an eccentric load ( $2\frac{3}{4}$  inches out from centre). Its diameter was 10.95 inches. It broke under a total load of 170,000 pounds, whereas it would have been 276,480 if it had possessed a crushing strength of 3,000 pounds per square inch.

The remaining blocks and posts were of yellow pine, and were each four in number. A square yellow pine post, about 13 feet long and 10 inches on side, with pintle at one end, broke under 5,220 pounds per square inch. A second square post, same length and about 9 inches on side, tested with one flat end, one rounded end, and vertical axis  $2\frac{1}{4}$  inches eccentric, broke under 280,000 pounds total load. Two yellow pine blocks, each 2 feet long, of square section, respectively 9 inches and 10 inches on side, broke under 5,950 pounds per square inch and 5,452 pounds per square inch. A yellow pine round post, 12 feet long and 8 inches diameter, tested with one flat and one rounded end, had an ultimate strength of 4,662 pounds per square inch. A block 2 feet long, cut from end of this, broke under 3,604 pounds per square inch. A second round post, 14 feet long and 7.9 inches diameter, tested with flat ends, broke under 4,254 pounds per square inch. A 2-foot block, cut from the end of this, broke under 4,892 pounds per square inch. A third round block, 2 feet long and 10.9 inches in diameter, broke under 4,450 pounds per square inch.

Some large spruce beams, broken transversely, varied in size from 4 inches by 12 inches and 20 feet long to 2 inches by 7 inches and 7 feet long. The average modulus of rupture for spruce as obtained from these is about 4,623 pounds per square inch. These are the first experiments made on full-sized beams, and it is, therefore, of interest to compare them with the figures given by various authors and now in general use among engineers:—

Hatfield gives for spruce	...	...	...	13,365	pounds
Laslett	"	"	"	12,210	"
Rankine	"	"	"	11,100	"
Rodman	"	"	"	6,100	"
Trautwine	"	"	"	8,100	"

The latter advises a deduction of one-third for knots, &c., which would leave 5,400 pounds, a result greater than all but two given by any of the tests described.

### DRURY LANE THEATRE.

THE annual meeting of the proprietors of the Drury Lane Theatre was held on the 13th inst. Mr. T. Rawlinson presided, and read the annual report, which stated that the gross receipts, including the balance of 1,362*l.* remaining on June 30, 1881, and 1,000*l.* withdrawn from the deposit account, amounted to over 10,997*l.* The payments reached a total of 9,618*l.*, including a sum of 1,360*l.* for rent paid to the Duke of Bedford, and 3,700*l.* paid to the trustees of the New Renters. Captain Shaw had inspected the theatre, and the Metropolitan Board of Works had made certain requirements for structural alterations. The committee had availed themselves of the right to refer these to arbitration.

Mr. C. J. Phipps, F.S.A., also read a report, in which he stated that many alterations had been made during the past year for the purpose of securing the safety of the public. The partition separating the stage from the auditorium was formerly of boarding only. It had now been covered with a composition of plaster of Paris and coke breeze from the level of the stage floor to the slates in the roof, thereby preventing, in his opinion, the spread of a fire from the upper part of the stage to the roof over the auditorium, for a period sufficiently long to allow the audience to leave the theatre. All the barriers to the several galleries, staircases, and to the pit entrance had been re-arranged and made to work easily. A new exit had been made from the stalls, and the dress circle had been fitted with arm-chairs having lifting seats. The New River Company had made heavy demands as to new fittings for the water service, but these being found necessary, had been carried out. The central chandelier in the theatre was now lighted by the electric spark, the battery being worked by the man at the prompter's box on the stage. This was much more safe than the old system of lighting. The present lessee had well fulfilled his contract, and had kept the place in a good state of repair. The Chairman, in moving the adoption of the report, referred to the statements made in the report of the architect, and said the wall referred to by the latter was considered capable of resisting a fire breaking out on the stage for twenty minutes, and as the theatre could be cleared in eight minutes, there was no doubt, if that were the case, that the wall would be of great assistance in an emergency. The new stall corridor which had been constructed would prevent the cross currents of those from the pit and the stalls meeting in getting out. Alterations in the barriers had been made, in order to facilitate the egress of the public. Captain Shaw, who was sent to inspect the theatre in consequence of a panic arising through the disaster at Vienna, had

reported that the whole of the exits were very satisfactory as far as the lower gallery, and with regard to the upper gallery, though in his opinion it could be cleared in three minutes ten seconds, he thought there should be a second gallery exit. The Committee were of opinion that this was altogether unnecessary. Some of Captain Shaw's suggestions were eminently impracticable; indeed, so much so, that the Metropolitan Board of Works would not adopt them. He suggested a thick masonry wall from the lowest basement up between the auditorium and the stage, and reaching to a height 20 feet above the roof. Practical men said that that would form an admirable trap for the snow in winter, and that a wall rising three feet only above the roof would be much better. In the middle of the "snow tank" Captain Shaw suggested that there should be over the stage a ventilator of a size occupying one-tenth of the snow tank. If such a tank were to be built the only effect would be to send down such a draft as would flap the scenery about, and cause a great deal of danger. Suggestions made as to handrails on the staircases the Committee would do all they could to carry out. Amongst other impracticable things it was suggested that the whole of the scenery should be removed to a distance, and scene-painting and carpentering carried on elsewhere. The lighting arrangements were spoken of by Captain Shaw as very satisfactory, especially in separate sets of meters being provided for the front of the house and the stage, so that an accident on the stage would not put the house in darkness. With respect to the time which would be taken in clearing various parts of the theatre, they were given as follows:—Pit, 5 min. 30 sec.; stalls, dress-circle, and first circle, 8 min. 20 sec.; lower gallery, 4 min. 30 sec.; upper gallery, 3 min. 10 sec. That was when people went out in the ordinary way; but if, unfortunately, there was any panic they would try to leave much more rapidly. Panic was a thing it was difficult to guard against, and it had been found that every one, when a panic did arise, rushed for the door by which he came in, and would not trust himself through a strange door. He (the chairman) would suggest that in the upper and lower galleries they should post notices telling people how long it would take to clear the theatre, and asking them to go out by a certain way. No fire would reach the gallery in three minutes and ten seconds.

### THE RUSKIN MUSEUM AT SHEFFIELD.

A MEETING was held on Wednesday in Sheffield in favour of enlarging and extending the St. George's Museum at Walkley.

Mr. J. D. Leader said it would be remembered that at a meeting held about a year and a half ago a small committee was appointed to confer with Mr. Ruskin as to his views about the museum, but partly owing to the health of Mr. Tozer, who convened the meeting, and partly owing to the state of Mr. Ruskin's health, the matter had been in abeyance for a long time. It was felt, however, in many quarters that the matter should not be allowed to sleep, that something should be done, and Mr. J. F. Moss, with the sanction of Mr. Tozer, had been good enough to take the matter in hand and renew the correspondence with Mr. Ruskin. The result was the meeting then assembled. Mr. Ruskin had been kind enough to come down to Sheffield for the purpose of conferring with them on the subject.

Mr. Bagshawe spoke of the necessity of putting the matter upon a safe legal footing, so that in case of any change in St. George's Guild the museum and its contents should not be liable to dispersal or removal from the town.

Mr. Ruskin explained that his original idea had been a very modest one, namely, to enlarge the present museum at Walkley in the plainest possible manner, but as gentlemen seemed to think it desirable to change the site to one more generally convenient, he was quite ready to place himself in their hands on that point. In consequence of this he had put himself in communication with Mr. Robson, the architect, who had prepared under his advice some plans, which he laid on the table. The style of architecture that he thought most suitable was that which had prevailed in Florence for so many centuries, where ornamentation was produced by the various colours of the material used. Mr. Robson had suggested that in the first instance one section only of the plan should be carried out, and he roughly estimated the cost at 5,000*l.* About the security of the property he was quite ready to agree to any security that Mr. Bagshawe and legal gentlemen in the town might deem necessary. As to the management, he proposed to retain that entirely in his own hands. By management, he said he meant, first arrangement; and secondly, the method of making the collection useful to the student.

A cordial vote of thanks was accorded to Mr. Ruskin for his attendance, and a committee, consisting of Messrs. William Smith, Benjamin Bagshawe, Ald. Pye-Smith, Mr. J. D. Leader, and Mr. Moss was appointed to draw up, in conference with Mr. Ruskin, a definite scheme to be submitted to the public, and Mr. Ruskin said he would place his services entirely at the disposal of the people of Sheffield with the view of attending a public meeting and explaining his intentions.

## BELGIAN IRON.

WE have received the following communication from the Belgian Société Anonyme de la Providence in reference to the letter and table of results of experiments by Mr. Dawney which were published in *The Architect* of February 18, 1882 :—

As the contents of that letter are of such a nature as to throw discredit on Belgian iron imported into England, we cannot pass it under silence. Mr. Dawney quotes several tests made on same, and comes to the conclusion that Belgian products are of an irregular make and mediocre in quality. We must protest against the assertions of your correspondent, which are in great contradiction with industrial facts coming daily under the notice of the public.

For these last twenty years the Belgian ironworks have acquired numerous connections of the highest standing in Great Britain, owing to their moderate prices and the regularity of their products, now so well appreciated by the railway companies and other large consumers.

In fact, it is very well known that in many of your public works Belgian iron is being used to a great extent, for railway companies and engineers are receiving large parcels of same every week, and the iron is submitted to severe tests before being accepted.

If the arguments of Mr. Dawney were serious, how could it be explained that Belgian plates are used for the manufacture of iron bridges, engines, tanks, &c., &c., without any complaint? Why does the Russian Government use it in its dockyards? How is it that your Indian Government has been importing such large quantities of Belgian iron for a number of years? Why do the Governments of Holland and Italy place their orders on the most severe terms in preference with Belgian works? And, finally, how does Mr. Dawney explain that English merchants are now the *largest* buyers and exporters of Belgian iron?

Besides, the arguments of that gentleman are completely annihilated by the good results of Belgian iron tested in England. As on instance, we may add that the Providence Iron Company of Marchienne-au-Pont guarantee their iron to stand the following tests :—

Quality No. 2	...	20 tons	tensile strain to the square inch
" 3	...	22	" "
" 4	...	24	" "

The same company have recently supplied iron girders for your Colonial Government, and the average of eighteen samples tested came to 24 tons per square inch. Without, however, always guaranteeing such high results, the Providence Iron Company offer to do at their works any tests that may be desired by all traducers of Belgian iron.

## THE EXPLORATION OF ASIA MINOR.

THE following circular is about to be issued under the sanction of the Council of the Hellenic Society, advocating the support of a project for the exploration of Asia Minor :—

"Mr. W. M. Ramsay, B.A. Oxon, has been the holder for the last three years of the Travelling Studentship in Archæology, established in connection with the university of Oxford by an anonymous friend of archæological study and research. As holder of this studentship, Mr. Ramsay has been able to visit and explore many of the less known parts of Asia Minor, with results which appear from the articles he has contributed to the *Journal of Hellenic Studies*, and other periodicals. The value of his explorations has also been recognised by the German Archæological Institute at Athens, of which he has been elected a corresponding member.

"With the view of enabling him to continue the work he has begun, an Oxford College is prepared to elect him to an extraordinary fellowship, to be held for a short term of years, on condition of his applying himself to the study of Greek archæology. It is clear, however, that the income of a fellowship (200*l.* a year) is not sufficient to enable the holder of it to travel, least of all in a country like Asia Minor.

"Under these circumstances it is suggested that a fund of 500*l.* should be raised in aid of Mr. Ramsay's work. The Council of the Hellenic Society have resolved to recommend the case as one deserving the support of all those who are interested in Hellenic studies. The money raised for the purpose will be placed in the hands of a committee appointed by the subscribers, who will be charged with its administration."

Mr. Newton, in presiding at the general meeting of the Hellenic Society on June 15, called special attention to Mr. Ramsay's work, and expressed the hope that so staunch an explorer would not be checked in his career for want of effective support. He pointed out that the French, the Germans, and the Americans had all of late been prosecuting very successful researches on Hellenic soil, while England was falling behind in the race. A sum of 100*l.* has already been promised towards the fund, and further contributions may be sent either to Mr. G. A. Macmillan, at 29 Bedford Street, Covent Garden, or to Messrs. Robarts, Lubbock & Co., Lombard Street, to the account of "The Asia Minor Exploration Fund.

## THE PRESTON LIBRARY AND MUSEUM.

THE plans for the intended Free Library, Museum, and Gallery of Art, which is about to be erected at Preston (and the foundation-stone of which will be laid by the Duke of Albany at the approaching Preston Guild in September next) are being prepared by Mr. James Hibbert, architect. The Harris Trustees have granted 50,000*l.* for the erection of the building. Mr. Hibbert, who has erected several churches and other public buildings in Preston, was instructed by the trustees and the free library-committee to visit the chief public libraries, museums, and art galleries in England, as well as the libraries and museums on the Continent, with the view of reporting to the trustees and the committee the character of the building which it would be desirable to erect. The new building will be Gothic in style, in order that it may harmonise with the Town Hall, designed by Sir Gilbert Scott, and which is in the immediate locality. The building will cover a ground area of about 25,000 superficial feet, the site having been given by the Corporation, at a cost of 25,000*l.* In order to obtain the ground the Corporation have had to purchase a considerable amount of property, which will admit of the construction of two new streets, of 50 feet in width each, on the north and south sides of the Library, which will be completely isolated from the neighbouring buildings, and will have four distinct frontages. The principal frontage will be on the west side of the building, facing the open space known as the Market Place, and will be at right angles with the north frontage of the Town Hall. This frontage, as well as the east front facing a spacious new thoroughfare called Lancaster Road, 60 feet in width, will be 130 feet long; the north and south frontages, facing the two intended new streets, being 170 feet in length. In addition to the contribution of 50,000*l.*, the estimated cost of the building, it is understood that the Harris Trustees have agreed to expend 5,000*l.* in books for the library, on the completion of the building; 5,000*l.* in purchasing examples of the fine and industrial arts, and objects of scientific interest; and likewise to place with the Corporation a further sum of 10,000*l.*, on interest at 4 per cent., to be expended annually in additions to the reference library, museum, and art galleries.

## PUBLIC BUILDINGS IN IRELAND.

THE Report of the Commissioners of Public Works in Ireland states that the severe storms of October 14 and 21 and November 21, 1881, caused more or less damage to a large number of the buildings under the Board's charge, not involving any serious outlay at any one, but, from the number of cases to be attended to, and the wide area over which they were spread, there was necessarily a severe pressure on the executive officers. The following new works and alterations have been carried out during the year :—

New coastguard stations have been built at Ballynacourty and Ballyvaughan, and progress has been made with those at Portnoo and Tully, which will be finished during the current year. The conversion into barracks for the Royal Irish Constabulary of sundry bridewells which are no longer required for that purpose has been completed, except at Ballyconnell, in which case the change has been abandoned. The conversion of military barracks to a like purpose has been suspended for the present. The construction of a new barrack at Londonderry has been commenced; that at Galbally, county Limerick, is in a forward state, although there was some difficulty in getting a contractor to undertake the work. A new barrack has been completed at Clonmany, county Donegal. Temporary stabling has been supplied to 76 barracks, and additional portable huts have been supplied, increasing the number to 108.

The works at the Queen's Colleges during the year have been limited to the maintenance of the buildings, the furniture and fittings. A turret-clock and bell have been put up in the tower of Galway College. During the past year the erection of 45 national schoolhouses has been proceeded with at a total cost of 13,744*l.* 18*s.* 3*d.*, towards which the Board paid as grants two-thirds, or the sum of 9,163*l.* 5*s.* 6*d.*, the remaining one-third of the expense being met by local contributions. Various additions to and enlargements of schoolhouses, together with such structural improvements as providing timber flooring, wainscoting, tablet rails, eave gutters, &c., erecting porches, building enclosing walls and gates, have been carried out at 33 ordinary literary national schools, at a total cost of 1,627*l.* 1*s.*, of which the Board paid two-thirds, the remaining one-third having also been locally contributed. Besides this outlay, the Board have expended in new works and alterations, repairing and maintaining the Metropolitan (or Central) Model School Buildings, and the District Model, Minor Model, and Model Agricultural Schools, the sum of 7,886*l.* 1*s.* 10*d.*, and a further sum of 1,780*l.* 18*s.* 8*d.* for furniture for those buildings: on the ordinary literary national schools in charge of the Board a sum of 3,287*l.* 0*s.* 4*d.* has been also expended in works of maintenance and repair.

On October 30, 1880, the Irish Church Temporalities Commissioners, acting under the provisions of the 25th section of the Irish Church Act of 1869, made an order amending and consoli-

dating their former orders of October 27, 1874, December 16, 1874, and December 12, 1877. By that new order the number of buildings transferred to the Board for preservation as national monuments was increased from 119 to 137. Of this number the necessary works for arresting dilapidation and insuring future preservation have been carried out at 72, and partly at four more, which are in hand, while of those included in the order there are four at which either no trace of the building has been discovered, or so little as to leave nothing worth preserving, or which require no work of repair. There are 17 cases of pre-historic remains, such as stone forts and beehive cells, to which scarcely anything can be done beyond protecting them from further injury; and there remain 32 monuments, chiefly of small size, the repairs of which have not yet been commenced. The outlay up to the present time has been 20,556*l.* 17*s.* 8*d.*, and there remains to credit of the account—Three per Cent. Stock, 39,848*l.* 4*s.* 2*d.*, and a cash balance of 230*l.* 13*s.* 4*d.*

### LEGAL.

**Manchester Assizes (Nisi Prius Court).—July 18.**

(Before Mr. Justice NORTH.)

**HARWOOD & SON v. THE CORPORATION OF BOLTON.**

DEFECTIVE SEWERS.

This action was brought by Messrs. Harwood & Son, cotton spinners, to recover 147*l.* as compensation for damage which they sustained on the night of July 5, 1881, by the flooding of a cellar in which was stored a considerable quantity of yarn. This damage, the plaintiffs allege, was caused by the negligence of the defendants in not providing sewers that would carry away the surplus water after a heavy fall of rain. The chief contention of the defendants was that the rainfall was so excessive on the night in question that they could not be held responsible for the damage that ensued, and that therefore it ought to be considered the "act of God." An *employé* of the Corporation stated that he had gone along the sewers near the mill of the defendants and found them on an average 2 feet wide and 2 feet high. At one place they were 2 feet 6 inches high, and at another 1 foot 11 inches. Mr. J. W. Wardle, assistant surveyor to the Corporation, produced certain plans showing the levels and the capacity of the sewers in question. Mr. James Mansergh, C.E., stated that he had had twenty-five years' experience as a civil engineer, and had carried out sewage works in fifty or sixty towns in this country. The particular sewers in question were capable of discharging an inch of rainfall running off in an hour, which would be equivalent to a fall on the ground of 1½ inch in an hour. He believed the flooding of the cellar of plaintiffs' mill arose from an exceptional fall of rain, which, if he had been constructing the sewers, he should not have felt his duty to provide for. Mr. Robert Vawser, C.E., stated that exceptional rainfalls could not be provided for. It was not the practice for engineers to construct sewers capable of carrying off a fall of 1½ inch of rain in an hour, and he was of opinion there were very few sewers in any part of Lancashire or any other county that would carry off that amount. It was undesirable on sanitary grounds to make sewers larger than was necessary, and from his inquiries and examination he held that the sewers near the plaintiffs' mill were sufficient to carry off the ordinary heavy rains falling in the district. Replying to a question, witness said he had never known a system of sewers which would take off a rainfall of 2·03 inches in two hours, which it was stated fell on the night of July 5, 1881. Mr. James Farrar said he considered the sewers sufficient for the purpose for which they were constructed, and if he were called upon to draw up a drainage scheme he should never think of providing for such an excessive amount of rain as that which fell on the night in question.

The jury returned a verdict for the plaintiffs for the amount claimed, with costs. On the application of counsel for the defendants execution was stayed until November.

**Salen.**—The new Free Church at Salen, Mull, which has been designed in the Early English style of architecture, will be seated for 250, and is cruciform on plan, the nave being lighted by simple lancet windows in the sides; and in end opposite pulpit by a large three-light window with circular top filled with cinquefoil tracery; and the transepts by three-light lancets. All the windows will be glazed with tinted cathedral glass in lead quarries; the porch, with deeply-moulded arched doorway, will be near the north-east angle of nave. Over the junction of nave and transept roofs will be placed an octagonal *flèche*, the lower part forming a ventilator and the upper part a belfry. At the end behind pulpit will be placed the vestry and other accommodation. The walls will be built of the local whinstone, square-dressed, with dressings of white freestone. The roof principals will be exposed but plastered between, and the interior woodwork will be of pitch pine. The cost will be about 1,100*l.* The contractors are Messrs. McDougall & McDonald, Tobermory; and the architect is Mr. John C. Hay, Edinburgh.

### CHURCH BUILDINGS AND RESTORATION.

**Newcastle-on-Tyne.**—The foundation-stone of a church to be erected at the corner of Grainger and Blackett Streets has been laid. Plans for the building have been prepared by Mr. J. L. Banks, architect, London. The style is thirteenth century, the basis of the plan being a Greek cross. Accommodation will be provided for between 900 and 1,000 persons. There will be six entrances. The church will be surmounted by a large tower-*flèche*. Behind the church will be schools to accommodate about 800 children, having twenty rooms available for class-teaching. The buildings will be of stone. Mr. W. Scott, of Newcastle, is the contractor. The building will cost about 11,000*l.*

**Burton-on-Trent.**—A new Wesleyan chapel is to be erected in place of the present one in Byrkeley Street, which is found to be now too small. The chapel is to be erected on the present site, together with vestry, general schoolroom, an infants' room, and five classrooms. The chapel will seat 700 people, and the cost of the work will be about 2,200*l.* Mr. C. F. Underhill is the architect, and the contract has been let to Mr. H. C. Mellors.

**Ladybank.**—A new church erected in the Ladybank district of Collessie parish, Fifeshire, has been opened. The church has been built from the plans and designs of Mr. Walker, architect, of Circus Place, Edinburgh; Mr. Ogilvie, of Kirkcaldy, being the clerk of works. The church provides for the accommodation of 400 persons.

**Rawcliffe.**—The foundation and memorial stones of a Primitive Methodist chapel at Rawcliffe have lately been laid. The new chapel is being erected on a plot of land purchased from Mr. Creyke, M.P., from designs by Mr. Howdill, architect, of Leeds, the contractor being Mr. Enoch Meggitt, of Thorne. The building will seat 300 persons, and is estimated to cost 700*l.*

**Coventry.**—The foundation-stones of a Baptist Chapel in Queen's Road have been laid. The chapel is designed to accommodate about 800 persons. In the rear of the chapel will be school buildings. A chapel-keeper's house will be erected on the north-west side of the premises. The exterior of the chapel will be of pressed red brick, with bands, strings, tracery of windows and other dressings of stone; the interior fittings of the building will be of varnished pitch pine. The cost of land, chapel, schoolroom, class-rooms, and chapel-keeper's house, is expected to be about 10,000*l.* The architects are Messrs. G. & I. Steane, of Coventry, and the builder Mr. John Worwood, also of Coventry.

**Cobridge.**—The Catholic church here has lately been reopened after extension. A portion has been taken down and a new chancel added, the building being lengthened something like 30 feet. The old building would accommodate between 400 and 500, and additional sitting room has been provided for more than 100. The work has been done by Mr. E. Emery, of Cobridge, from the designs of Messrs. Goldie, Child & Goldie, architects, London. The new high altar has been supplied by Messrs. Harrison & Sons, of Dublin.

**Bath.**—The corner-stone of a new chancel to St. Stephen's Church, Lansdown, has been laid. A new vestry and organ chamber are also to be built. The new chancel will be 27 feet by 21 feet 6 inches; vestry, 14 feet by 17 feet 6 inches; organ chamber, 12 feet by 17 feet 6 inches. The chancel will have an apsidal end, and will be lit by three two-light windows. The additions are designed in the Decorated style to harmonise with the rest of the building, and the work is being carried out by Messrs. Morgan & Lovell, of Bath, from the designs of Mr. Wilcox, architect.

**Staverton.**—The parish church of St. Paul has been reopened after renovation. The church is large, and consists of chancel, nave, north and south aisles, tower, and porch. The aisles run the length of the church, and a perpendicular screen separates the chancel. The work has been carried out by Mr. Evans, of Paignton, under the direction of Mr. Ewan Christian.

**Sal.**—The foundation-stone of a new church has been laid. The style is Early English, and the material used will be brick with Yorkshire stone facings and Hollington stone dressings. The plans show a nave of 89 feet in length and 30 feet wide, and two aisles 89 feet by 12 feet, an organ chamber on the south side of the chancel, and clergy and choir vestries on the north. The spire will rise to a height of 130 feet. The nave arcade will be supported on polished Peterhead granite columns, with Yorkshire stone dressing, caps and bases. The seats and other joiners' work will be of pitch pine, stained and varnished. The church will accommodate over 700 persons, and will have a special extra exit. The architect is Mr. H. R. Price, of Cross Street, Manchester; and the contractor, Mr. James Herd, of Ardwick.

**Ebbw Vale.**—The opening of Cwm Church has lately taken place. The building, which is designed in thirteenth-century style, is capable of accommodating 400 persons. The cost of construction has been about 1,400*l.* Mr. Norton, of Old Bond Street, London, is the architect, Mr. Jones being the contractor.

**Levenshulme.**—The foundation-stone of a new Catholic church at Levenshulme has lately been laid. The church, which is to be

dedicated to Our Lady of Mount Carmel and St. Clare, is designed in Early English style, and the cost of erection, it is estimated, will amount to about 2,000*l*. Accommodation will be provided in the church for 150 persons. The work is being carried out by Mr. J. L. Ward and Mr. James Corcoran, builders, from the designs of Mr. H. E. Tijou, architect.

**Downside.**—A portion of the new church at the Benedictine Monastery and College, Downside, has been opened. The church when completed will measure more than 350 feet, the nave being 140 feet. The internal length of the eastern portion, exclusive of that nave, but including the easternmost bay of the nave, which is already built, will be 220 feet, the extreme breadth across the transepts being nearly 90 feet; clear breadth of nave and choir, 28 feet, and transepts 25 feet; internal height to the top of the groining in the centre of the building, 66 feet. The church will have a nave and choir as broad as that of Norwich Minster, considerably higher than the venerable cathedrals of Chichester and Lichfield, and higher in proportion than the neighbouring cathedral of Wells. The present erection consists of the centre of the complete church, being the crossing together with the north and south transepts and the tower (30 feet square) at south end of south transept, and one bay of the nave and choir with their aisles. This portion has cost 15,000*l*., and it is estimated that the cost of the entire work will be little under 100,000*l*. Messrs. Dunn & Hansom, of Westminster Chambers, London, and Newcastle-on-Tyne, are the architects, and the builder is Mr. J. Bladwell, of Bath.

**Teignmouth.**—The church at East Teignmouth has been reopened after considerable improvements, which have been carried out from plans prepared by Mr. R. Medley Fulford, architect, of Exeter. The church has also been re-seated with benches of modern pattern, sitting accommodation being provided for 847 persons. The work has been carried out by Mr. Robert Davis, of Newton.

**Leckhampton.**—A new mission chapel has just been opened at Leckhampton, Cheltenham, from designs of Messrs. Chatters & Channon.

**Stonehouse.**—Mr. Snell, architect, of Plymouth, has designed a pulpit for St. George's Church, Stonehouse. The design is Classic. On plan it is hexagonal, and is supported by six monolith detached shafts of red Ippelen marble, which rest upon black marble bases. The capitals carrying the body of the pulpit proper are of grey marble; above which is a red marble frieze relieved at intervals by bosses of Yealpton green marble. The pilasters in the upper part, like the columns below, are of Ippelen marble, and the whole is surmounted by a frieze in grey marble.

**Lytham.**—The enlargement of the parish church carried out by Mr. Saul, contractor, of Preston, from the designs of Messrs. Paley & Austin, has been completed. The work includes a new aisle at the north side, 80 feet long 32 feet high to apex, and 11 feet 8 inches wide, and a new vestry and organ chamber. The materials used are hand-made good hard bricks, old English bond, and Longridge stone for window bases, cornices, strings, copings, buttresses, and battlements, the new wing being entirely in keeping with the other portions. The roof is a plain span and covers the old as well as the new north aisle.

**Eastbourne.**—The new All Souls Church was opened on the 6th inst. The style is Lombard Byzantine, a development of the old Byzantine and later Romanesque, adopted in Italy towards the end of the sixth century. The subsoil being very bad, the concrete foundations had to be carried down 17 feet to 20 feet. The building consists of nave, north and south aisles, chancel, chancel aisles, apse, and tower, the latter connected with the church by a short arcade. The external dimensions are 127 feet by 68 feet by 51 feet to ridge of nave; internal ditto, nave, 86½ feet by 33 feet by 39 feet to plate, or 49 feet to top of open timber roof. The north and south aisles are each 75 feet by 13 feet by 18 feet to plate, or 26 feet to top of lean-to roof. The chancel is divided from the nave by an arch 24 feet wide, 37 feet high, and measures 19 feet by 33 feet by 38 feet to wooden ceiling. The apse, having a 12-foot radius, contains seven windows, with spherical stone vault over and a reredos in Caen stone. The north chancel aisle of 19 feet by 13 feet is arranged as a vestry, whilst the corresponding south aisle contains the organ by Messrs. Bishop & Sons. The campanile at the south-west corner is 16 feet square by 83 feet in height, and contains a clock with four faces by Messrs. Dent & Co., and a peal of five bells by Messrs. Mears & Stainbank. The materials of the church are Keymer bricks and buff bricks from Tamworth, with red and buff terra-cotta by Messrs. Gibbs & Canning, of Tamworth. Internally the walls are lined with Burham bricks, and the stone arcading is in white and blue Corsham. The latter, as also the pulpit, desk, font, and mosaics were executed by Messrs. Farmer & Brindley, of London. The handsome corona of 60 jets, the hanging lamps, and the pulpit rail, were prepared by Messrs. Hart, Son & Peard; the tile floors and writing by Messrs. Simpson & Sons; the iron railing by Messrs. Johnston Bros. The contractor for the general work was Mr. James Peerless, of Eastbourne, and the clerk of works Mr. Walter Peart. The total cost has been about 18,000*l*., and the whole of the work was carried out from the designs

and under the directions of Messrs. Parr, Strong & Parr, architects, London. An interior view of the building was published in *The Architect* of August 20, 1881.

## SCHOOL BUILDINGS.

**Bury St Edmunds.**—The memorial-stone of a new grammar school has been lately laid. The building will contain basement, ground-floor, and first and second floor. The ground on the east is 6 feet higher than on the west, and on this side the basement comes out of the ground. The basement floor contains, in the southern part, the great schoolroom, 50 feet by 24 feet, and 14 feet high. There is a classroom at both ends. There is no communication between this and the northern portion of the basement, which contains kitchen, scullery, larder, butler's pantry, house-keeper's room, servants' hall, cellars, &c. In the southern portion over the schoolroom there are on the ground floor the studies and classrooms, on the first floor the dormitories, as also on the second floor. Corridors connect these floors with the corresponding floors in the northern portion, where, on the ground floor, is the entrance to the master's house and his dining and drawing rooms, with the large dining-hall for the boys. Between these rooms and the school there is behind the dining-hall a lavatory and douche. On the first floor there is the continuation of the master's house, matron's bedroom and sitting-room, and other rooms for boxes, linen, &c., and higher up on the second floor are day and night nurseries, sick-room, attendants' room, baths, &c. There is a lift from top to bottom of the building. The materials of the building are red Suffolk bricks, with moulded string courses, labels over the windows, and raised panels under the dormitory windows. The roof will be covered with plum-coloured Broseley tiles, and the upper part of the master's house will be weather-tiled, half the bricks being plain and half ornamental. The architect is Mr. A. W. Blomfield, of London, Mr. Browning is clerk of works, and Messrs. Grimwood & Son, of Sudbury, are the contractors.

**Kidderminster.**—New Baptist Sunday-schools have lately been opened in connection with the Baptist Church. The new buildings have been erected at the rear of the church, and accommodation is provided for 600 children, at a total cost of about 2,400*l*. Mr. Ingall, of Birmingham, is the architect, and Mr. R. Thompson the builder.

**Cardiff.**—The foundation-stone of a Wesleyan Methodist School Chapel, on Crwys Road, has been laid, the site being sufficient for a larger chapel if required later. The building will be of Newbridge stone with Bath stone dressings, the style being Gothic. The plans are by Mr. J. P. Jones, architect, and the contract (amounting to about 1,500*l*.) has been taken by Mr. D. Davies.

**Cheltenham.**—New schools are to be erected at Cheltenham, from designs by Messrs. Chatters & Channon, of Birmingham and Cheltenham, which were recently selected in competition.

**Cost of School Buildings.**—At the opening of the Smedley Road Board School, Cheetham, on Wednesday, it was stated that the cost of school building in Manchester compared favourably with that of other localities. For instance, the average cost per child for schools in Bradford had been 20*l*. 15*s*. 8*d*.; London, 18*l*. 1*s*. 4*d*.; Sheffield, 16*l*. 6*s*. 9*d*.; Leeds, 15*l*. 10*s*. 5*d*.; Liverpool, 15*l*. 7*s*. 3*d*.; Birmingham, 14*l*. 6*s*. 11*d*.; and Manchester, 12*l*. 15*s*. 9*d*.

## NEW BUILDINGS.

**Tobermory.**—A new hotel is being erected at Tobermory island of Mull, N.B., for Mr. Caldwell, of Hanover Terrace, Regent's Park. It will contain a dining-room 42 feet by 20 feet, drawing and ante-drawing-rooms, billiard-room, commercial-room, parlours, thirty-five bedrooms, kitchen, and other necessary accommodation. Stable offices are to be erected adjoining. For the rubble work blue whinstone, quarried free near the site, is used, all the dressings being of red freestone from the island of Arran. The cost of the whole works is not expected to exceed 4,500*l*. The contractors for the various works are Mr. D. Fletcher, mason, Tobermory; Mr. W. Menzies, joiner, Oban; Mr. A. Warwick, plumber, Tobermory; Mr. D. Craigie, plasterer, Edinburgh; Mr. J. Renton, slater, Edinburgh; Mr. D. Small, glazier, Edinburgh. The style adopted is a modified form of Scotch baronial. The architect is Mr. John C. Hay, Edinburgh.

**Pathhead, N.B.**—Plans, prepared by Messrs. Campbell Douglas & Sellar, architects, of Glasgow, have been selected for the erection of a new public hall at Pathhead. The hall will be 70 feet long by 44 feet wide, and will accommodate on the floor of the building 684, and in the gallery 120. Provision is also made for an adjoining reading-room, library, and billiard-room. The hall will be well lighted from the range of five windows on each side of the building, and by a large window in the gable. The style will harmonise with the surroundings, and the architecture of the district. It is estimated that the total cost of the building, including site, will be about 3,000*l*.

**Torquay.**—The foundation of a sanitary hospital to be erected on the Newton Road has been laid. The building, when completed, will provide accommodation for the treatment of twenty patients, in six wards, four wards containing four beds each, and four single-bedded wards, but at present only half the number of wards are being built. The plan takes the form of the letter H, and consists of two blocks of ward buildings connected by an open corridor. In the centre of this corridor is the administrative block, and in the rear are the single-bedded wards. The larger ward buildings will consist of two wards, with beds for four patients; nurses'-room, with windows overlooking the wards; bath-room, &c. The single-bedded wards are arranged in two isolated blocks, each block containing two wards, with nurses'-room between and overlooking them. There will be two detached buildings in the rear of the main premises, one comprising wash-house, ironing-room, drying-closet, and disinfecting chamber, and the other a mortuary and ambulance shed. Bricks will be used for the construction of the building. The architect is Mr. Ernest Turner, of London; and Mr. W. Trevena, of Plymouth, is the contractor.

## ENGINEERING WORKS.

**The New Bridge over the Lea.**—The Hackney Board of Works have at last instructed their General Purposes Committee to proceed with the erection of the long-talked-of new bridge over the River Lea, at Temple Mills. Some difficulty was presented by the occupiers of the contiguous land, who required the Board to fence in the marshes, and the lord of the manor threatened an injunction unless efficient approaches were made. To obviate these obstacles the bridge is to be constructed nearer the present ford and further from the owners' rights than originally contemplated. The bridge will form a direct access from Hackney to Leyton and other important places on the Essex side of the river, which can only be safely had now by a long, circuitous journey for vehicular traffic round by Lea Bridge Road on the north and Mile End Road and Bow on the south. The Metropolitan Board of Works will contribute a moiety of this much-needed improvement.

**Wick.**—Plans for the improvement of the harbour have been adopted by the Pulteney Harbour Trustees. The works include an extension of the south breakwater 600 feet, the north breakwater 700 feet, deepening and refacing existing harbours, new harbour on north side of the present north pier, including the widening of the present north pier, the boat basin with its quays, and the embankment; a new bridge, a new north harbour, dredging, &c. The cost of these works, setting aside a sum of 8,000*l.* for contingencies, is estimated at 110,000*l.* The plans have been prepared by Mr. Barry, C.E.

**Ayr.**—Works of improvement at Ayr Harbour have been decided on by the Harbour Trustees. It has been resolved to extend the south pier at a cost of 5,600*l.* It is proposed to drive piles round about, and to fill the space between this and the present pier with concrete. The new pier will be 16 feet wider, or double the width of the present. The contractor for the work is Mr. Lane, of South Shields.

## GENERAL.

**Dr. C. W. Siemens, F.R.S.**, has been elected Chairman of the Council of the Society of Arts for the ensuing session.

**Mr. Harris**, of Dundee, has offered to defray the cost of a plan of ventilating and heating the High School, Dundee, which will amount to 1,500*l.*

**Messrs. Heaton, Butler & Bayne** have completed a stained-glass window for a music-room in Christchurch, New Zealand, which will be on view on Monday next at their show-room.

**Mr. Silvanus Trevail** has prepared plans for a post-office and dwelling-houses to be erected on the site of the dilapidated buildings in Honey Street, Bodmin, which are to be pulled down. Mr. S. Lang, of Liskeard, is the contractor for the work.

**Messrs. Edmundson & Co.** have obtained the contract for lighting the National Exhibition buildings in Dublin, which will be opened on August 15.

**Messrs. Lander & Bedells**, of 6 John Street, Bedford Row, were appointed the Surveyors to the London Estate of the Harpur Charity, Bedford, on the 13th inst. The number of candidates who applied for the appointment was between 90 and 100. In the final vote Mr. S. Flint Clarkson, of Great Ormond Street, was second. The estate in question is between Bedford Row and Southampton Row, Holborn, and consists of some 300 houses, with a rental of about 14,000*l.* per annum.

**The Dean of Bangor** has made an appeal for funds to complete the principal tower of Bangor Cathedral.

**An Exhibition** of the pictures purchased at the sale of the Hamilton collection for the National Gallery will be opened shortly. The pictures will be hung on screens.

**Messrs. Robert Boyle & Son's** system of ventilation is the one applied at the Police Orphanage, Twickenham, a new wing of which was opened on July 8 by H.R.H. the Prince of Wales. Messrs. Boyle have also secured the ventilation of the new Royal Courts of Justice Chambers, at present being erected in Fleet Street.

**The Northwich Town Surveyor** has condemned the Town Hall as being in a ruinous and dangerous condition.

**Plans** have been submitted to the Aston Local Board during the year ending March 25 last, and approved, for the erection of 354 dwelling-houses, four manufactories and workshops, one school, one brewery, and sixteen other erections.

**The Commissioners of Sewers** have adopted a committee report deciding not to proceed further at present with the electric lighting of the City, owing to the cost of the electric light, and in view of the Bill before Parliament to confer upon local authorities the power to supply electricity for public and private purposes.

**A Memorial Tablet** is to be erected in Westminster Abbey in recognition of the disinterested services of the late Colonel Chester as editor and annotator of the "Westminster Abbey Register." Colonel Chester was a native of the United States of America, but had for many years been resident in England, where his reputation as an authority on all genealogical questions was unrivalled. His valuable papers, the result of many years of unwearied and discriminating industry, are in the hands of Mr. Cokayne, Norroy King of Arms. His work on the "Westminster Abbey Registers" (which forms the tenth volume of the publications of the Harleian Society) was printed in 1876, and was dedicated by permission to the Queen.

**A Statue of Mariette Bey**, the Egyptologist, was unveiled on Sunday in Boulogne. It is erected on the Esplanade, and stands upon a pyramid bearing the titles of his principal discoveries.

**The Society of British Artists** have elected Mr. Carl Haag an honorary member, and Messrs. Fred Barnard, Edward F. Brewtall, John Charlton, A. H. Marsh, John Scott, J. D. Watson, T. J. Watson, and R. C. Woodville members.

**The Council of the Society of Arts** have presented a memorial to the Secretary of State for India in Council, calling his attention to the great and growing demand in India and the colonies for the services of persons skilled in forest cultivation. The memorialists believe that no suitable provision exists at any of our great centres of instruction for the teaching of natural science in special reference to forestry, and they express an earnest hope that steps may be taken by the Indian Council to establish a department for such teaching in the Royal Engineering College at Cooper's Hill.

**The "Scientific American"** says the wrought-iron columns for the Albany bridge are said to be the largest ever made. The length of each is 53 feet 3½ inches. Each is composed of eight segments, the iron of which is 1 9-16 inch thick. Each column requires 894 steel rivets, and the weight complete is 18,806 pounds. The square inches of section are 104. The eight columns, therefore, contain 150,448 pounds of metal and 7,152 rivets.

**Wages in Edinburgh.**—A meeting of the Edinburgh and Leith Master Builders' Association was held on Monday last. Reports were received of 7*d.* per hour having been paid to builders at a few jobs in the suburbs, and 6*d.* per hour to hewers in the centre of the city; but it was stated that the general rate of wages at present for both hewers and builders appeared to be 6½*d.* per hour. Finally it was resolved that within the municipal boundaries of Edinburgh and Leith the wages for both hewers and builders be 6½*d.* per hour, and that where no shed accommodation was provided ¼*d.* per hour extra be paid. It was also resolved to request the Edinburgh Architectural Association to make universal the practice of a few of their number of intimating to competitors when a tender was accepted or declined.

**The Avenue Theatre.**—One result of the passage of the South-Eastern Railway Bill through both Houses of Parliament will be the demolition of the newly-erected Avenue Theatre on the Thames Embankment, which, in common with the whole of the eastern side of Craven Street, Strand, is scheduled in the Bill as a part of the property required in order to carry out the authorised widenings and extensions at Charing Cross Station.

**Whitworth Scholarships, 1882.**—The following are the successful competitors in the order of merit:—200*l.*: Charles Webster, Crewe. 150*l.*: J. H. Tomlinson, Newcastle-on-Tyne; J. H. Beaman, Woolwich; Thomas Turner, Sheffield; S. D. Codrington, Bristol; C. B. Outon, Stratford; G. H. Bannister, Woolwich; Frederick Lane, Woolwich; W. D. Laird, Woolwich. 100*l.*: Joseph Parry, Manchester; A. F. Ravenshear, London; C. W. Carter, Liverpool; A. Barrow, London; H. C. King, Swindon; M. Douglas, Crewe; Thomas H. Gardner, Manchester; E. E. Haine, London; George Halliday, Glasgow; G. W. Buckwell, Brighton; L. H. Cochrane, Liverpool; W. Duncanson, Stratford; H. Brown, Dudley; W. T. Hatch, Liverpool; T. Carlyle, Woolwich; A. J. Hill, Stratford.

# The Architect.

## THE LONDON TURNPIKE GATES.

ANYTHING more astonishing to the stranger than the circumstance that such a relic of feudalism should exist in London as turnpike gates which place the public traffic of important thoroughfares at the mercy of private individuals it would be difficult to imagine. Yet this is only a mild way of stating the fact. The turnpike

gates more properly so called—those for the collection of reasonable tolls in the public interest for the maintenance of the roads—have been abolished for miles round by the simple expedient of constituting the maintenance of the roads a charge upon the public rates. Even the Thames bridges have been relieved from such gates by purchase from the proprietary bodies which had originally built them as private adventures. In both cases the cost was fairly counted and fairly paid. The barriers which still remain are not established for the collection of tolls; neither do they apply to proprietary bodies; they cannot be bought off because there is nothing to buy; and it is for this very reason, perhaps, that their assertiveness is all the more resolutely supported, alike in defiance of the public convenience and the public common sense.

The press has long been keeping its eye upon these remarkable relics of departed tradition, and lately the wise *Punch* in particular has found its way to a highly-amused observation of them. A return of their actual number, also, has been called for by Parliament, and duly delivered. Something may therefore be done about them some of these days; and it may not be amiss if in a journal like *The Architect* an endeavour be made to explain what they really and practically are.

These London gates are numerous—there are nearly fifty of them; and they are capable of classification into several categories. The Crown itself—that is, the authorities of the public lands—maintain a good many of them; but as these are kept up chiefly if not altogether for the protection of the parks, they are not at all of the same character as the others. The Duke of WESTMINSTER has some in Pimlico. The Duke of BEDFORD has some in Bloomsbury. In practice those of the Duke of BEDFORD are so prominently and wantonly outrageous that it is not worth while to trouble ourselves with any of the rest.

In the time of the early GEORGES Bloomsbury was the Duke of BEDFORD's private grounds; and readers of THACKERAY may remember that one of his "Virginians," occupying suburban lodgings in Southampton Row, went out to fight a duel where it would appear Torrington Square now stands (of which we shall have something to say presently), Tottenham Court Fields at the back of Montague House, having in one direction Hampstead Hill in full view, while in another the statue on the steeple of St. George's Church overlooked the meeting—which was disturbed, by the way, by "two of Sir JOHN FIELDING's men" from Bow Street. The Duke of BEDFORD accordingly remains the freeholder of the land which was once his ancestor's paddocks; he receives ground rents for all the houses; and he is now becoming more vastly wealthy every day by taking the houses themselves and letting them at high rack-rents. Probably there is no other great freeholder in London with whom the relations of landlord and tenant are more entirely brought down to the level of pure business.

By what process of over-persuading the Legislature the Dukes of past time succeeded in preserving their authority over the thoroughfares of Bloomsbury, while they cast upon the public all the burden of making and maintaining those thoroughfares and building the houses, it would be quite unprofitable either to describe or to inquire; if we may make use of a celebrated formula of the Elizabethan age, "then was then and now is now," but what in this year of grace 1882 the public of London have to submit to as the anomalous result may be easily described. Everybody knows Tottenham Court Road and everybody knows Gray's Inn Lane. They lie in parallel lines rather more than three-quarters of a mile apart; and at their northern extremities they run into the

Euston Road at right angles. The portion of Euston Road lying between them has on its further side the three railway termini of the North-Western, the Midland, and the Great Northern lines. Between these great foci of the traffic of the United Kingdom and what is virtually almost the whole of London there lies the district of Bloomsbury. Now there is a street called Judd Street running parallel to Gray's Inn Road a little way westward. It would be a useful thoroughfare into the town but for the fact that it is cut short off at the Foundling Hospital. Between Judd Street, however, and Tottenham Court Road—which are five-eighths of a mile apart—there are six streets running southwards from the Euston Road through Bloomsbury. Of these six thoroughfares—will it be believed?—*every one is obstructed by a gate*, with a livery servant of the Duke of BEDFORD frowning back the traffic on both sides! The streets are Gower Street, Gordon Street, Taviton Street, Endsleigh Street, Upper Woburn Place, and Mabledon Place; and, if we are rightly informed, the very cabs going to and from the railway stations are stopped from passing through, whilst all vehicles whatever which are not stopped are permitted to pass by mere favour of the Duke of BEDFORD.

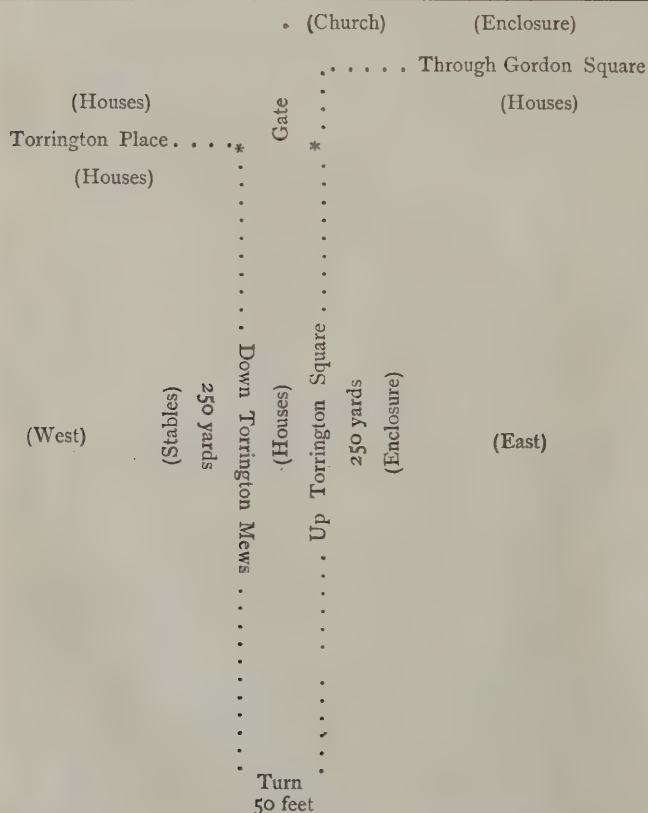

We may admit that the world has not yet reached that point of fatuity at which such an arrangement could be supposed to exist without an ostensible object. No doubt the Duke of BEDFORD has inherited an object of some sort, although what it is we may not so easily discover. But one thing is certain enough, that the public of London have no object in maintaining these barriers; and the idea that the denizens of Bloomsbury have any desire that they should be maintained we take leave to deny utterly.

The only object which we can suppose possible is the protection of the Duke's rents; but how far even this purpose can be served the reader must judge. In Russell Square, Bedford Square, Bloomsbury Square, and the surrounding quarter, for instance—by far the most valuable part of the estate—no impediment whatever exists to the passage of public traffic even of what may be the most obnoxious kind; it is only the second-rate squares more northward which are "protected" after all, and the way in which they are protected let us explain by an illustration. The reader no doubt knows the great Irvingite church in this neighbourhood. It stands at the northern end of Torrington Square, some way behind the British Museum. There comes past it from the west a very good and convenient street called Torrington Street. Close at the back of the houses of Torrington Square there is a narrow dirty parallel lane called Torrington Mews. The distance between this mews and the square is no more than 50 or 60 feet. Between the mouth of the mews and the end of the square there is a gate, indeed the principal gate of all gates, by which the traffic through Bloomsbury eastward is impeded just as it is northward at the Euston Road, but with a peculiar reservation which is almost incredible. The janitor in the ducal livery who is on duty does not allow vehicles (except of certain approved kinds) to pass; but his practical function is simply to *make the traffic go down the mews on one side of the gate and come up the square on the other side of the gate*, or down the square and up the mews, as the case may be. The diagram on the next page (which is set up to scale) will explain this eccentricity of arbitrary rule. That is to say, if a coal waggon or baker's cart has to pass from one side of the gate to a house on the other (literally), gruff Mr. Janitor sends it back into space, and a kind neighbour directs it in pity to go down on one side of the gate almost half-way to Holborn, and come up on the other, whereby, after traversing actually not far short of one-third of a mile, the astonished and indignant carman finds himself *through the gate!* On each side of the gate, therefore, the traffic which is presumably obnoxious to the Duke of BEDFORD's private interests is in absolutely undisturbed possession of the soil of Bloomsbury north as well as south, but the distance occupied by the thickness of the gate itself must not be crossed! It remains only for us to add with pleasure that the guardian of this remarkable obstruction is as inflexible as he ought to be; it would entirely spoil the farce if a silver key would open his gate. It is to be hoped, therefore, that his wages are of the best if his dwelling hard by is of the smallest, for anything more monotonously repugnant to the human nature of even the Bumble of a Duke than his dreadful duty of contending all day long with oburgatory London drivers in the interest of frivolous and vexatious arbitrary authority, one can scarcely conceive. Not long ago even a cab was not allowed to pass

through this barrier unless occupied by a fare. Cabby therefore would take up a street arab for the occasion, or a servant maid, and whisk hilariously through. The public laughter thus provoked all day long caused the Duke to remove the restriction so far as cabs are concerned,\* but the daintiest tradesman's trap in London, carrying the daintiest load, must still rattle down the dirty mews and up the adjacent square before it can pass into Bloomsbury! It reminds one of the fine potentiality of the Duke of ARGYLL in SCOTT'S romance; and the long-suffering of the metropolitan public recalls to mind the prudent counsel of the Highland mother to her peccant son, that he should go up quietly and be hanged in order to please the laird. The traffic of London in the very heart of the town submits to be strangled in order to please the laird.

Now, what can really be the object in maintaining an authority so vexatious, and yet so foolish, as this example proves it to be? To come at once to the point, is it for the sake of getting compensation out of the public purse? It would be hard to assign any limit to the theory of vested interests which our House of Lords, and by no means a small proportion of our House of Commons, may be found to hold, but surely we may be permitted to hope that the Legislature will never be induced to direct the metropolitan ratepayers to pay the Duke of BEDFORD a single shilling for the surrender of such a privilege as is here in question. We should be glad to be able to take a more liberal view of the case than this; but if it be not to establish a claim to money compensation, the only other object would seem to be a mere arbitrary assertion of wanton authority as an express insult to public opinion; which would be almost a less creditable explanation than the other. If the ducal rents are in danger, who created those rents? The Dukes gave to the public—for a consideration—the grounds of their houses; by the growth of London the public have in return made them millionaires. But how can even the value of the property be affected by traffic passing freely through a gate when it is already free on both sides of it? The whole arrangement is completely obsolete and childish; and the sooner the Metropolitan Board move seriously, and, if it must be, angrily, in the direction of its unreserved abolition, the sooner will they deserve the public thanks for an act of the very simplest and most imperative duty.

\* As it has sometimes happened, however, in greater things, Cabby died in the arms of victory. The partial concession of the Duke is said to have been considerably expedited by a great outcry which arose about the death of a liberal-minded but perhaps apoplectically-inclined Jehu, who one warm day became so agitated in an altercation with the myrmidon of authority that a coroner's jury had an opportunity of sitting upon his remains and expressing their opinion upon Bumbledon.

### THE PARTHENON FRIEZE.\*

IT is easy work to attack piece by piece almost any theory relating to matters of antiquity, and the critic who is content to stop there is safe in his own stronghold. If, however, his ambition goes the length of a new and original theory, he must submit to be done by as he has done to others. But in a recent memoir on the Parthenon frieze we observe that its author, Mr. DAVIDSON, while unceremoniously indulging in censure of his predecessors, succeeds in placing himself beyond retort, inasmuch as the very original theory which he proposes is not, like the others, made up of many parts more or less subject to criticism, but consists only of one idea. It cannot be examined piece by piece. It must be taken or rejected as a whole. Fortunately there is little or no knowledge displayed in the support of it, and we need have no hesitation in rejecting as an absurdity the idea that the Parthenon frieze is a dream of PERIKLES artistically realised by PHEIDIAS. It is not only an absurdity, but it is ludicrous, from the airs of superiority in which its author indulges; and this superiority is the more unpleasant because it is directed against the two or three German professors to whom he appears to owe what he knows on the subject. Most of all is it directed against Professor PETERSEN, and yet it was from him that Mr. DAVIDSON might have learned most; for no writer on the Parthenon has, we venture to say, contributed anything like the amount of subtle artistic observation that we find in the "Kunst des Pheidias" (Berlin, 1873), and in subtle artistic observation lies the root of the whole question. Mr. DAVIDSON is evidently gifted with a quickness of apprehension not rare among his American countrymen, but that is a condition of mind the very last to which we would look for artistic appreciation, at all events when it comes to be a question of refinement; it is, at the same time, a condition of mind which renders piecemeal criticism often effective, or apparently so, and that is much the same thing in a temporary discussion.

We had supposed it to be now a settled belief that the Parthenon frieze represents two sides of a procession. The correspondence of the composition on the two long sides is in itself sufficient to suggest this; and when it has been once suggested we can see from a moderate study of ancient art that the sculptor who had to represent one continuous procession round the four sides of a temple could hardly have done otherwise than has been done on the Parthenon. If, then, the now generally accepted explanation of the frieze in this respect is in perfect harmony with what is known of the early traditions of artistic composition, it is obviously out of place for Mr. DAVIDSON to act as if he were ignorant of these circumstances, and to say "I do not understand this"; "I do not understand that." His words are (p. 42):—"We have now examined all the hypotheses [yes, but not the arguments] by means of which it is proposed to reduce the two processions to one. We may therefore confidently conclude that two processions are represented in the Parthenon frieze. This conclusion, from which there is no escape but by assuming that the artist was a stupid blunderer, is by itself sufficient to upset the whole Panathenaic theory." These are mild words compared with what he glibly rolls off elsewhere; as, for example, on p. 46:—"It is only fair, however, to say that PETERSEN out-Germans even the Germans in wild theorising. One could collect a delightful list of absurd doctrines from the work we have been quoting." He means the "Kunst des Pheidias," to which we have referred above. It is by far the best piece of criticism of ancient art that we know of. If Mr. DAVIDSON had had but a small share of PETERSEN'S caution, he would have been saved from his "dream of PERICLES." In PETERSEN we find extensive knowledge and the keenest artistic appreciation; in Mr. DAVIDSON a mere smattering of knowledge, a vague imagination, and the licence of expression which would naturally be expected in these circumstances.

One of the most interesting groups in the east frieze of the Parthenon is that which has usually been described as a priest receiving from a boy the new robe (*peplos*) for ATHENA POLIAS. In recent years it has several times been proposed to explain the action of the priest rather as that of giving a robe, carefully folded, to the boy. Mr. DAVIDSON approves this view of the subject so much as to say (p. 58): "The person who first made clear that the man is not receiving but delivering the garment was Dr. FLASCH, and this demonstration is the one thing that

\* "The Parthenon Frieze, and other Essays." By Thomas Davidson. London: Kegan Paul, Trench & Co. 1882.

redeems his pamphlet from utter worthlessness." We are then told how Dr. FLASCH proved his case, and that "one has only to look over all the acts of giving he can remember in products of Greek art to convince himself how true this is." No doubt. But it is not an instance of either giving or receiving alone. It is an instance in which the act of giving is represented at a moment when it is also an act of receiving, and the examples which Dr. FLASCH adduces are away from the point. Yet immediately beside this group he might have seen the priestess engaged in precisely the same stage of the act of receiving, and had he searched carefully he would have found at least one very striking analogy which is conclusive against his theory.

Close to this group are two girls who are just arriving, each carrying on her head a four-legged stool for the priest, and priestess beside him, to take their seats on. The priestess is already preparing to relieve the foremost of the girls of her burden. Upon this Mr. DAVIDSON remarks (p. 113): "Surely a chief priestess, officiating at a great public sacrifice, would not be obliged to set her own stool and that of her assistant. Imagine an English bishop setting stools for himself and his assistant curate!" This may be meant for American humour; but it is a kind of language which we venture to describe as true-born Philistinism. It flows on, page after page, about these weary stools—whether they have legs or not, and how many, or whether, in fact, they are not baskets after all, "since baskets with legs were by no means unknown in antiquity" (p. 120).

It remains now to notice the "dream of PERIKLES" itself (p. 78). One of the plans of the great Athenian was to have a gathering at Athens of Greeks from all parts of the world wherever they were settled, and to this end he arranged that various sets of deputies should be despatched to invite them. At this gathering arrangements were to be made for the restoration of the temples burnt down by the Persians, for the performance of sacrifices, and other matters. "The object of this mission was never realised, and the convention never took place. . . . It is the sacrifice for which this convention was to provide that is the subject of the Parthenon frieze." That is to say, PHEIDIAS was set to work to prepare and execute a design to illustrate an event which was still in the uncertainty of the future, much as if he had been an Austrian artist of our day commissioned to prepare designs to celebrate the approaching silver wedding of the Emperor. It is only in art that nothing is impossible! But why, we may well ask, was PHEIDIAS confined to the frieze? Or were the combats of Centaurs and Lapithæ also meant to illustrate the scenes that were to take place in Athens when the rude Greeks of the North met the soft Ionians? Was the contest of ATHENA with POSEIDON in the west pediment to show the assembled multitudes how the Athenian supremacy at sea was, after all, a thing they need not fear, since the cultivation of the vine was the greatest source of prosperity? And how was the birth of ATHENA from the head of her father ZEUS, in the east pediment, to be interpreted as appropriate to the occasion?

## SUBWAYS AND LONDON STREETS.

IN the growth of a city such as London the accruing evils of overcrowding its streets fail to attract the attention and consideration they deserve. To meet the increasing wants for shops, warehouses, and dwellings, additional height of the buildings is provided, but the main and indispensable arteries of communication by which their comfortable occupancy can alone be secured remains neglected. The several and fluctuating widths of the Poultry, Cheapside, Ludgate Hill, Fleet Street, and the Strand may have been sufficiently commodious to meet the wants of a London population fifty years ago, but the most careless passer-by of to-day must be conscious that the constantly-recurring and almost chronic "blocks" are not creditable to our modern local government's intelligence. The dangers of the streets are too well known and their painful records too conspicuous to afford any excuse for so persistently neglecting or disregarding their constant recurrence. During some hours of the day a walk from the Mansion House to Charing Cross will prove to the most sceptical observer that other than existing provisions must be made to control and render comfortable such a traffic as that which prevails between the limits we have named. The crowded pavements and the

no less over-burdened carriage-way proclaim the fact beyond doubt or cavil, that these lines of streets are incompetent to perform their proper functions, so as to secure safety to the crowds by which they are used.

Notwithstanding the inconveniences and dangers we have referred to, there is much indeed to be thankful for when we consider the onerous and complicated duties thrust upon the streets above and below their surfaces. Underneath, in positions and under such conditions which we had better not too minutely examine, there are innumerable pipes of earthenware, iron, and lead, all huddled in confusing entanglement. A more precise knowledge of what is below it is as well that the confiding householder should never attempt to gain. The telegraph wires, and in some localities the exhaust tubes used by the Post Office for the dispatch of light packages, are added to the long-accumulating deposits made by water and gas companies' pipes during many years. If, therefore, we feel, with good reasons, surprise at the confusion prevailing on the surface, we are the more astonished when an opportunity offers enabling us to examine the dangers lurking beneath. Danger, indeed, lurks there in no stinted form, as more than one unfortunate gas explosion has fully demonstrated.

Besides the danger from gas (seweral and illuminating), there are the decaying pipes, saturating from their state of leakiness the soil in which they are imbedded, and thus storing up magazines of future plague-germs and other disease and death dealing producers.

The three great necessities of life—water, light, and facile disposal of household wants—are secured in such a way as to reflect but little credit on our vaunted civilisation and sanitary knowledge. A fire or a gas explosion, or a congested sewer, soon displays the shortcomings and dangers of some of the most crowded London thoroughfares. Yet under the pressure of any unusual strain on the water or gas companies' supplies a break-down is too common, affording ample proof that London, with its boastful boards and vestries, is much behind in practical efficiency many a third-rate town in less favoured districts of the British Empire. Many causes now operate to prevent that unity and compactness of interests which under any circumstances is so essential to good and efficient local government; but perhaps the most dangerous and unmanageable ingredients in this question are the vested interests of the gas and water companies. These peculiarly-privileged bodies, endowed with great and almost plenary powers, acquired under the authority of special legislation, usurp in the most reckless manner powers which it was never contemplated they should be permitted to enjoy. The most aggressive acts are committed in furtherance of the aggrandising policy of these rapacious companies, who disregard all complaints, and seem to delight in the knowledge that the great population of London is helplessly enthralled in their binding fetters of monopoly. Rich and poor are alike subject to their rapacity, and no modern parallel can be found to compare with the existing state of gas and water supply in the greatest city of this or any other time. A persistent and well-considered extravagance in needless works enables these giant companies to maintain a defiant position, proof against public feeling or State interference.

Practically, under such circumstances the water and gas companies and their officials and workmen are lords paramount over the streets of London, interfering in their selfishness with any scheme of subways for the more safe and convenient reception of gas mains and water pipes. Early legislation will, we trust, change such a condition of things, and place in the hands of the public the gas, water, and other supplies, when no obstacle would then exist to alter the scheme of indiscriminate pipe-laying as now carried on regardless of the inconveniences and dangers it occasions.

With a perfect knowledge before us of the causes which impede traffic, there can be no question of the desirability of immediate recourse to ample and well-conceived subways for accommodating all apparatus required for the supply of water, gas, and other necessary wants. We have already some moderate examples of subways in several of the new streets constructed by the Metropolitan Board of Works; but by some unpardonable legislative hitch when that self-asserting body was being clothed in its powers, full as they were at the time considered, it was found that the great monopolies of water and gas production and supply could not be compelled to use them. The Metropolitan Board constructed sewers and sub-

ways, but "gas and water" clung to their legal powers, and insisted upon disturbing the traffic by a maintenance of the right to lay down and deal with their pipes on the surface as hitherto.

Can there be for one moment any doubt in an intelligent mind that to continue longer apathetic on this most vital question would be to court and encourage a danger becoming daily more imminent? If there was any immediate prospect of a check to the prosperity of London, and therefore some chance of reducing the numbers of its population, then there might be a shadow of excuse for neglecting a matter of such paramount importance as the sensible government and control of its streets and thoroughfares.

Subways for London, more especially in its densely-populated centres and busiest streets, need not be constructed in the exact line of traffic, but take the most convenient routes competent to meet the present and prospective wants of the districts they traverse. To construct a subway along the Strand would involve an outlay, measured not so much by the simple constructive character of the work itself, but by consequential damage to trade during progress of the works. In such direction also the dimensions of a subway would be limited to the narrow confines of such a thoroughfare, and quite inadequate to meet the wants of so crowded a district. A much more comprehensive scheme of subways must be contrived to meet not only existing wants, but provide against all coming improvements of whatever kind.

One great advantage which a substantial subway would secure would be a good and sound foundation on which to build a durable roadway. Of whatever materials carriage- and foot-ways are now composed, much of their inefficiency and costliness is due to the absence of a thoroughly reliable foundation. The constant reparation and relaying of London's busiest streets is consequent on the inability of the made ground or concrete to resist the shocks and concussions of the heavy quick traffic passing over it. A roadway well constructed and of the right sort of materials would not be so troublesome or costly to repair, for, owing to the permanent character of the walls of the subway, the wearing or surface parts only would require renewal from time to time.

A well-devised scheme of substantial subways would be a costly matter no doubt, but they would reduce much expense and inconvenience which is under existing circumstances unavoidable. It would obviate the necessity of opening up a street and stopping its traffic to make repairs to or relay a gas or water pipe, while it would also secure ready access to sewer pipes, and control with greater efficiency their dangers and shortcomings. In cases of fire there would be perhaps the greatest advantage secured, for while having at ready and instant command a supply of water, all the troublesome and confusing crowding consequent upon fires would not interfere with the firemen's duties. It would be desirable, of course, to inaugurate with a good system of subways a competent staff of men to regulate and keep under intelligent control all matters connected therewith, as well as to manage the necessary repairs and examinations. In all weathers the pipes and their contents in the subway would remain proof against the fluctuating influences of heat and cold, securing during extremes of temperature a reliable dependence on the various supplies which they are designed to distribute.

Such a subway scheme would indeed be a leviathan undertaking, but there can be no doubt that it would eventually pay, not only in a financial sense, but in an increased safety from many now almost uncontrollable dangers. To estimate fairly the saving which subways would secure, all and every outlay at present incurred by gas and water companies, vestries, and other authorities, in repairs and changes of pipes and roadways must be taken into account. A check would be given to the monstrous expedients of the privileged companies to keep their income under by senseless works, so as to hold at arm's length all Government interference. Many a thousand pounds are thus squandered in needless repairs, so as to give an appearance of vigilant attention to the public wants, and at the same time secure for some favoured pavior a goodly income in making the necessary reparations to disjointed pavements and dislocated roadways.

But, alas! on reflection such a scheme as that which we have briefly outlined may be regarded under existing circumstances as the dream of a visionary, for there exists no authority competent to carry it out. The "City" fathers, the Metropolitan Board fashionables, and the vestries and

suburban authorities, must be first welded into a homogeneous mass of efficiency before any such dream can be realised. The City and Metropolitan Board notables cannot be too soon restrained in their vagaries, so as to save the Thames from eventual *enshoalment* and the low-lying lands and houses on its banks from perennial flooding.

### MR. BURGES' ADVICE TO A YOUNG ARCHITECT.

THE following characteristic letter was prepared by the late Mr. William Burges at the desire of a young architect who consulted him about the worthiest course to follow in the study and practice of architecture:—

MY DEAR SIR,—I venture to submit the following considerations to your notice:—

You have passed your apprenticeship, done your Academy, and finished the usual Continental tour, and the question now arises as to what you are going to do.

If you follow the usual course, you would take an office, hunt up work, and do the same, according to your lights, consoling yourself that many other architects would do it much worse.

Of course there are various sorts of practice, all of which are open to you, and you might become simply a house doctor, or a warehouse architect, or a light-and-air man, or an architectural policeman (*i.e.*, a district surveyor), or a general practitioner; and it is quite possible to make *money* by any of these, the amount depending on the extent of the practice, and that again upon the number of friends, besides the amount of the importunity and impudence by which work may be solicited.

But reflect; are any of these men artists? It is true that when they die they may have made money, but what else will they leave to the world beside that? Their names are simply written in water.

Now, it is quite open to you to take to all or any of these lines of practice, to make money, to bring up a family, to become churchwarden, and, above all, to be pronounced "warm" when you leave this world.

My object in writing these lines is to suggest to you that there is another course open by which you may perhaps be the means of leaving some beautiful things to posterity, and by which your name may possibly survive after you have quitted this life.

The question then arises, Why not try to be an artist, an accomplished man, a creator of works of art, and an ornament to your profession?

You have not the excuse that many have for not making the attempt, as I understand you are in a great measure independent of your profession.

Why not use that advantage to be something more than an idler on the one hand or a money-grubber on the other?

Try at least for a couple of years. They will not be lost years, even should you eventually not take up the artistic branch of your profession; for you will to a certain degree have educated yourself in the attempt, and you will be so much the better.

Supposing you decide to try, let us see where you are. You know something of modern construction, enough to enable you to practise without letting your buildings fall. You can draw well, and in an architectural and geometrical manner; but I know nothing of your perspectives, and your free-hand drawing is woolly, and wants precision. Above all, you are very defective in the human figure. (You have, I presume, a fair knowledge of the history of architecture.)

Now, I should recommend you to employ your next two years in three principal things:

1. The drawing of the human figure. This is really the foundation of all good taste. I don't mean that you should spend weeks in frizzling up a figure in chalk, for you are not going to be a painter, but that you should learn to draw correctly and know the bones and muscles which go to make up the outline, and, in fact, to be able to account for everything you see.

2. A serious course of reading of the best and most well-known authors. This also will conduce to form your taste. Philosophy and science will not help you so much as works of the imagination. Bohn's Library furnishes fair translations of the best writers at 5s. per volume; but if the work is a translation it is desirable to get two or more versions and to compare them together. In the

classics I should recommend Homer, Aristophanes, Æschylus, Herodotus, Xenophon, Virgil, Horace, Apuleius. Of the moderns, Dante, Chaucer, Shakespeare, "Faust," "Robinson Crusoe," "Undine," and Lane's translation of the "Arabian Nights." Of course I could mention many more, but these are sufficient for the present.

3. To carefully study and draw various beautiful things; and whether the said thing be a piece of jewellery or a piece of iron-work, or a building or portion of a building—to do it thoroughly, to find out its construction and why this and that is done, the basis of the ornamentation, the particular form of the curves, and never to leave it until you know all about it. The result will be that the next time you see a similar thing you will know all about it, and won't want to study it again. Do everything by common-sense; don't make a drawing when you can make a rubbing, and regard all your drawing in the light of evidence which is worth next to nothing if it is not authentic.

I consider you very lucky that you have such an opportunity of having your "learning time" over again, and I am quite sure that if you make up your mind to be industrious, your two years spent in the way I have ventured to suggest will be very happy as well as very useful ones.

Hoping you are not bored by the above,

I remain, yours truly,

W. BURGESS.

### THE PROPOSED PUBLIC OFFICES.

IN *The Architect* of last week Mr. John Taylor's evidence before the Committee of the House of Commons on the Public Offices Site Bill was published. We now give the evidence of Sir H. A. Hunt upon the value of the proposed site:—

*Mr. Wyatt*: I will just put the usual question to you as a matter of fact; have you read the recitals in the preamble to this Bill?—Yes.

Do you believe them to be true?—Yes.

*Mr. Wyatt* stated that this was all the evidence he proposed to produce for the preamble.

*Chairman*: You are Consulting Surveyor to the Office of Works?—Yes.

I need hardly ask whether you have been in that position for a great number of years?—A great number.

And you have made a valuation for the Government of the site proposed to be taken under this Bill?—Yes.

Will you give to the Committee the detail of that valuation?—This (*producing a plan*) is a copy of the deposited plan; and the part tinted with a pink colour is the part proposed to be taken compulsorily. It comprises Spring Gardens and five houses in Charing Cross. The total cost of acquiring that will be 458,185*l.*, and I have divided it in the following manner: the value of the property belonging to the Crown, now in the occupation of the Admiralty (many of these houses in Spring Gardens are in the occupation of the Admiralty), is 160,380*l.*; there are other houses in Spring Gardens in the occupation of various Government officials, including the Master Gunner's house, of which the value is 49,940*l.*; and there are other houses, the property of the Crown, in the occupation of private persons or let on leases, of which the value is 82,865*l.*; those three sums make a total of 293,185*l.* Then the value of the property belonging to private persons, and of the leasehold interests in the property belonging to the Crown, is 165,000*l.*, and that added to the 293,185*l.*, gives you the amount I have stated, namely, 458,185*l.* That is the cost of acquiring the property not in the possession at the present time of the Government; I understand the Admiralty and the First Lord's house and the Paymaster-General's Office to be in the possession of the Government.

458,000*l.*, therefore, represents the total sum which would have to be paid by the Government for the property which they propose to acquire under this Bill?—Yes.

And of that 293,000*l.* would be paid to the Crown, and 165,000*l.* to private persons?—That is so.

That does not include the value of the property which belongs to the Government, independently of the Crown, namely, the site of the present Admiralty?—It does not.

Does it include the two houses which it is proposed under the notices for this Bill to take, opposite to Drummond's Bank?—Yes, two houses.

And it includes the five houses fronting Whitehall, next to Biddulph's Bank, which are private houses?—Yes.

And various other leasehold interests in Spring Gardens?—Yes, it includes all that.

*Mr. Macfarlane*: It is an estimate of the value, not an arrangement made?—It is not an arrangement; it is an estimate.

*Chairman*: Under the clauses of this Bill it is proposed, is it not, to pay that 293,000*l.* to the Crown by an annuity spread over a term of years?—I do not know anything about that.

However, the clause speaks for itself?—Yes.

But practically it is a mere transfer from one Government department to another?—I suppose so.

And the sum outgoing to private individuals would be 165,000*l.*?—Yes.

*Mr. Gerard Noel*: Does that 485,000*l.* which you have told us is the cost of the land you propose to purchase include more than that which is marked yellow and green on this map (*pointing to a map*)?—Yes.

*Chairman*: It includes the whole that is marked blue and pink, with the exception of the property in the actual occupation of the Admiralty?—Yes.

*Mr. Gerard Noel*: Does it take Cocks' bank?—No; it goes up to Cocks' bank; it does not include Cocks' bank.

*Chairman*: Will you now explain to the Committee what is the value of the property which will be set free by this operation?—I have made an estimate of the property which will be set free when these two departments are erected; and the first property is the present War Office in Pall Mall, which I estimate to be worth 250,000*l.*; and then the Army Medical Board in Whitehall Yard, which, taking 600*l.* at twenty years' purchase, is worth 12,000*l.* That I call Crown property.

Is that property upon which the Government now pays rent to the Crown?—No, they do not pay rent for this: there are a few leases upon this property in Pall Mall, but they are for very short terms and very small rents.

It is not fully rated?—No, not near.

But the Government does pay rent?—To some extent, but not much. What I mean is that when the War Office is moved into the new building the Government or the Crown will have set free for sale or for building purposes the property in Pall Mall, which is represented by 250,000*l.*

Although the Government, as distinct from the Crown, does not pay full value now in the shape of rent to the Crown?—Nothing like it.

But it does pay some rent?—A small rent comparatively; I do not know what it is.

When set free by the operation of this Bill, that property in Pall Mall and Whitehall Yard will realise the value of 262,000*l.*?—Yes.

Then there is further property belonging to the Government, which you call Consolidated Fund property?—Yes; Winchester House, in St. James's Square, 45,000*l.*; Adair House, 49,700*l.*

You have valued the freehold of Adair House; it is only leased, but for the purposes of this calculation you must take the value of the fee simple?—You must take the rental at what it would be fairly capitalised at as representing what you would be saving. Then there is No. 35 Great George Street, Westminster, a house occupied by the War Department, 5,600*l.* Then I must take a sum for the value of the houses occupied by the Admiralty in Spring Gardens, because we shall not have to pay that; that is 160,380*l.*

That appears on the other side of the account?—Yes, that appears on the other side of the account, which means, in point of fact, that the total sum which would be realised either by the Crown or by the Consolidated Fund would be 522,680*l.*

As compared with an outlay of 458,000*l.*?—Yes; that is, of course, putting down nothing in respect of the Admiralty and the First Lord's house.

The effect of the operation of the Bill will be very beneficial as regards the Crown property, at all events?—It will be beneficial in a financial point of view, if you look at the Crown property as part of the property of the Government; it is out of one pocket into the other, in point of fact.

At all events, during the life of Her Majesty the Government will receive the rent of that?—Yes.

*Mr. Rylands*: Winchester House you estimated at what?—45,000*l.*

What did you give for it?—45,000*l.*

And you estimate it at the same amount?—Yes.

*Mr. Arthur Arnold*: What about Adair House; how do you arrive at the figures you gave?—By taking twenty years' purchase upon the rental we pay for it.

Was not Adair House purchased by the Government?—No; the Treasury would not buy it, and we have rented it.

*Chairman*: I think, when the Select Committee, the Report of which is before this Committee, was considering this question, you gave evidence in favour of the Great George Street site?—I did.

Would you lay before the Committee a comparison of the cost of the present scheme with that of the Great George Street scheme?—Yes.

By your scheme before that Committee it was proposed to take the whole of the property between Parliament Street, Great George Street, and St. James's Park?—Yes.

And upon that site you proposed that the War Office and the Admiralty should be erected?—Yes.

And a further building for the Council Office?—Yes.

As compared with the present site, that site gives a rather larger area for building purposes, does it not?—Yes.

What is the difference?—The site with which we are now dealing has an area of 237,000 feet; the Great George Street site to be

acquired was 288,000 feet, and the cost of it was estimated at 1,300,000*l.* Now, to make a fair comparison, I made an estimate of the whole cost, including that which I have already given you, and the probable value of the Admiralty premises, the First Lord's residence, and the Paymaster-General's office, so as to make a comparison between the two. If you could sell the Admiralty, if it were vacant land, the total cost of the site would be 927,000*l.*, as against 1,300,000*l.* in the Great George Street site.

For the purposes of comparison, you have valued the property which is in the possession of the Government, and occupied by the Admiralty?—Yes, and the Paymaster-General's office.

And putting a value upon that, you have then compared that with what we should have had to pay for the compulsory purchase of the rent of the Great George Street site?—Yes.

And the difference is, in round numbers, as between 1,300,000*l.* and 900,000*l.*, a difference of 400,000*l.*?—Yes.

But looking at it in perhaps a more practical manner, namely, what the money out of pocket to the Government would be, in the one case the Government would have to pay 165,000*l.* to private individuals, and in the other case something over 1,000,000*l.*?—Yes; but still, in making a comparison, you must look at it all as property, whether we use it for this purpose, or whether we sell it. And then that estimate of 522,000*l.* which I gave you as to property being set free, would apply to both schemes alike, and, in addition, the value of the Admiralty site in regard to the Great George Street site.

Of the Great George Street property a portion has already been bought by the Government?—Yes.

How much is that valued at?—Bought and paid for, 241,681*l.*

That is property mainly fronting Parliament Street and King Street?—And Charles Street, and some houses in Great George Street.

Of course one advantage of that scheme would be the widening of Parliament Street?—Yes.

Now, supposing the present scheme were adopted by Government, would it, in your opinion, still be possible to widen Parliament Street irrespective of the present plan?—Yes; I think the cost of the property that we have acquired, and the cost of the property to be acquired, would be recouped to any speculator, or to the Metropolitan Board of Works, by the vacant land which would be set free after the street had been widened.

Therefore, although the Government may adopt this present plan for rebuilding the Admiralty and the War Office, we need not abandon the idea of the widening of Parliament Street?—No.

That would be a metropolitan improvement, and might be carried out by the Metropolitan Board or any body authorised for the purpose, and, according to the figures, that still may be done without any loss to the Government or the public?—Yes; and the Government would then get back, of course, the 241,000*l.* which they have already paid on account of some buildings which they from time to time have acquired.

*Mr. Rylands*: What is the state of the ground so acquired; is it now covered by buildings in private occupation?—You mean Great George Street site? Partly; the only vacant ground there is is the ground in Charles Street, opposite the India Office.

*Mr. Arthur Arnold*: With regard to Clause 4, it is there provided that "the Commissioners shall pay all costs and expenses incurred by her Majesty or by the Commissioners of Woods in relation to the valuation of the said lands or the purchase-money under this Act"; could you give me now any estimate of what those costs will be?—I cannot indeed. It is an ordinary thing that the purchaser under compulsory Acts has to pay the vendor's expenses, and they depend entirely upon the litigation that may arise, and a variety of circumstances; but it will not be very much.

Did you value the Great George Street site?—Yes.

Does your memory supply you with the cost of the valuation in that case?—I got nothing for it; it was included in my salary.

Will this valuation be included in your salary?—As far as this valuation is concerned, it will be included in my salary also; I shall have nothing to do with the purchasing of the property.

*Chairman*: Since the report of the Committee of 1877 you are aware that Messrs. Drummond have rebuilt their bank?—Yes.

And that Messrs. Cocks & Biddulph have rebuilt theirs also?—Yes.

And do you know that both of those firms offered the land to the Government before building them?—I am under that impression, but I never saw any correspondence.

Under those circumstances should you consider that the Government was under a moral obligation not to take, under compulsion, their property?—I certainly should.

*Mr. Gerard Noel*: And did Messrs. Cocks & Biddulph apply to the Government?—I was under the impression that Messrs. Cocks & Biddulph applied to the Government before they erected their present new buildings.

On this plan of yours there is only space to erect the War Office and Admiralty?—Yes.

No space to offer to the Board of Trade, for instance, or to the Offices of Woods and Works, as there was, I think, on the Great George Street site?—No, it was never intended to put the Office

of Works upon the great George Street site, or any other buildings except the Council Office.

According to your Great George Street plan, the Office of Works was housed, was it not?—Not in the Great George Street site.

But in your plan it was?—Yes.

*Mr. Rylands*: In the estimate you gave us just now, comparing your Great George Street site with the one now proposed, as regards your estimate I understand that it only included the War Office and the Admiralty?—The Great George Street site? It included space for the Council Office also.

And that was all?—That was all.

*Chairman*: Can you compare the building area, not the ground, but what I may call the building area of your Great George Street plan, with that of the present one?—(The witness made a calculation.) The building area in my Great George Street site was 128,500 feet.

And the present plan provides 59,000 square feet for the War Office, 52,800 square feet for the Admiralty, and, I think, 9,000 square feet for that building in Spring Gardens, deducting 10 feet for widening the area—it is 150 by 60, which is 9,000 square feet—and that figure added to the others will give 8,000 feet difference between the two areas?—Yes.

*Mr. Arthur Arnold*: I presume that you are in no way responsible for the recommendation of the method in which the consideration is payable to Her Majesty?—None whatever.

*Mr. Gerard Noel*: Is what is called the Paymaster's Office included in the proposed new War Office?—No.

I think you said, in your evidence in 1877, that you required 62,000 feet for the War Office, allowing for the growth of the War Office; is 59,000 feet enough as now proposed?—I am not responsible for that figure.

## EXPLORATIONS AT EPHEBUS.

A MEETING was held at the Mansion House on Monday for the purpose of aiding in the resumption of the excavations on the site of the Temple of Diana at Ephesus. The Lord Mayor presided, and in opening the proceedings said the famous Temple of Diana at Ephesus, one of the seven wonders of the ancient world, had been hidden from view for many centuries, and its exact site was unknown, when in 1869 Mr. J. T. Wood, after six years of search, found its remains more than 20 feet below the present level. The trustees of the British Museum, who had supplied the means to explore some of the public buildings at Ephesus, then authorised the exploration of the ruins of the temple, and five years were devoted to the work, with the aid of Government grants to the amount of 12,000*l.* In 1874 very important excavations at Babylon and Nineveh were being carried on by the English Government, and the trustees resolved to suspend the work at Ephesus, as they thought it inexpedient at the time to apply to Government for fresh grants for the purpose. Mr. Wood had from year to year applied for a grant to continue and complete the explorations at the temple, but the times had been unfortunate for such enterprises, and there was little or no chance of further Government aid. An influential committee, under the patronage of the Duke of Albany and the presidency of Mr. Beresford-Hope, M.P., had been formed to resume the explorations by the aid of a public subscription, and it was in support of that object that that meeting was convened.

Professor Hayter-Lewis read letters expressing sympathy with the movement from the Prince of Wales, the Dukes of Connaught and Albany, the Primate, Cardinal Manning, Lord Shaftesbury, Canon Farrar, and others, including Sir F. Leighton, the president of the Royal Academy, who said that few discoveries had been of greater interest to the world of art and archaeology than those at Ephesus, and it would be a grievous thing if this country, possessing, as it did, the site of the Temple of Diana, should not continue the excavations, which had already produced so valuable a harvest.

Mr. J. T. Wood explained what had been already accomplished under his direction. In 1863 he began to dig in Ephesus. He was unsuccessful until 1869, when, having found an inscription in the great theatre which gave him a clue to its whereabouts, he managed to discover the building itself some distance to the north-eastward of the Coressian, or north of the Magnesian Gate. He had by means of grants from the British Museum, and by drawing on his private purse as far as was practicable, excavated a considerable portion of the temple, but funds having run short—and no more being apparently forthcoming—all further labour in that direction had to be abandoned. This was deeply to be regretted, as there could be no doubt from the indications he had noticed that, besides the great interest attaching to the famous Temple of Diana, a large number of most beautiful friezes were to be obtained from it. The sum required to complete the excavations was only about 4,500*l.* or 5,000*l.*

Professor Newton, Professor Donaldson, Mr. Pullan, and Professor Roger Smith addressed the meeting, and the following resolution was unanimously carried:—"That the complete excava-

tion of the Temple of Diana at Ephesus is an object well worthy of support from the nation, which now possesses in the British Museum the only portions of the beautiful sculptures discovered of the temple; and that a subscription list be at once opened." The proceedings terminated with a vote of thanks to the Lord Mayor.

### THE "OWEN JONES" PRIZES.

A COMPETITION was instituted in 1878 by the Council of the Society of Arts, as trustees of the sum of 400*l.* presented to them by the Owen Jones Memorial Committee, being the balance of the subscriptions to that fund, upon trust to expend the interest thereof in prizes to "students of the Schools of Art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design," and a bronze medal.

The following is a list of the successful candidates:—1. Thomas E. Doran, School of Art, Macclesfield, design for silk hangings. 2. James Meine, School of Art, Kidderminster, design for an Axminster carpet. 3. Thomas Linnell, School of Art, Leicester, design for tapestry hangings. 4. Alexander Park, School of Art, Glasgow, design for a carpet. 5. John Sykes, School of Art, Leicester, design for a wall-paper. 6. Frank E. Adams, School of Art, Macclesfield, design for furniture silk.

### SOME IRISH ARCHÆOLOGISTS.

A NEW and very cheap edition of the Life of Father Mathew, by the late Mr. J. F. Maguire, M.P., has been published by Messrs. Burns and Oates. It contains many sketches of notable characters who lived in Ireland thirty or forty years ago. Among them is the Rev. Matthew Horgan, who had a reputation in Munster for his freaks in archæology. Having been puzzled by the builders of past ages who erected round towers, of which the use is inexplicable, he resolved to puzzle posterity by erecting one on a new plan, and if the effect of it on his contemporaries may be accepted as evidence, there could be little doubt of his success.

Father Mat, whose name was known to every Irish scholar, was, says Mr. Maguire, as homely in his appearance as he was simple and kindly in his manner. Innocent as a child in the ways and wiles of the world, he was also as credulous in his guileless vanity. He regarded himself as the highest authority on all questions appertaining to the science of agriculture, and, without disparagement of any other man, he held himself to be possessed of a more thorough and comprehensive knowledge of the principles of architecture, sacred as well as secular, ancient as well as modern, than any architect of any age or country. He was as conversant with the Cyclopean as with the Greek and Roman styles—with the fire-pillars of the Persians as with the cavern temples of the Egyptians. From various styles he derived a new order of his own which might be termed Horganian. Father Mat was not content with being a theorist; he was a practical propagandist as well. As ready to superintend the erection of a cathedral as the building of a school-house, he was ever on the look-out for the opportunity of undertaking one of those great works, through which the name and fame of the erudite and accomplished pastor of Blarney were to be transmitted to future ages. I cannot pretend to say how many are the now existing proofs of the architectural genius of Father Mat; but there is still extant a church which he was permitted to adorn externally by the addition of an excrescence, partly of the nature of a tower and partly of a spire, which has scarcely its equal in the world for elaborate incongruity and perplexing novelty. It is one of those marvellous works which bewilder the mind. Of this sublime effort of his inventive genius Father Mat would speak with intense enthusiasm; but it was on another work—his Round Tower—that he proudly rested his claim to the imperishable gratitude of posterity. This was his darling work, the very apple of his eye. The enraptured tourist may behold it as the train passes the village of Blarney. This rival of the fire-pillars of the Persians was partly erected with his own hands; for Father Mat would lay aside the eloquent pen with which he had encountered Vallancey, Petrie, or O'Brien, in refutation or in defence of some hated or cherished theory respecting the origin and use of the Round Towers of Ireland, in order to don the apron and assume the trowel of a mason. As this grotesque structure rose, course above course, so did Father Mat's exultation swell in proportion. This monster of stone and mortar was his child—the offspring alike of his reverence and his enthusiasm—which was to refute false theories, convince the sceptic, and confound the scoffer. This "celestial index" was to endure for ages, as the most splendid evidence of the antiquarian faith and erudition of the priest of Blarney. It has been irreverently but not inaptly described, no doubt by people without faith, as "an architectural churn;" and really if the great

people with whom Gulliver was made acquainted in his travels could have seen it, they might possibly have appropriated it to the humble use which the name implies. The shallowest impostor could wind Father Mat round his little finger were he to speak of the Horganian Spire of Queenstown or the Round Tower of Blarney with becoming admiration.

Surrounding the erudite parish priest of Blarney was a group of zealous antiquaries, who devoted many a leisure hour to pleasant excursions—to the exploration and inspection of ruined abbeys, Danish forts, round towers, cairns, Ogham inscriptions, and matters of similar interest. Their more serious labours were diversified by social intercourse of the most agreeable kind, in which were drawn forth the convivial talents and harmless peculiarities of the learned brotherhood.

Amongst them was Windele, the author of more than one work of merit, and one of the safest authorities on all subjects connected with the laws, customs, literature, and history of ancient Ireland.

Then there was Keleher, the librarian of the Cork Library, whose chief interest in antiquities lay in the amusement which the enthusiasm of his friends afforded him, and the opportunities for ridicule, and fun, and practical joke, of which their discoveries and speculations were the constant occasion. The crypt of the "fort," which the other members of this society approached with interest and penetrated with awe, was, according to him, an abandoned fox-hole; those mysterious writings on slabs or blocks of stone, through which Father Mat, or Windele, or other illustrious pundits, read the epitaph of a hero or a bard, or the record of some striking event in the annals of a royal race, were, with the irreverent librarian, nothing more wonderful than milk-scores; and those upright stones of great size, which were pronounced to have been "Druidical Phalli" by the most famous Celtic scholars of the day, were, in the esteem of the unbelieving Keleher, conveniences considerably erected for the gratification of cattle—in other words, "cow-scratchers," as he elegantly designated them.

But there was one member of the body whose good nature, gaiety, and child-like simplicity rendered him the delight of his learned brethren. This was Abraham Abel, a Quaker of literary tastes and antiquarian tendencies. Abraham was far advanced in years, but as lively and agile as a boy. His neat dapper little figure, and his vivacious temperament, gave one the idea of a mercurial gentleman of thirty; but Abraham had approached his sixtieth year. In the matchless simplicity and the marvellous credulity of this guileless human being, his waggish associates possessed a never-failing source of enjoyment. The wonderful discoveries to which Abraham stood godfather would, if proved authentic, have upset the theories and speculations of all the great writers on Irish antiquities; but such discoveries were invariably the result of some well-laid plan of his friends to whom his exultation at these fortunate elucidations of long-existing causes of perplexity was a delicious treat, of which they never tired.

Abraham Abel once received a valentine written in Ogham (*oum*) characters, at which his wonder was very great. He immediately brought the prize to his friend the librarian, for the benefit of his translation of characters which, to the object of the epistle, were a profound mystery. "My dear William," said Abraham, in a whistling voice, and wagging his little chin, on which grew a small-pointed beard, "I never received a valentine before in all my life. And is it not most strange that the first should be written in Ogham!" The document was gravely investigated by the librarian, while his little friend stood by in a fever of expectation. "You are a happy man, Abel," began the learned decipherer; and thereupon he favoured him with a free translation of the valentine, which disclosed a burning, long-concealed, and unrequited passion, expressed in language of so intense a character as to suffuse the face of the venerable bachelor with blushes, and even make him question his identity. "Dear me, dear me! Poor creature, poor creature!" was the sole commentary of the commiserating Abel; but it was almost enough to give the translator an attack of apoplexy, from his efforts to control his laughter; for, of course, the precious document was the result of a deliberate conspiracy. It might be added that the translator knew as much of Ogham as he did of Sanscrit.

For a time Abraham stoutly maintained the theory that at an early period of the world man went on all-fours; and on one occasion he displayed remarkable agility in illustrating his theory by practical experiment. A field near Blarney was the scene of this illustrated lecture on the antediluvian mode of human progression.

Father Mat died on March 1, 1849, in the seventy-third year of his age, and the forty-sixth of his ministry, thirty-four of which he devoted to the duties of parish priest of Blarney and Whitechurch. At his death a sum of *three shillings* was found after him, as his sole earthly possession. It was his wish to be buried in his beloved Round Tower, and he left elaborate directions for this ceremonial; but the wish was disregarded.

**Lower Sherringham.**—The memorial-stones of a Primitive Methodist chapel at Lower Sherringham have lately been laid. The cost of the work, including land, &c., will be over 700*l.* The architect is Mr. Baker, of Yarmouth; the contractor for the work being Mr. Robert Bertram, of Aylsham.

## NOTES AND COMMENTS.

ON Monday, in the House of Commons, Lord ELCHO inquired about the conditions of the competition for the proposed War Office and Admiralty. The first Commissioner of Works informed his lordship that he had not yet decided what form the competition for the new buildings should take. Some of the best architects declined to compete if it were an open competition, on the ground of the great expense of preparing designs. He was told, however, that it would be possible to adopt a plan of having a double competition; first, sketch designs, and then a selection of five or six of the best for the complete design. The matter has not yet been decided.

MR. SHAW LEFEVRE also said that it was anticipated that the New Courts of Justice would be ready on the first day of next term. He was unable to say with assurance that the courts at Westminster would be removed; but there was a certain obligation to the public that the old courts should be pulled down, so that the exterior of Westminster Hall might be seen. What the general effect would be was at present a matter of doubt. Mr. SHAW LEFEVRE believed Sir CHARLES BARRY was of opinion that the general architectural effect would not be altogether satisfactory, and that he had contemplated another wing of the Houses of Parliament; but in regard to this no decision had been arrived at.

ON Monday last, Sir ARTHUR HOBHOUSE, Q.C., the arbitrator under the Epping Forest Acts, signed his final award. During the four years which the case has occupied he has made over 700 orders. Of the total acreage of the forest ascertained by the Commissioners in 1877—over 6,000 acres—5,531 acres have been purchased by the Corporation and are dedicated to the public; while about 532 acres remain enclosed, partly under conditions preventing building, and thus tending to enhance the value of the forest as an open space. The aggregate purchase-money paid for the 5,531 acres now public property is 189,012*l.* In addition, 21,892*l.* have been spent in extinguishing rights of lopping trees, with a view to prevent the disfigurement of the forest, and the hereditary Lord Warden of the forest has received 300*l.* as compensation for the extinguishment of his office. A sum of 8,000*l.* has been paid by the Corporation to secure the addition to the forest of the woods, ponds, and heronry of old Wanstead Park. Some 2,000*l.* has been spent in printing the notes of proceedings during the arbitration, and, perhaps most interesting item of all, 33,489 was disbursed by the Corporation in fighting the suit which established the illegality of the enclosures in the forest, and in protecting the public interests before the Epping Forest Commission, which sat from 1871 to 1877. The grand total of expense thus reached is 256,275*l.*

A FEW days ago, M. BARTHOLDI, the designer of the colossal statue of *Liberty Enlightening the World*—which is to be erected near New York in commemoration of the American War of Independence—entertained a party of his friends at luncheon. The table was laid in the lower folds of the drapery of the figure. MM. GAGET, GAUTHIER & Co., of Paris, the contractors for the erection of the statue, have been obliged to take a plot of ground adjoining their foundry, and covering 3,000 square metres, upon which the scaffolding has been fixed. The interior of the statue contains an iron backing, to which are attached the exterior parts, consisting of bronze plates, about  $\frac{1}{10}$  inch thick by 4 feet  $7\frac{1}{2}$  square—the largest size made in the trade. The plates are kept together by rivets that are invisible from the outside. The plates of bronze are made to correspond with the contours of the model in an ingenious way. A skeleton of fine wickerwork was first formed, and this was covered with a thick coat of plaster moulded to an exact reproduction of the original. Upon the plaster 6-inch templates of thin wood are adjusted, and are then given to the bronze-workers for models. The weight of the figure will be about 150 tons; the height from head to foot about 110 feet; and from the end of the torch raised in the right hand to the feet, 140 feet. The cost of execution will exceed 28,000*l.*, and the work will require five years for completion.

THE French Archæological Society for the Study and Preservation of Historic Monuments will hold its forty-ninth session at Avignon. The congress will open at 3 P.M. on Saturday, September 26, in the Hôtel de Ville of that town, and will terminate its sittings on October 1.

THE members of the jury appointed in connection with the Exhibition of Plans and Models of School Buildings at the Trocadéro have decided to award no prizes in the first four classes into which the exhibits are divided, but only honourable mentions. The classes include plans and models of lycées, normal schools, upper primary schools, professional and technical schools, city schools, and training colleges for teachers. This decision is based upon the conviction of the jurors that the merit of the exhibits does not by any means come up to what might have been expected under the circumstances.

THE King of Italy has signed a decree for the creation of a gallery of modern art at Rome. The new collection will be arranged in the Michael Angelo cloisters at the Diocletian Baths, and is to be opened during the month of October next. A sum of 4,000*l.* will be introduced each year in the public budget for the purchase of works by contemporary artists.

M. FLOQUET, the Prefect of the Seine, has drawn up a scheme by which associations of workmen will be admitted to compete for public works in Paris. The workmen's delegates have maintained that if the Administration would consent to make regular fortnightly or monthly payments on account, they would undertake to leave as a guarantee until completion a deposit of from 20 to 30 per cent. on each of these payments. The Administration has agreed to this arrangement, but exacts other guarantees and conditions on the part of the men:—1. The creation of a special fund in aid of those of the associated workmen who may fall ill or be wounded in the execution of the work, and for the widows and children of the deceased partners. 2. The establishment of an arbitration board of three members charged to regulate all disputes between the men, without prejudice to the authority conferred by the regulations upon the official architects and engineers. 3. The nomination of one or more syndics, furnished with full legal powers to act on behalf of the association and with certificates of capacity and good conduct; these syndics will draw up the tenders, and, in case of their being accepted, will superintend their execution as clerks of the works, under the supervision of the architects and engineers. In case of the scheme being adopted, a committee of eight members of the Municipal Council will be appointed by that body to decide on the occasion of each public adjudication, as to whether or no the workmen's associations shall be admitted to compete. It is probable that M. FLOQUET's scheme, of which the above is an abstract, will be almost unanimously approved by the Council.

THE Guardians of the Bromsgrove Union are in a difficulty with regard to the designs for the new Infirmary. The Local Government Board did not approve of the plans, which were drawn by Mr. C. A. EDGE, the architect. Accordingly he prepared a second set, which the Guardians decline to submit for the approval of the authorities. Mr. EDGE properly stands on his rights, and says that he could not submit to be thrown over in the manner contemplated by some of the Guardians. If his new plans are inadmissible, he is willing to go into the matter *de novo*, as he is confident that he can ultimately satisfy both the Guardians and the Local Government Board. At the meeting on Wednesday it was contended, on the one hand, that Mr. EDGE had not fulfilled his contract with the Guardians, as he undertook to get his plan approved by the Local Government Board, and had not done so; and, on the other hand, that, according to the terms of the advertisement, Mr. EDGE was the architect for the building, his plans having been accepted by the Guardians, and his commission of 5 per cent. on the outlay would have to be paid if any other architect were employed. It was at length decided to postpone the further discussion of the subject for a month, when the Guardians may be disposed to act wisely and fairly.

THREE months ago the Administrative Commission of Fine Arts delegated four of its members to report upon the present condition of the decorative works of art in the Municipal Buildings of Paris. After a careful examination, it has been discovered that the magnificent frescoes by RESTOUT, on the dome of the grand staircase at the HENRI IV. Lycée, require immediate restoration. Other mural decorations are also mentioned as standing in need of attention, and the consent of the Municipal Council for the carrying out of the necessary work will be at once demanded.

## ILLUSTRATIONS.

THE NEW CORN EXCHANGE, SHEFFIELD.

THE building, which we illustrate this week, was commenced in July 1878, and completed early in the present year, and takes the place of the old building where the business of the Duke of NORFOLK's Sheffield estates and the corn market was carried on, and which occupied a portion of the site of the new wholesale covered fruit and vegetable markets.

The new structure comprises a central hall for the use of the corn factors, 150 feet long and 75 feet wide, and 35 feet high. The roof is entirely of oak, in five spans or sections, supported by stone pillars having axed granite pedestals, and supporting arched principals. This arrangement has been adopted to secure the steady north light so necessary for the corn dealers, and, in addition to the skylights, there are five three-light windows in the eastern gables. The desks or stands for the factors are pitch pine of convenient design, and there is space for one hundred and twenty. The floor is of narrow pitch pine boards 2 inches in thickness, and the hall is well warmed and ventilated. There are four entrances groined in stone and brick, and the settling-rooms, lavatories, &c., are arranged on the eastern side.

The principal façade of the building, which occupies the site of the old hay market, is 225 feet long, and the lateral elevations are each 135 feet long. We give an illustration of the principal entrance gateway from a water-colour drawing by Mr. BREWER exhibited at the Royal Academy last year, and with it careful detailed working drawings of this portion of the building, and also of the southern gateway, furnished by the architects to further illustrate their design. These gateways have hammered iron gates, those to the main entrance having had especial care bestowed on their design, and the "badges of the noble house of NORFOLK, the sprig of oak leaf and acorn, and the dog rose, worked into the scrolls of the upper panels. In the string-course above is the famous motto, "Sola virtus invicta," and the date 1881 is cleverly worked in the spandrels below. The oriel above, of two stages, lights the large muniment-room, which occupies the space above, and is groined in stone and entirely fireproof. The great shield of arms of the Duke of NORFOLK, quartering the Duchess, is displayed in the upper portion with the three crests borne by the Duke—HOWARD at the top, and DE BROTHERTON and FITZALAN at the sides.

We give a plan of the first floor, from which it will be seen that a first-class family and commercial hotel occupies the northern front. There are thirty-two bedrooms, spacious restaurant, billiard and smoking rooms, and private sitting-rooms, and complete offices occupying the basement, with extensive cellarage.

Along the west and south fronts are spacious sale-shops with mezzanine floors and basement kitchen to each, the DENNETT & INGLE system of arched flooring being used throughout. There is a fine range of extensive cellarage to let off under the large hall, with cart entrances. The first floor of the south wing, including the tower, in which, over the main entrance, is a fireproof muniment-room, is occupied by the offices of the Duke of NORFOLK's Sheffield estate. These are spacious and carefully-planned, all the joiners' work, floors and fittings being of excellent wainscot oakwork. The ceilings are of delicate ribbed plaster, panelled, carefully studied after old local and South Yorkshire patterns. There are also several suites of offices to let off, those on the main front to north of tower being occupied by the architects, Messrs. HADFIELD & SON, while the extensive range above the estate offices on the second floor are let to the Nunnery Colliery Co., Limited.

A feature of interest has been arranged in the large Corn Exchange Hall by the introduction, on the roof corbels, of the arms with supporters of the Lords of Sheffield. They are twenty in number, commencing with JOHN TALBOT, first Earl of Shrewsbury, quartering his wife, MAUD NEVIL, Lady Furnival, heiress of Hallamshire, and finishing with his Grace the Most Noble HENRY, the present and fifteenth Duke of NORFOLK, and his amiable Duchess, FLORA, daughter of CHARLES FREDERICK ABNEY HASTINGS, Baron Donington, Howard, and Hastings, the well-known maunche, which same quartering occurs on the shield of GEORGE TALBOT, the fourth Earl of Shrewsbury, who married the Lady ANNE, daughter of WILLIAM, Lord Hastings, an ancestor of the Duchess. It has been the Duke's desire to identify her Grace with himself throughout the erection of this

building, and excellent portrait-heads of both are carved as label terminations in the main inner entrance doorway.

The general design, as shown in our illustration, taken from Mr. BREWER's fine water-colour drawing, is of the Tudor type, of the Cardinal WOLSEY tradition, and local influences and traditions have been carefully studied throughout the work, the materials being thin red bricks, with stone facings from a quarry on the estate near Rotherham, of a durable texture and warm colour; the same stone, in fact, as wrought at the parish church at Rotherham. The high price of labour at the time the buildings were projected induced reticence in the use of stone dressings. The roofs are covered with brindled Broseley tiles. The lead bell-turret with clock-dial, over the central gateway, has not been carried out, the design not having been approved for the present. We may also observe that the front entrance gates, as executed, are shown on the scale drawing.

Messrs. HADFIELD & SON, the architects, have given daily supervision to this extensive work during its progress, having had the advantage of offices within a stone's throw; and their drawings and intentions have been very efficiently and ably carried out by the contractors, Messrs. JOHN TOMLINSON & SONS, of Leeds and Sheffield. Mr. R. W. PAYNE was clerk of works.

The drainage and sanitary arrangements have had careful consideration at the hands of the architects, and the heating and ventilation have been satisfactorily executed by Mr. W. W. PHIPSON, C.E. The excellent stone and wood carving has been carried out by Mr. McCULLOCH, of Kennington Road.

Messrs. HARDMAN & Co. have been entrusted with the wrought-iron gates and other ornamental iron and brass work.

The quantities were taken out by Mr. D. J. BROWN, F.S.I., of Lincoln's Inn.

The cost of the whole building will be about 55,000*l*.

## A SAXON FORTIFICATION.

THE members of the Norfolk and Norwich Archæological Society visited a part of West Norfolk last week, including Narford, Westacre, Southacre, and Castleacre. At Castleacre a paper was read by the Rev. C. R. Manning on the remains of the castle and other works, to which a Roman origin is sometimes ascribed. He said:—

The one great point which was overlooked by, and indeed unknown to, our older antiquaries, is that a vast series of earthworks, or rather castle mounds and base courts with inclosing banks, were erected during the four centuries preceding the Norman Conquest by the settlers from the Northern and other continental nations, whom we call the "Saxons," but who are in fact the English, our own forefathers. From the middle of the seventh century to the Norman Conquest this country was everywhere peopled by our race, the British inhabitants being absorbed or driven westward to Wales and Cornwall. Almost every town and village still retains the names of the families who came over and settled here. They were not, like the Britons, a tribal settlement of people living in common on the defence in hill-tops; nor like the Romans, a military garrison in camps and tasteful villas, the product of a more Southern civilisation; but they had much of the institutions of municipal and family life—they were domestic and home-loving like ourselves, their descendants. They lived on their farms and among their cattle, and their lords and chieftains dwelt in fortified castles built of earth and wood. We know that these castles consisted of a great earthen mound or motte or burh, on the top of which was not a stone castle, but a wooden one, with a bridge thrown over the ditch, and with several inclosed courtyards or baileys for the houses of dependents and for cattle. It is particularly to be remembered that the square stone castle came in with the Normans, and that they did not erect mounds. Their ancestors in Normandy, who were the same (or allied) "Northmen" as the Saxon settlers here, did so, and there are many castles there still exactly corresponding to ours here; but at the time of the Conquest they had learned to build in stone, and relied on stone castles for habitation and defence; and these they could not have built on freshly-erected mounds, as the foundation would not have been secure. Wherever we find a great mound, whether or not there are remains of later stone castles upon them, with horseshoe or oval or rectangular earthworks adjoining, we now know that these are the work of the Northern and German settlers before the Norman Conquest. The evidence for this is clear and unimpeachable. Mr. Clark's valuable papers in the *Archæological Journal*, xxiv. 100, will convince the most sceptical; and I have gathered together much of the proofs he has brought forward in a paper on the Castle at Eye, Suffolk, published by the Suffolk Institute of Archæology. The Saxon Chronicle gives us numerous instances of the throwing up of these mounds for defence and habitation. The earliest is

Bamborough, made by Ina in 547, who also constructed one at Taunton, destroyed by Queen Ethelburga in 722. Another was erected at Bourn by Merca, the Saxon lord, part of which remains. King Edward, in 913, threw up such mounds at Hertford and Witham, in 920 at Maldon, in 922 at Stamford, and in 924 at Bakewell. Inferior dwellings were sufficiently protected by wooden stockades and paling, together with the natural defences of wood and water. But the chief lord, the holder of a great lordship or honour, had his "aula," his hall and fortified residence on such a mound as we see here, with its adjoining enclosures protected by strong banks. The plan of these is nearly always much the same. The mound is placed not within a bank, but upon one end of it, so that the banks die into it, and itself forms a part of the bank at that point, and the comparison of many plans helps to prove the common origin and date of such works. There is one at Mileham, not far off, which was the seat of an "honour"; and last year we had the pleasure, in our excursion to Denton, of ascertaining that the earthworks at Darrow Wood there were no other than the remains of a small Saxon castle. In further proof of their age, I may quote a contemporary account, furnished by M. de Caumont in his lectures on military architecture, written about the end of the eleventh century (*Art Journal*, xxiv. 101). A certain Colmin, Archdeacon of Jerouane, says:—"The rich and powerful first secure a strong place for their personal safety and the keeping of their prisoners and their wealth. They commonly throw up a mound of earth, surrounded with a deep ditch, upon the inner edge of which they establish a stout palisade of squared timber, strongly bound together, equal for defence to a wall, and strengthened by turrets or towers. Upon the centre of the mound is placed the residence, only to be approached by a steep bridge across the ditch." This description is illustrated by the Bayeux tapestry, upon which is represented the taking of Dinan. Here is seen the conical hill, surmounted by a timber building, which two men are attempting to set on fire, whilst others are ascending the mound by the steep bridge, reaching nearly to a gateway at its summit.

There can be no question that the earthworks here are not of Norman date, but Saxon, and that the Norman castle of stone was built on the already fortified site. Mr. Harrod was acute enough to see this plainly, but from not having the knowledge of the present day as to the Saxon method of fortification he did not attribute them to the mound builders of that age, and put them further back to the British or pre-historic period. A point of great interest that arises here is this. We see a somewhat rectangular bank, of very large extent, enclosing ten acres, and a great part of the present village of Castleacre, the main street running through it. It starts from the mound at the northern corner, and runs nearly west for about 800 feet, turns a right angle, and runs south for 900 feet, and then with another angle runs due east until it meets the horseshoe base court south of the mound. From the extent and somewhat square form of this work Mr. Harrod decided that it was Roman, and he was fortunate enough to strengthen his views by the discovery of some Roman pottery when digging into the bank; but this was in the circular work, the mound, where he supposed the fourth side of the Roman camp to have stood. There are, no doubt, instances in the country of Roman camps having been thus utilised in Saxon and Norman times, and Mr. Clark mentions Castleacre as one, probably not having visited it, and relying on Mr. Harrod's account. But I venture, with all diffidence, to think that there is really no sound reason for regarding any of the work here as Roman. The square form on the western side proves nothing, as that shape might of course at any time be used, and the south bank clearly runs at an angle into the horseshoe work, which is certainly Saxon. Roman coins and pottery in a bank rather help to show that the bank is later, as that would not be their original place of deposit. Roman banks were much lower than these, and intended to carry high walls. The height of the bank is, I think, a strong argument against their Roman origin. So extensive a work as this, too, if it were Roman, would, I think, be capable of identification with some named station, or would have retained a nomenclature such as "Caistor," which could not be mistaken. There is no reason why the Saxon lord, whose name in the Confessor's time appears to have been Toche or Toka, who held several other manors in this district, should not have required so large a yard for his cattle, &c. In fact, it was the great size and importance of this Saxon fortress that led Earl Warenne, after the Conquest, to make it the seat of his "honour," and to give it precedence over his 139 other manors in Norfolk. I do not wish to assert too positively that no portion of these earthworks can be Roman, but I certainly do not think they are; and if Mr. Harrod were alive, and had the advantages of later information, I believe that he would have admitted his error. Of the subsequent history of this castle I do not propose to speak, except to remind you now that we are on the spot of its rather brief period of grandeur and importance after the Conquest. It was granted by William the Conqueror to William de Warenne. Whether it was the seat of an "honour" before the Conquest I have no means of ascertaining; but I very little doubt but that it was, like Mileham (and Horstead?) and Eye. The first De Warenne married Gundreda, supposed to have been the daughter of the Conqueror,

who died here, and whose fine tomb is at Lewes, in Sussex. Edward I. visited here several times, the last time in 1297. It continued in the De Warennes till 1347, when, at the death of John, the last of the family, it devolved on the Earl of Arundel. It was already in ruins, and has long ceased to possess any architectural features. A few ivy-clad rubble walls remain to attest the situation of the noble stone castle of the Norman owners, while the older and more lasting earthworks of the Saxons have again become the most prominent objects in the scene, however invaded and encroached upon by the farmyard and shop and cottage of modern days.

### ANCIENT SOUTHAMPTON.

THE members of the North Hants Archæological Society visited Southampton last week. At a meeting in the Hartley Institution an address was delivered by Mr. T. W. Shore on the history of the town. He said that there was evidence to show that Bevois Hill and the district of St. Mary's were Roman burial-places, or places where Roman outlying settlements existed, and in Saxon times they had proof that the site of the town was situated near St. Mary's Church, and it was probable that the ancient Saxon church was dedicated to St. Nicholas, and occupied a position somewhat east of the present St. Mary's Church. St. Nicholas was the patron saint of sailors, and Leland in 1646 saw the remains of this small church standing. No doubt St. Mary's district was the site of the ancient "Hampton." The position and limits of the ancient "Hampton" were clearly settled by the walls. Portions of these walls remained in different parts of the town, on the western shore, and elsewhere. These were about  $1\frac{1}{4}$  mile long, and were built in successive times. Originally there was not a wall, but a fosse, and it was a stockaded town. Winchester was walled before Southampton, as in 1148 there was an order to the effect that the castle was to be walled and an enclosure built. The walls round the town did not appear to have been completed for a century or so later. The ancient Bargate was of two dates, the central arch being early Norman date, and the flanks of the time of Richard II. Their ancestors, like themselves now, were in the habit of locking the stable door after the horse had been stolen, for after the terrible destruction Southampton suffered in the time of Edward III. it was necessary to reconstruct the town, and it was interesting to know that the walls were built of Purbeck stone and Isle of Wight limestone. The length of the wall was  $1\frac{1}{4}$  mile, and Leland says there were eight gates, and of these five entrances remained. There was Bargate, the gate of God's House, Water Gate, West Gate, and Blue Anchor Gate, and it was possible that between Blue Anchor Gate and West Gate there was an entrance from the West Quay to the town. The castle was probably built in early Norman or Saxon times. The fortress was referred to in the dispute between the Empress and King Stephen as one to be delivered up to Henry Plantagenet on the death of King Stephen, and Henry de Blois, Bishop of Winchester, and brother of King Stephen, was required to give security for the carrying out of the contract. The castle was now approached by two ways—one from High Street, and the other through a series of unpicturesque alleys from the bottom of West Quay, and accordingly the ancient road leading to the castle could be followed. On the West Quay was a singular example of fortification—a Norman wall behind the arcade. There may have existed along the Quay some Norman houses, and more than one eminent antiquarian thought the arches one of the earliest examples of domestic architecture in the country. In one of the houses an ancient kitchen was found, but the date was not certain; but after the invasion of the French this reputed House of the Kings was looted. The French came to the town in 1338, and held a position for a day and night, but the next day they were driven out by an army raised from the neighbouring county. The French invaded the town on another occasion, unexpectedly, while the people were at mass, and filled their ships with booty, and went away with the ebb tide to Dieppe, where they divided the spoil. The King's House suffered more particularly than others less distinguished, and probably the arches he had alluded to were constructed to give the King's House on the Western Shore a better means of defence. Blue Anchor Lane he took to be an ancient roadway leading from this palace. Passing through the lane they would come to St. Michael's Square, the most ancient part of the town, and which was the ancient "Fish Chepe." In this part was also a portion of a woollen hall. When there was plenty of passing between England and France, Southampton was Norman French, and it was believed that seven hundred years ago Henry II. kept his yacht there. The speaker having alluded to the old building at the bottom of High Street, proceeded to speak of the hospital of God's House, the chapel being dedicated to St. Julian, who was the patron saint of travellers, boatmen, and ferrymen, for whose use it was intended. In addition to God's House they had a hospital, which received various gifts from different townsmen, such as rent left by one, and provisions out of his estate by another, and in the days of the Reformation they amounted to 140*l.* a year, a considerable sum in those days. Queen Philippa persuaded Edward III. to give the grants to Queen's Hall, Oxford, now called Queen's College, and

such had been the increase in the value since, that it was estimated, when the quit rents fell in, the estate of God's House would, in the course of the next forty years, amount to 40,000*l.* In the days of the Reformation Protestant refugees came to Southampton, and Queen Elizabeth gave them the ancient church of St. Julian, and to this day services have been held there in the French language. The hospital itself was now a kind of almshouse, under the management of a warden. Allusion was made to the great abbeys, monasteries, and chantries that formerly were in the neighbourhood, and the privilege of having a fair at Chapel. They had the remains of some distinguished churches, St. Michael's being of various dates, a portion being Early Norman, and some said Saxon. Holy Rood was an ancient church belonging to the Priory of St. Denys. St. Lawrence was a new church, but on an old foundation. All Saints' Church was an ancient church, and probably called All Hallows, but it was rebuilt a century ago. It contained now an interesting series of vaults. Formerly two large pictures of giants, of the date of Charles I., were outside the Bargate, but there was nothing remarkable about them except that they perpetuated a legend of the Saxon times.

## THE INSTITUTE OF ARCHITECTS AND THE OFFICE OF WORKS.

THE following correspondence has passed between the Office of Works and the Council of the Institute of British Architects:—

I.

H.M. Office of Works, July 7, 1882.

Sir,—I am directed by the First Commissioner of her Majesty's Works, &c., to acknowledge the receipt of your letter of the 4th inst., enclosing a copy of a letter which the Institute of British Architects have written to the Metropolitan Board of Works upon the subject of the Hyde Park Corner Improvement, and also enclosing another plan for dealing with the subject.

In reply, the First Commissioner directs me to say that he is surprised that the Institute should, after their interview with him, and without informing him of their intention, have sent a deputation to the Metropolitan Board of Works upon this subject, with the object of inducing that Board to withdraw from the promise which they had given to the Government to contribute the sum of 20,000*l.* to the scheme proposed by her Majesty's Government, and for which her Majesty's Government are responsible.

I am to remind you that it was stated by the deputation which was received at this office on the 27th ult., that the plan which they presented was not approved by the Council of the Institute as a whole; and after the explanation which the First Commissioner gave, pointing out objections to their plan, he was under the belief that the majority of the deputation recognised that its adoption was not expedient. I am also to advert to the expression which the President of the Institute is reported in the papers to have used to the Metropolitan Board with reference to the statue of the Duke of Wellington, to the effect that the present Duke of Wellington and the public would be under apprehension lest the statue should go to the foundry, and I am to remind you that nothing was said by the First Commissioner to your deputation which could justify any such apprehension. He is also surprised to perceive that in their communication to the Metropolitan Board they should have stated that the plan of the Office of Works does nothing to relieve the block of traffic at the junction of Piccadilly and Hamilton Place, when he had distinctly pointed out to the deputation that it was already his intention to widen Piccadilly at this point.

The First Commissioner learns that the Committee of the Metropolitan Board, to whom the matter was referred, have unanimously declined to depart from their previous decision or to adopt the plan recommended by your Institute.

With respect to the amended plan now submitted by the Institute the First Commissioner is of opinion that it is open to serious objection, and he is unable to hold out any hopes that it will be adopted.—I am, &c. (Signed) A. B. MITFORD, Secretary.

The Secretary, Royal Institute of British Architects.

II.

Royal Institute of British Architects,  
July 18, 1882.

Sir,—We have the honour to inform you that the Council of the Royal Institute of British Architects, at their meeting held yesterday, had under consideration your letter of the 7th inst., and they have consequently directed us to express regret that the action taken by them in reference to the proposed alterations at Hyde Park Corner should have been distasteful to the First Commissioner of Her Majesty's Works and Public Buildings. In the course pursued they have been actuated by a sense of duty and an earnest desire to assist him in the laudable endeavour to achieve a great and necessary Metropolitan improvement.

The real point at issue is whether, to quote your own words, "the scheme proposed by her Majesty's Government, and for which her Majesty's Government are responsible," is deserving of

support and commendation both as regards its architectural effect when executed and the general improvement of the locality. The Council of the Institute, therefore, do not consider it necessary or desirable to enter upon a discussion of the several subsidiary matters contained in your letter, further than to inform you that the resolution to memorialise her Majesty's Office of Works and the Metropolitan Board of Works on the subject of the proposed alterations at Hyde Park Corner was unanimously passed at one and the same meeting—namely, that held on the 19th ult. But they desire to repeat and amplify their opinion that, while the general idea of the improvement proposed by her Majesty's Government merits approbation, the scheme itself is defective in two main particulars.

First, the official model and published plan indicate no increase whatever to the width of Piccadilly at its junction with Hamilton Place, and although the First Commissioner stated to the deputation of the Institute, which he was good enough to receive on the 27th ult., his intention of widening Piccadilly at that point, he admitted that the proposed increase would be to the extent only of the width of the foot-pavement. This, in the opinion of the Council, is inadequate. They therefore venture to maintain that the plans they presented possess in this respect a material advantage over that of the Government—an advantage to which, in the public interest, they would again direct serious attention. Secondly, the contemplated removal of the Arch from its present position would destroy a well-balanced architectural group, involving, moreover, an expenditure which, in their opinion, would have little to recommend it unless thereby the artistic reputation of this country were relieved from a merited reproach. But the First Commissioner has held out no expectation of this; for when the deputation waited upon him he was understood to say that although the Arch would be removed, and re-erected elsewhere, there was no present intention of placing the Wellington statue upon an appropriate pedestal.

We are further instructed to express the hope of the Council that the First Commissioner, after renewed consideration of this subject, will consent to modify the official scheme for the improvement of Hyde Park Corner, in order that when executed it may not only efficiently provide for the exigencies of the public traffic, but also conduce to the architectural embellishment of an important part of London.—We are, &c.

(Signed) J. MACVICAR ANDERSON, Hon. Sec.

WILLIAM H. WHITE, Secretary.

The Secretary, her Majesty's Office of Works, &c.

III.

H.M. Office of Works, July 20, 1882.

Sir,—I am directed by the First Commissioner of her Majesty's Works, &c., to acknowledge the receipt of your letter of the 18th instant in regard to the proposed alterations at Hyde Park Corner.—I am, &c. (Signed) A. B. MITFORD, Secretary.

The Secretary, Royal Institute of British Architects.

## LEGAL.

Court of Session, Edinburgh—July 21.

(Before Lord KINNEAR.)

SUBSIDIARY CONTRACTS.

Decision has been given in an action which was raised by James Ritchie, builder, St. Andrews, against William Davidson, hotel-keeper, and John Gamble Patterson, clubmaster there, for the balance due under a contract for the mason work of two villas at the Scores of St. Andrews. The contract price was 1,646*l.*, and pursuer claimed 257*l.* for variations on the specifications, 21*l.* for jobbing—together 1,924*l.*; but gave credit for 1,397*l.* already paid, and 132*l.* for articles supplied by the defenders; so that the amount sued for was 395*l.*, with interest. The defenders said that the only offer accepted by Mr. Milne with their authority was one for 1,447*l.*, and that he had no authority from them to accept an offer for 1,646*l.*

Lord Kinnear, after hearing evidence, said, in giving judgment, that the architect had authority to accept the second contract, and that the principal was responsible for the contract price. The work was begun and completed by the pursuer with the knowledge of the defenders in terms of the written contract and on the faith of it, and it was not said that the defenders made any particular inquiry as to the terms. The buildings were now finished, and then came the question what they were worth. The proof of this was not very satisfactory, but it was spoken to by three witnesses. As to the extra work, the conditions of the contract must be adhered to. They were that the extra account should be adjusted under it. The defenders admitted their liability for this account, so that he was relieved of the difficulty of further considering that matter. His Lordship gave decree for the amount concluded for, and found the defenders liable in expenses.

The Custom House in Lower Thames Street has, it is said, been sold for 2,000,000*l.* to the Corporation of London, in order to extend Billingsgate Market.

## CHURCH BUILDINGS AND RESTORATION.

**Ribchester.**—The ancient church of Ribchester has formally been reopened. The church was known to have been in existence in the year 1291, and remained unchanged materially, consisting of nave, side aisles, chancel, porch, and low tower. The village was a place of importance in the old Roman times, and the Bishop of Manchester, in his sermon at the opening ceremony, said:—He supposed it was the abundance of water, that first necessity of life, which led the old Roman soldiers to pitch their tents there some 1,600 years ago, and to choose that place for their encampment. Civilisation followed in their train, and the blessings of Christianity had been known in the village for many generations. He did not know who was the first evangelist who came preaching the gospel of Christ on the banks of the Ribble, but it was said in ecclesiastical tradition that Paulinus, the great Saxon missionary bishop of the first half of the seventh century, was the first visitor, and according to ancient records a church fabric existed on that spot more than 600 years ago. The restoration of the chancel just finished led him to hope that the work would not stop there. He hoped that the nave, in which there were many features of interest, might in time also be restored to something like its pristine beauty, proportion, and noble simplicity. He was told it would cost about 3,000*l.* to make a complete and thorough repair, but it need not all be done at once. Perhaps they might begin with the seats, which he was told were not the best or most comfortable, or the roof, which was getting shaky and dangerous, as old roofs, including that of their own Cathedral at Manchester, were in the habit of doing. He hoped, however, that an earnest effort would be made in this direction, and that they would make the old church of Ribchester in this nineteenth century something like what he imagined it was six hundred years ago. Those who built churches in the earlier days did not scamp their work. They built soundly and substantially, and those who had an eye for such things would admit that our forefathers, with far more imperfect appliances and without our scientific knowledge, managed to erect much more beautiful and durable edifices than we could build now. Though he did not put the restoration of old churches among the very first necessities of the age, still, when he saw an ancient church like that, and heard that it was getting into a somewhat precarious and unsound condition, he could not help thinking that money might be spent in a great deal worse manner than upon the restoration of churches.

**Featherstone.**—The church of All Saints, Featherstone, near Pontefract, has been reopened after being closed for the past two years, while undergoing a thorough restoration. Messrs. Healey, architects, of Bradford, have carried out the restoration. The south portion of the church has been entirely rebuilt, and the tower partially restored. There are three bells in the tower, the earliest of which, inscribed to St. John, dates from pre-Reformation times, and the other two (St. Peter and St. James) are of later dates.

**Upholland.**—The foundation-stone of a new chancel for the church of St. Thomas the Martyr, Upholland, has been laid. The addition to the old church is 32 feet by 22 feet, and, with the restoration of the interior of the church, which has been completed, will involve an expenditure of 2,000*l.* The plans have been prepared by Mr. Basil Champneys, architect, of London, and the chancel will be built in the characteristic style of the ancient structure.

**Widnes.**—The memorial-stones of a new Wesleyan chapel, Oakland Street, have been laid. The building will be 58 feet by 50 feet, and there will be two entrances, one on each side of the front, contrived so as to form transepts. Galleries will run round three sides of the building, and the staircases from them will open into the transepts. The pews will be of stained, varnished deal. In the transepts two vestries will be constructed. The chapel will be built of patent bricks; white stone will be used in the string-courses. The building will be roofed with Buttermere sea-green slates. The total cost is estimated at 2,500*l.* Mr. H. Isitt is the architect.

**Newent.**—A survey of the condition of the parish church, Newent, has been made for the parish authorities by Messrs. Middleton & Son, architects, of Cheltenham. Messrs. Middleton report that the restoration of the windows on the western side is urgent because of their dangerous state of dilapidation; that the aisle needs extensive repairs to the roof, floor, fittings, windows, and exterior walls; and the porch needs renovation. The cost of these necessary repairs is estimated at between 500*l.* and 600*l.*, and an appeal is to be made to the public for funds to carry out the work.

**Salford.**—The restoring the external structure and making some alterations and additions in the interior of St. John's Roman Catholic Cathedral, Salford, has been begun. The Cathedral was dedicated and opened on August 9, 1848. The original cost of the building and site was about 20,000*l.*, the architects being Messrs. Wightman & Hadfield, of Sheffield. The work of restoring has commenced at the west front of the Cathedral, the very beautiful

design of which is pretty much a reproduction of the west front of the celebrated Howden Church, in the East Riding of Yorkshire. The massive buttresses, spire turret, and other parts of the building will be entirely repointed and put in repair. When the exterior is completed the interior will be beautified, and some additions made in the structure, the most notable of which will be the raising of a new altar in the Lady Sanctuary, designs for which have been prepared by Messrs. C. W. & P. P. Pugin.

**Cullercoats.**—The foundation-stone of a new church will be laid on the 4th prox. The Duke of Northumberland has given the site and undertaken the cost of erection, amounting to about 18,000*l.* Land has also been given as the site of a vicarage-house, towards the building of which the Ecclesiastical Commissioners have contributed 1,500*l.* Mr. J. Pearson, R.A., is the architect, and Mr. W. Scott, of Newcastle-on-Tyne, the builder.

**Norton.**—The church of Norton, notable as being the burial-place of Chantrey, has been reopened after undergoing thorough restoration from the designs of the late Mr. Street, R.A., and completed under the direction of Mr. A. E. Street, M.A. The work in the chancel and in the Blythe Chapel adjoining is due to members of the Cammell family. A large stained-glass window, executed by Mr. E. Frampton, of 82 Buckingham Palace Road, London, and representing the old and the new Dispensations, is fixed at the east end. Oak is used for the roof of the chancel, and all the fittings here are of carved oak, including the choir stalls, screen, altar-table, and reredos. Encaustic tiles and stone are used for the flooring of the chancel, while the step to the altar-table is of Derbyshire fossil marble. The chancel arch, which was in a dangerous condition, has been rebuilt, and the three windows in the Blythe Chapel, which were previously partly built up, are now opened down to their original level. A new organ-chamber has been constructed by piercing the north wall of the chancel. A brass lectern has been presented by Mrs. Bagshawe in remembrance of the late Mr. Street. The heating is by means of hot-water pipes with gratings, supplied by Messrs. Newton, Chambers & Co., of Sheffield; the floor under the seating is laid with Gregory's patent wood-block flooring; and the nave and aisles, tower and porch, have flooring of red and black tiles from the works of Mr. Godwin, of Lugwardine. The west window in the tower has been filled with fine stained glass by Messrs. Ward & Hughes.

**Coggeshall.**—The foundation-stone of a Wesleyan chapel has lately been laid. A new building being required, Mr. S. W. Horton, of East Grinstead was commissioned to prepare plans. Tenders were invited, and that of Messrs. M. A. Gardner & Son, amounting to 785*l.*, was accepted. The building is to accommodate over 200 persons, its proportions being 50 feet by 27 feet. A gallery will be erected at the entrance. The chapel will be seated with benches of yellow deal. The platform and gallery front will be of pitch pine.

## SCHOOL BUILDINGS.

**Gateshead.**—A public meeting to inaugurate the opening of the new Board schools just completed in South Street, Durham Road, Gateshead, was held on the 20th inst. The new buildings stand in a densely-populated and rapidly-increasing district. The schools are arranged in three departments for 284 boys, 284 girls, and 310 infants, and in addition there are two rooms for pupil teachers' classes, for 30 each; the total accommodation provided being for 940 children. The cost as completed has been 4,150*l.*, or 4*l.* 10*s.* per scholar (the architects' estimate to the Board being 5*l.* 5*s.*), and the works have been finished in two months less than the specified time. Mr. Edington has acted as clerk of the works, the contractor being Mr. Alexander Thompson, of Gateshead, and the buildings have been erected from the designs and under the superintendence of Messrs. Oliver & Leeson, architects, Newcastle.

**Halifax.**—The Halifax School Board are about to provide accommodation for 100 more scholars at St. Thomas's School, Claremount the plans for which have been prepared by Mr. R. Horsfall. The extensions will consist of a new wing added to the middle of the west or lower side of the large room. It will be divided into two classrooms by revolving shutters, and as these can be lifted, the new room can be used as extra accommodation to the large room. The area will be 42 feet by 24 feet. There will be a covered playground underneath.

**Denton.**—The Russell Scott Memorial Schools were opened on Saturday last. The style is free Gothic, and the buildings were designed by Mr. P. Pons, architect, of Manchester, and erected under his supervision by Messrs. Holmes & Webster, Ashton-under-Lyne. On the ground floor are a kitchen and vestry, connected with the present chapel; the girls' entrance and staircase, leading to their classrooms; an infants' schoolroom, 28 feet by 27 feet, and infants' classroom; also a boys' main entrance, with principal staircase; and a fives court, 24 feet by 20 feet, with all requisite accommodation. The first floor consists of a girls' class-

room, 26½ feet by 18½ feet; also a boys' schoolroom, 40 feet long and 27 feet wide, with principal and secondary staircases. Over the main staircase is a tower, with high-pitched roof, which is utilised by providing a library, storeroom, staircases, and room for water cisterns, which supply the whole of the establishment. The walls of the principal rooms and staircases are lined with white glazed bricks and coloured bands. The girls' and infants' classrooms can be shut off from the main schoolrooms by revolving shutters; and in the girls' chief classroom, by lifting the shutters a platform is formed 3 feet 6 inches above the level of the boys' schoolroom, with a 15-foot opening, making a proscenium, and giving a total length to the room of 59 feet.

**Workington.**—The memorial-stones of a Primitive Methodist chapel and school have been laid. The style adopted for the building is Gothic. The site is in John Street, nearly opposite the Board schools. The work is being carried out by Mr. L. Fergusson, contractor, from the designs of Mr. William G. Scott, architect, of Workington. The cost, it is estimated, will be about 1,700*l*.

**Bedford.**—The ceremony of opening the High and Modern School for Girls, erected for the Harpur Trustees, has lately taken place. Mr. Basil Champneys, of Buckingham Street, Strand, is the architect. The school is a two-storeyed building in early Jacobean style, constructed of red local brick with Ancaster stone dressings. The plan resembles the letter E, the two wings of which are respectively for the High and the Modern School, both schools including ample class-rooms, and the High School a library, music-room, and laboratory. These are separated by a large hall, which can be used by the two schools, either in common or alternately, by means of sliding shutters, and which occupies the centre of a frontage over 200 feet in length. The contract for the work was taken by Mr. S. Foster, of Kempton, for 10,600*l*. Mr. W. H. Williams was clerk of works. The desks and school furniture were supplied by Messrs. G. M. Hammer & Co., of the Strand, London.

### NEW BUILDINGS.

**Ayr.**—A new hospital has been erected at Ayr on the Holmston Road, near the Kyle Union Poorhouse. The building, which has been designed in the Queen Anne style, has a front elevation of 400 feet, and is in the main or central portion three storeys high. The general hospital has accommodation for 44 patients, while the fever hospital, which is detached, has ward accommodation for 20. On the ground-floor are board-room, dispensing and doctors' consulting rooms, the matron's and nurses' quarters being on the second and third floors. It is built of Ballochmyle red sandstone. The cost is about 8,000*l*. Mr. Murdoch, Ayr, was the architect.

**Newcastle-on-Tyne.**—Alterations and improvements have lately been carried out at the Assembly Rooms, Westgate Road, under the direction of Mr. R. J. Johnson, of the firm of Messrs. Austin, Johnson & Hicks, architects. One of the chief works has been the improvement of the means of ventilation. Mr. R. Whichello has executed the mason and joiner work, Messrs. Walker & Emly executed the ironwork and plumbing, and Messrs. Richardson carried out the works of redecoration.

**Forres.**—A block of buildings has just been completed in the High Street for Mr. Gill, postmaster. The building has been designed by Mr. John Rhind, architect, of Inverness, in the Scottish baronial style, and comprises two large shops—each with back shops and ample cellarage—with the post-office on the ground floor. The entrance to the post-office is by a covered passage, by which access is obtained to the garden ground at the back. In this passage also are the doors of two dwelling-houses, into which the upper portion of the building is divided. Bay windows are carried up two storeys in height, and rest on corbels over the lintels of the shop doors, and are finished with traceried parapets at the top. The mullions are ornamented with carved trusses, and the panels below the windows have moulded balusters, and shields with the heraldic bearings of Forres, &c. Above these are gables in which are the windows of the upper bedrooms. The contractors for the work were—Messrs. Donald Macleod, Inverness, mason; Alex. Laing, Forres, carpenter; John Taylor, Forres, plumber; Alex. Forbes, Forres, slater; Adam Ross, Forres, plasterer; Wm. Smith & Son, Inverness, ironwork; John Alves, Forres, painter.

**Fowey.**—The foundation-stone of the new Fowey Hotel was laid on Saturday last. The hotel is to be built on a site on the Esplanade, commanding a view of the harbour and sea. It will consist of a ground-floor and five storeys, with a billiard-room attached at the western end. Mr. A. S. Clunes is the architect, and Mr. J. Smith, of St. Austell, the contractor.

**A New Church** is projected for Matlock Bank, to be erected at a cost of 6,000*l*., furnishing accommodation for 600 persons. It is not, however, contemplated to build more than the chancel and part of the nave, at a cost of about 3,000*l*., leaving the remainder of the nave, together with tower and spire, to be completed as soon as the necessary funds are obtained.

### ENGINEERING WORKS.

**Ship Canal, Mull of Kintyre.**—The Duke of Argyll was present on Tuesday at Glasgow at a large and influential meeting of gentlemen favourable to the improvements of the east and west lochs of Tarbert, in the county of Argyll, and to the formation of a canal between the two lochs. The proposal submitted to the meeting is to form a canal through the Mull of Kintyre, and thereby provide a direct outlet for shipping traffic from the Firth of Clyde to the west and north of Scotland. His Grace, who presided, explained that the canal would be two miles in length, and the saving it would effect for vessels going to the west and north of Scotland would be about 115 miles. The channel was proposed to be 50 feet in width and upwards of 18 feet in depth, and the cost was estimated at from 150,000*l*. to 200,000*l*. Calculations had been made showing that vessels to the amount of about 500,000 tons a year will be expected to take advantage of the canal, and, estimating the charge for the use of the canal at 6*d*. per ton, this would give a revenue of 12,000*l*., which was considered a good return upon the outlay. Resolutions were afterwards passed in favour of the formation of the canal, and a large and influential committee was formed to carry out the undertaking. At a meeting of the Committee held afterwards, Mr. J. Wyllie was appointed to carry out the organisation of the Company. The preliminary details were adjusted, and a large portion of the capital was subscribed.

### ARCHÆOLOGY.

**The Salford Charter.**—The deed from the first Earl of Chester, by which Salford secured the rights of a free borough, has been translated by Mr. T. N. Morton. The charter contains twenty-six clauses. It provides that each burgess may hold one acre of land with his burgage, and shall pay twelve pence per year for rents; each burgess refusing to answer the plea of the Reeve in the Laghe-moot forfeits twelve pence, and the same penalty, with an additional fourpence for the reeve, if he neglects the plea of another burgess; if one burgess strikes another he may make peace in view of the burgesses, saving the right of the lord to twelve pence; the burgesses were not to answer pleas save in their own Portmannemoot; cases of theft were to be tried by the prefect saving the lord's right; if a complainant makes no appearance for three days, he shall be at the mercy of the lord of the borough; no burgess to bake bread for sale except at the bakehouse belonging to the lord of the borough; the burgesses are to grind at his mill, if he have one; the burgesses can choose the reeve from themselves "whom they wish;" the burgess might sell or mortgage his tenement, the nearest heirs having the preference; if he have no heirs he can leave his burgage and chattels to whom he pleases, but it must not be alienated in religion; burgesses might arrest their debtors; chattels of burgesses might not be detained for any other debts than their own; burgesses were to be free of all tolls whether at fair or market, except the Sal toll; whoever broke the assize of bread or beer was to "suffer forfeiture of twelve pence three times, and the fourth time he shall perform the assize of the town;" the burgesses were to have free pasture in the wood, plain, and pastures belonging to the town; the burgesses might "take reasonably in the aforesaid wood all necessities for building and burning;" the wife might plead in the absence of the husband, and the husband for his wife and family; the widow was to remain in the house with the heir during her widowhood; when a burgess died all that was to be given to the lord was a sword, a bow, or a lance; no one was to exercise the calling of shoemaker, currier, fuller, or any such, except in the borough; the rents were payable threepence on each of four specified days; "all the above pleas to be decided before the bailiffs of the earl upon view of the burgesses."

### ART WORKMANSHIP.

**Decoration of Lerwick Town-hall.**—The heraldic decorations of the front of this building, which have been entrusted to Inverness sculptors, will occupy the wall space above the windows of the ground-floor, and below those of the main hall above. They consist of four elaborately-carved stone panels, designed by Mr. Ross, architect, each of which bear three armorial shields—the centre one in each panel bearing a national emblem, and the side ones the arms of noble families intimately associated with the history of the islands. The first panel carries on its centre shield a Norse dragon ship; the right hand shield bearing the arms of the Earl of Morton; the left one those of the Earl of Zetland. The second panel bears—centre shield, the lion of Norway; to the right the arms of the Earl of Orkney; to the left, those of the Earl of Caithness, representing the line of the old St. Clair Earls. The third panel bears—centre, the lion of Scotland; to the right the arms of the Stuart Earls; to the left those of the Barons St. Clair. And the fourth panel bears—centre, the galley of Orkney (the ancient shield of the earldom); to the right the arms of Bothwell, Duke of Orkney and Shetland; to the left the shields of the St. Clairs of

Rosslyn, the descendants of the ancient line of earls. The ground of each panel, being the interspaces between the shields, is filled in with ornamentation of devices of delicate foliage, having special reference to the shields. Several additional donations of stained-glass windows have been received from local public bodies and other donors. The Earl of Zetland has presented one of the largest stained-glass windows of the main hall, the companion to which is the window which the Sheriff of the county some time ago intimated his intention to present. One of these windows—the execution of both of which has been entrusted to Messrs. Ballantyne, of Edinburgh—will contain full-length figures of King Harold the Fair-haired, and of Eystein, Archbishop of Thronhjelm, the metropolitan prelate of the ancient see of Orkney and Shetland, who died 1158. The other will represent Earl Rögnvald of Orkney—the first earl of the earldom—and Bishop William the Old, the first bishop of the diocese of Orkney and Shetland. King Harold—who visited Shetland A.D. 870, after his subjugation of Norway—and Earl Rögnvald will be represented in full armour, crowned and coroneted, with the arms of Norway under their feet; the prelates in ecclesiastical vestments, mitred, and bearing croziers. Besides the oriel window, there are four windows in the front façade of the great hall, of two lights each, the subjects of all of which are noted personages connected with the early history of the islands, who will be represented as full-length figures, in the costumes of their day. These windows are to be executed by Messrs. Cox, Son, Buckley & Co. In the oriel window of the great hall is to be placed the medallion presented by the city of Amsterdam; and in four small lancets below the rose window, the design of which is not decided on, will be represented the armorial bearings of some of the leading county families. Morton Lodge of Freemasons is also to present a stained-glass window for the principal staircase leading to the main hall, and other donations are expected.

### ART SCHOOLS.

**Architectural Museum.**—The report which has been presented to the subscribers says that the usual effects of the deficiency in the amount of the annual subscriptions would have been felt but for help received during the year, viz.—1st, a generous donation from the Gilchrist Educational Trust of 25*l.*; 2nd, a donation from Mr. Wyatt Papworth of 5*l.* for a special purpose, that of cleaning the casts, and various other donations from kind friends to the amount of 5*l.* 3*s.*; 3rdly, towards the end of the year the balance of the Scott Memorial and the interest during its investment was, according to the decision at the Chapter-house meeting, held immediately after Sir Gilbert Scott's death, handed over as an endowment of art teaching at the Royal Architectural Museum. This was the cause of the large balance shown in the balance-sheet. On the other hand, the subscribers have to be reminded that at the end of the year there were two accounts unpaid, viz.—88*l.* to the builder for a very successful and useful new classroom, only opened in the beginning of that year, and 34*l.* to the solicitor, being the last remaining item of the expenses incurred in the purchase of the lease. These have been paid in the early part of this year, 1882, so that now, at the date of this report, there are no liabilities, but still the ever-recurring difficulty of insufficient subscriptions has to be met. The results at this year's National Competition, which are just made known, are: one silver medal for a design in model, sent in in competition for the Plasterers' Company's Prize, and which also gained the second prize, making the fifth year in succession that students from the school have gained one or other prize from that Company; two bronze medals, one for a design for an iron gate, and the other for studies of mosaics; and two National book prizes, one for designs for stained glass, and one for painting from life; in the second grade Local Examinations 27 certificates have been obtained and 10 prizes. The school numbers are well maintained, there having been 96 students in the evening class since September last, 25 in the life class, and eight in the ladies' class.

**Messrs. Chubb & Son**, the patent lock and safe makers, are about to transfer their lockmaking factory from Wolverhampton to the large Patent Safe Works built by them a few years ago in Glengall Road, Old Kent Road, London. At the London works they have room for a thousand workmen, and already possess extensive boiler and engine power, together with a quantity of powerful machinery. They propose to add special machines for making certain parts of their locks, leaving the more complicated and delicate work to be done, as now, by hand. Messrs. Chubb have made about one million locks and many thousands of safes since commencing business 64 years ago. The average length of time each workman (including boys) has been in their employ is 17 years.

**A Large Party of Gentlemen** on Friday last week were conveyed by train over some half-mile now completed of the new Inner Circle Railway. The distance traversed was from Aldgate Station to Trinity Square, Tower Hill.

### GENERAL.

**Mr. C. N. Armfield**, of Whitby, was appointed architect to the new church to be built on the West Cliff, Whitby, at a full meeting of the committee held in Hagersgate House, at which the Rev. Geo. Austen, M.A., presided.

**Messrs. Rollinson & Son**, architects, of Chesterfield, have prepared plans for the extension of the school at Hackenthorpe.

**Mr. D. W. Stevenson, A.R.S.A.**, has obtained the commission for the statue of Robert Tannahill, the poet, which is to be erected in Paisley. The second prize was awarded to Mr. W. G. Stevenson, of Edinburgh, and the third to Mr. J. E. Christie, of London.

**Sir William A. Rose & Co.'s Premises**, Vintry Wharf, Anchor Alley, Upper Thames Street, were destroyed by fire on Saturday night. The cause is unknown. It has been announced that the premises were used for rape and colza oil refining, and are in no way connected with Sir W. A. Rose & Co.'s general oil and colour business, which is being carried on as usual at Queenhithe.

**Mr. Lynam**, architect, of Stoke-on-Trent, has prepared plans for the proposed new hospital at the Stoke-on-Trent Workhouse.

**The Tender of Mr. Hirst**, of Sunderland, has been accepted for the construction of a large graving-dock at West Hartlepool.

**Sir E. Bates**, it is said, intends to convert the premises used as a sugar refinery, and lately purchased by him, at Plymouth, into blocks of artisans' dwellings.

**The Monument to Sir Edwin Landseer**, by Mr. Woolner, R.A., has been placed in the crypt of St. Paul's, near the tomb of the artist, and in the next vault to the one where Sir Christopher Wren is buried. It consists of a medallion portrait in profile, below which is a bas-relief from the well-known design of *The Shepherd's Chief Mourner*.

**The Board of Trade** has sanctioned the proposed plans for the extension of Eyemouth harbour, and negotiations are on foot to obtain the money necessary for the carrying out of the works.

**The Hove Commissioners** have approved of a recommendation of the Sanitary Committee that steps should be taken to provide 6,000*l.* for the purpose of erecting a sanatorium on land purchased by the Board at Hangleton Bush.

**A Carved Oak Reredos**, designed by Mr. J. Oldrid Scott, has been erected in Bangor Cathedral. The work has been executed by Messrs. Thompson, of Peterborough.

**A Railway Station** for passenger and goods traffic is being erected at Fleetwood. The cost will probably reach 120,000*l.*

**The Bournemouth Improvement Commissioners** have decided to obtain plans from Mr. Birch, C.E., for the erection of shelters on the pier at a cost not exceeding 2,000*l.*

**The New Corn Exchange** at Ipswich was opened on Wednesday last. It has cost about 35,000*l.*

**The Wolverhampton Borough Accountant** has prepared a statement of the moneys hitherto expended and received on the alteration of streets in connection with the Artisans' Dwellings and Street Improvement Scheme, which shows that up to the present the net expenditure has been 245,000*l.*

**A General Meeting** of the London and Middlesex Archaeological Society will be held at the church of St. Olave, Hart Street, on Saturday the 29th, at 2.30 P.M., when papers will be read on "The History and Antiquities of St. Olave's," by the Rev. A. Povah, M.A., and "The Worthies connected with the Church," by Mr. Henry B. Wheatley, F.S.A.

**The Somerset Herald** has prepared a design for the arms of the new City of Newcastle. It consists of the ancient device of the three silver castles on a red field, and is surmounted (on what is called a chief) first, with a representation of the cross of St. Cuthbert, as commemorating the see of Lindisfarne; and secondly, of the see of Durham, out of which Newcastle has been formed, thus giving in heraldic arrangement a history and chronology, as it were, of the bishopric. The design has been approved of by the City Council.

**The Paisley Improvement Commissioners** have resolved to purchase no more old properties. They still hold sites from which old buildings have been cleared away which are valued at 22,500*l.*, and when the improvement operations now in progress are completed there will be a total deficit of 7,200*l.*, which must be met by assessment.

**Messrs. Underhill & Co.**, of Upper Thames Street, have issued their "Architects' and Builders' Pocket Compendium" for 1882. It contains illustrations of the innumerable articles supplied by the firm, and as the prices are attached the volume will be found invaluable when estimates are being prepared. It has, too, an advantage of being portable in size, and consequently differs from the majority of similar publications. All architects, surveyors, and builders should obtain the volume.

# The Architect.

## THE PROPOSED COMPETITION FOR THE OFFICES OF WAR AND ADMIRALTY.

R. SHAW LEFEVRE has virtually announced the intention of the Government to invite a competition of architects for the new Offices in Whitehall. Lord ELCHO expressed the further hope that it would be an open competition, and the First Commissioner replied in effect that his leaning was also that way. Some of the best architects, he

said, would decline to engage in a perfectly open contest, but the new system of a double competition was under consideration—as, we presume, a means of overcoming this difficulty.

If the architectural profession, or even the professional press, is to discuss this matter before instead of after the event, it must be done with some sort of apology to the Government for the exceedingly untoward action recently taken by the Council of the Institute of Architects with reference to two dignified national projects, one of which was in fact the selection of the site for the very buildings now in question. We know quite well what is said of the bird that fouls its own nest, but it is so much more than doubtful just now whether the Council Room of the Institute deserves to be respected as the nest of English architects in any sense that is not merely nominal, that it would be useless for us to pretend to regard it as an offence against either loyalty or good taste if—on the part of architects generally, and indeed on the part no less of the general body of the Institute itself—we take leave to repudiate the agency of Mr. HORACE JONES, President by rotation, and the friends who have supported him from a mistaken idea of loyalty, and to point out the circumstance that the Institute has never been consulted at all, directly or indirectly, and that the assumption by the Council of the right to lecture the Government without consulting the constituency at large, is an act of mere usurpation. The fact that the Council's business is "to manage the affairs of the Institute"—that is to say, to lay out its everyday arrangements as an executive committee—is, for some reason that no one can understand, confounded by the members of the present Council with the doctrine that they are to perform arbitrarily all the functions of the Guild; which is absurd. Blunders like those which have lately been committed are the natural consequences of such unconstitutional policy; and Mr. SHAW-LEFEVRE and his advisers, as real and not sham public men, will easily see how the matter stands, when they are made aware of the simple circumstance that the measures which they have been so indignantly complaining of are the proceedings of a small close committee which have never been submitted to any constitutional test of general opinion.

With regard, then, to the intended competition, we must certainly acknowledge, even after all that has been said of late in this journal and elsewhere against competitions on principle, that there are few persons, if any, who would object in practice to the proposition that in the case of a great national work of monumental character, competition of some form or other is the right thing. There are three reasons for this, all of the greatest weight: firstly, the Government is entitled and bound to ask the architects of the country at large for the best suggestions they can produce; secondly, the architects, as an act of public loyalty, may be expected to recognise, even at a sacrifice, the obligation here imposed upon them; thirdly, every architect in the kingdom is entitled to aim at the distinction which may be acquired by the production of a successful design, or indeed of one of a selection of successful designs. Government work on the grandest scale differs from all other work in these respects, and no one need deny himself the pleasing duty, or be denied the possible advantage, of competing, even at the expense of the competitors, on this peculiarly high ground. We may add one other consideration; the tendency of the age in all public work is to enlarge the limits of competition, using the term in its widest sense. The time for retaining a Sir ROBERT SMIRKE to build the Houses of Parliament has therefore gone by; there are half a dozen or half a

score of comparatively unknown BARRYS always at hand, and each of them has his Sir EDWARD CUST—or his Lord ELCHO—in the House of Commons or in the Ministerial ante-chamber. It is not necessary, even, that we should press the commercial question itself in this particular field; the men whom we may persist in calling by the name of fools for engaging at their own cost in the random competitions of advertising committees we may yet encourage without inconsistency to spend their money freely in the noble contest which has national honour for its reward.

As for the particular form which the proposed competition ought to take, it is to be remembered that the Government has already tried very fairly both the rival modes of the open, public, or universal competition, and the select or limited competition; indeed, it has perhaps to be also borne in mind that both modes have turned out rather unsatisfactorily. There is no urgent reason for going further into the question at present, but it would be vain to deny that Sir GILBERT SCOTT's Home and Colonial Offices are not a highly popular production, or to disguise the fact that the new Law Courts are already spoken of with grave apprehension by the practical lawyers who are to occupy them, and who will probably prove to be much less mealy-mouthed than the officials of Downing Street. The blame for this want of success we have been accustomed to lay at the door, not of the architects, but of those meddlers with architecture who persist in spoiling the game sooner or later, not only of every Government competition, but of every successful competitor who carries off the prize. How far we ought to hope for better things in the new venture now in hand we cannot presume to say; but hope springs eternal in the architectural breast, and we may at any rate try once more.

We do not think Mr. SHAW-LEFEVRE is quite right in supposing that architects of high standing and merit will refuse to join in a public or open competition for so very important a work as the one he has now in hand. In the last case of the kind, that of the offices for War and Foreign Affairs five-and-twenty years ago, the best men of the day went into the contest cheerfully. Their object, indeed, was a simple wish to do honour to the occasion, and to seek for themselves honour rather than payment. A very large number of premiums were awarded and paid, but these were not any more adequate in amount than they usually are. A correspondingly large number of competitors were consequently more or less disappointed. But in the end, even when SCOTT was appointed to carry out the work, on the principle, as Lord PALMERSTON said, that the horse which came in always second had been awarded the stakes, very little grumbling was heard. The honour of having received a high place was accepted as the real reward by perhaps all concerned.

Compared with this instance, the competition for the Law Courts and the National Gallery cannot very well be called either a more dignified or a more profitable transaction. A certain number of architects were invited to prepare competition designs for 800*l.* apiece. Some of these—Mr. GIBSON, for instance, and the late Mr. SOMERS CLARKE—declined the invitation; but this was quite understood to be not on any ground of their own superior personal consequence, but rather as the result of a too candid calculation of their chances of success. Certain of the other persons selected no one could regard as worthy of the compliment. Some of them touted openly in the exhibition-room. Several of the designs were almost childish in their deficiencies. The conclusion of the whole adventure was most undignified, most unprofitable (except to Mr. STREET alone), most unsatisfactory to the profession at large. As if to put the matter in the worst possible light, Mr. EDWARD BARRY had to be bought off with a promise of the National Gallery which was never fulfilled; Mr. WATERHOUSE was rewarded with the South Kensington Museum, upon which he had no claim whatever, and the succession to which could be fairly claimed two deep when Captain FOWKE died; and Mr. STREET's appointment, if we may speak plainly, was virtually a fluke, and was the occasion of as unseemly a squabble as if the subject had been a Union Workhouse.

Of the two precedents, it will probably be the opinion of most competent authorities that the open competition is in every way the best; and if the principle of the preliminary contest with sketches should be accepted, we can scarcely deny that the occasion would be well worthy of any additional waste of trouble and expense which would be involved. The appointment of adjudicators, however, may be expected to

cause a little more uneasiness than usual. The Government have never yet appointed architects as sole judges; what is called a mixed commission is the rule. Professional adjudication no doubt has its faults, but mixed commission adjudication has nothing but faults. A tribunal of this sort, composed of members of Parliament and their familiars, has no more real value in architectural work than a parish vestry. It is to be hoped that Mr. SHAW LEFEVRE will at any rate not go very far without ascertaining in some way the professional opinion of experienced architects. If he should be disposed to make up matters with the Institute Council, and if they will agree to consult their constituents as they ought always to do, we should say he would do wisely to lay the case before the Institute without delay.

### ANCIENT GREEK DRESS.

GREEK dress, as it appears in all its beauty of folds on the goddesses of the Parthenon or in the balustrade of the Temple of Victory at Athens, has often been the subject of inquiry as to how and by what materials such schemes of drapery could be obtained. There has never been any doubt but that the Greek artist had considerably idealised the reality from which he started, whether it was what he saw in daily life or what he succeeded in arranging on a model. And there ought not to be any doubt that, compared with a modern sculptor, he stood at this great advantage—that from the earliest times in Greece the treatment of drapery had been a constant study, and that even before the time of PHEIDIAS he had inherited a well-defined and powerful tendency in one direction for the rendering of female dress. Alive to this tendency, he could further idealise from the costume of daily life. Again, he had few changes of fashion to disturb him in the sense in which we understand change of fashion. But from this it is not to be supposed that the ancient Greek ladies, though no doubt more kept at home than their modern sisters, were regardless of taste in their dress. The endless number of toilet scenes on the ancient vases shows that this was not the case, and accordingly we are obliged to conclude that the exercise of their taste was directed chiefly to the material and the folds of their dress, such as could be produced without any change in the simple hereditary fashion of a girdle and pins on the shoulders. That also was an advantage to the sculptor. It was the custom of people generally in his time to look to and appreciate those very features of dress which best suited his art. The dress usually worn was one which lent itself equally to any form of action—reclining, standing, kneeling, running—and it is not improbable that habits of freedom and suppleness of movement on the part of the wearers may have largely contributed to keep the form of dress unchanged.

Attempts have been made with many kinds of material to obtain a system of folds approaching to that which the Greek sculptor had before him. Indeed, there was some time ago a gathering of ladies wearing the Greek dress in almost every material possible. But it is only quite recently that pieces of really ancient dress have come to our knowledge. What we knew before from literary records and from figures on the painted vases or in sculpture, did no more than enable us to make conjectures as to which of the modern materials would be the best equivalent. We do not say that the new fragments will in any serious way effect the ideas of artists who have been accustomed to work out figures in classical costume. Their instincts have more or less led them in the right path. Yet it may be worth while to point out the actual character of these ancient pieces of Greek dress.

In the first place, they belong partly to the fifth and partly to the fourth century B.C.; they were found in tombs at Kertch, and they are reproduced in their colours and texture in the plates of the *Compte-rendu* of the Imperial Commission of Archaeology at St. Petersburg for the past year. An examination of them has shown that they are of a fine woollen fabric, woven very much as if they were of very fine linen. In the older and more skilfully executed pieces the threads were dyed before weaving and selected to form coloured stripes in the web. On the cloth thus produced a very rich and effective system of floral patterns was embroidered, fine wools of various colours being used. This embroidery was employed chiefly to form a heavy border round the skirt, and this it would do both in appearance and in fact. On the rest of the dress we may conclude that it was sparingly employed. The

more recent pieces—those of the fourth century B.C.—are not strictly parts of a dress. They are parts of a covering which had been laid over the sarcophagus of a warrior whose skeleton was found within it. But this covering compares so well with the representations of dresses which we occasionally see on the ancient vases, that we may deal with it as if it had really been an article of dress. It was woven in breadths which were sewed together to the required size. The material is a fine wool, but the texture is very open. The wool was undyed, and it was not till the several breadths had been sewed together that the process of decoration commenced. The whole surface is divided into parallel stripes of several inches broad, and on these stripes are painted a series of scenes from the Greek mythology and legend, the name of each figure being added in large bold letters, so that there might be no question of his identity. These designs are painted in a yellowish red colour, while the ground of the garment is of a dark brown. The whole effect is precisely the same as that of a contemporary Greek vase, except that the drawing, as may well be imagined, is very coarse. On the vases it is rarely so, whatever its other faults may be. The difficulty of painting these comparatively small designs on a woollen fabric of loose texture was one which we may suppose could not be easily overcome, or we should have had a better result, seeing that the work to all appearance had been executed in Athens, as indeed were the greater part of the vases, gold ornaments of the richest invention and workmanship, armour and other articles found in the tombs of the Crimea and now in the museum of St. Petersburg.

The resemblance between the decoration of these pieces of drapery and that of contemporary Greek vases is a resemblance which holds good also of the older pieces already described from a tomb of the fifth century B.C., and this is a circumstance which is of some value in archaeology, since it has long been argued that the origin of vase decoration was to be traced to an imitation of patterns evolved in the process of weaving with threads of different colours. But though it was obvious that the earliest vase patterns were such as might most readily have been arrived at in this way, and though the dresses sometimes figured on vases presented the same patterns as the vases themselves, there was yet wanting, until these pieces of actual dress were brought to light, positive proof of the connection between the two industries. The connection now established does not, it is true, go back to the period of the early vases of which we have been speaking; they cannot be later than the eighth century B.C. But it, at all events, gives a foundation from which we may reasonably argue back to that period, and it enables us, at the same time, to partly solve a difficulty which has arisen with regard to a large class of vases found in Cyprus. These vases are ornamented with geometric patterns, and as such would come under the category of those which were influenced by the oldest textile fabrics, from which, however, they differ in form and general appearance. As to vase painting, there is no reason why, if left to itself, it should not advance steadily from one stage of invention and skill to another, as it did in Greece, influencing in its turn the productions of the loom. The decoration of textile fabrics, on the other hand, is at all times liable to fall back on a system of patterns evolved in the process of weaving. Cyprus was, even in late times, a busy centre of textile industry, while in the production of vases it had never made any real progress. We can understand, then, the Cypriote vases in question to have derived their geometric system of decoration from the later textile industry of the island in its humbler productions, where only those forms of ornament were employed which could be most simply reached in the ordinary process of weaving.

The second stage of early Greek vase painting was characterised by parallel stripes painted with figures of animals, the ground of the vase all round these animals being filled in with rosettes. Here, again, an interesting comparison may be made with the ornamentation of Greek dress. The tombs of the Crimea have yielded several thousands of rosettes and other ornaments in thin gold which had been stitched on to dresses the material of which had disappeared from the effects of time. Similar rosettes of very thin gold were found in early tombs in the island of Rhodes. Often for the sake of cheapness the rosettes were made of glass, and were pierced with holes by which they could be sewed down to the dress. Of this latter class examples were found in the graves at Mycenæ, and in other localities of Greece, where the circumstances showed them to be of an early age, contemporary with or

perhaps earlier than the vases which are decorated profusely with painted rosettes.

Contemporary with the vases of the best period, when the human figure became the principal source of decoration, it is clear that the ornamentation of dresses followed in the same lines. We know this not only from the fragments found in the Crimea and from the pictures on vases, but also from the descriptions still existing of the dresses which it was the custom for ladies to dedicate to the goddess ARTEMIS at Athens. These descriptions sometimes read precisely as if they were drawn from a vase. On the dresses there was a much wider scope for colour, and far less for delicate drawing. To judge by the Crimean specimens, the sense of harmonious colouring was excellent. It was evidently a subject of special study, and we are not surprised when we find the names of men who had been distinguished in this artistic industry handed down among the artists of Greece.

### THE "PHRYNE AT ELEUSIS" OF SIR FREDERICK LEIGHTON.

IN a central place in the third gallery at Burlington House is a work by the President, and called *Phryne at Eleusis*. The pervading orange tint of the picture is remarkable—it is, indeed, at first surprising; it might be anywhere, but it is especially so when presented under circumstances of exaggerating contrast. But even when we recognise that the glow of the flesh tints is to be regarded as heightened by the peculiar illuminating sunlight, there still remains an expression of the exceptional colour which the ancients ascribed to the general complexion of PHRYNE. She was one of that class of *hetæra*—of feminine companions—who held at Athens an equivocal position: esteemed at once above and below the Attic matron. The jealous restriction of citizenship to purity of descent from both parents limited choice in marriage, and the established custom of extraordinary seclusion of the sex, even after marriage, was unfavourable to their powers of competing with the beauty, accomplishments, and often intellectual cultivation of adventuresses who shared the general advantage of Hellenic descent. One consequence of this seclusion was naturally visible in paleness of complexion: the Athenian in the "Ecclesiazusæ" of ARISTOPHANES takes his seat in the public assembly, and looks round in amazement at the white faces of the colleagues by whom he is surrounded, but who are in fact the wives who have disguised themselves in their husbands' cloaks, to get their own way for once in a vote for woman's rights. Such complexions account for what we read of the very usual employment of paint; but it is particularly recorded of PHRYNE that so radiant in natural freshness was the brightness of her skin that she dispensed with cosmetics entirely. (Galen, "Protrep." c. 11.) [It is not unfair to suppose that this was the suggestion to the painter for the peculiar and peculiarly effective treatment of this imposing study of the nude. But would it not have been fairer to his admirers, who are not limited to those who are familiar with the byways of ancient literature, and also to himself, if the catalogue had been allowed to supply some further information. Indeed, this instance prompts the inquiry, What is the principle upon which the catalogue is edited in respect of illustrations and quotations? The rarity of such insertions seems to imply that they are at least discouraged, and yet the few that appear do not always seem indispensable, while in other cases help would be welcome and be justified. In the case of this very picture the title has not saved a certain number of critics from desperate attempts to connect it with the most familiar incident in the history of PHRYNE, how the display of her unveiled beauty in open court melted the hearts of the dicasts—the Athenian people in their function of jurymen and judges—and gained her an acquittal.

True it is that on this theory the artist had to be excused for very arbitrary treatment of the story, for, as it runs, it was her advocate HYPERIDES, who, seeing that as his speech went on he made no impression, and that the cause was as good as lost, suddenly tore open her dress and exposed the beauty of her bosom, which was known by report to be most exquisite, and appealed with success to the people to spare the very servant, the priestess of APHRODITE. But still the charge by which PHRYNE was brought in peril of her life was not immorality, which the Athenians would not have recognised in her case and position, but that deadlier and more venomous imputation

of impiety which had once imperilled ASPASIA; and that such a charge should have had reference to Eleusis, the seat of the most mysterious and venerated worship of the Athenians, is likely enough, and might not unnaturally have been assumed. What misapprehension there is here—misapprehension which interferes so seriously with the intention—and contradicts the entire sentiment of the picture might have been spared to us by a line or two of discreet and indulgent words in the catalogue. The proper story is that PHRYNE, on an occasion when the Greeks were assembled in solemn festival, gratified them by a display of the beauty which inspired the art and had exhausted the purse of PRAXITELES: with loosened tresses she went down into the sea, and returned as the Emergent Venus, *Aphrodite Anadyomene*.

As we are arguing in favour of exactness, we must demur to the brief title, *Phryne at Eleusis*. The incident does not belong to that locality, though the fact would scarcely need observation but for the interest that attaches to the general anecdote. ATHENÆUS had authority for relating that on two great festivals, the Eleusinian and that of POSEIDON, PHRYNE repeated this exhibition in view of the collected Greeks, and so became the model to APOLLO for his painting of *Aphrodite Rising from the Sea*, and to PRAXITELES for the statue of the goddess which he executed for Cnidus.

What was the particular festival of POSEIDON, the God of the Sea, does not appear; as regards the other, on the second of the days devoted to the great Eleusinian celebration, and of which the title was "Seaward, ye Mystics"—that is, "ye initiated, or aspirants to initiation"—there was a general movement to the port, and the sea-water was credited with efficacious preliminary purification. Put off her dress and drapery as she might, there is some appearance that PHRYNE in "letting down" her hair was not moved merely to display its abundance, but was aware that she thus regained some of the advantage of a veil, which enhances even when it threatens to disappoint admiration. Indeed, if we were disposed to cavil at the design of the picture at all, we might express a wish that the hair had not only received somewhat more distinctive expression, but had been allowed to flow down in entirely unstinted luxuriance.

Close to the Piræic port, the scene of this incident, was a temple of APHRODITE; it was a dedication of CONON after his naval victory off Cnidus, and to the favourite goddess of that city—the goddess born of the sea and honoured under the title EUPLOIA, as patroness of the seafaring and promoter of favourable voyaging. PHRYNE thus in her exploit might seem to be adventurously personifying the goddess in her proper locality and at the very suggestion of her lover PRAXITELES, who was at the time employing her as the model for the statue which he executed in marble for the citizens of Cnidus—that statue of which the *Medicean Venus* is supposed to be one of the numerous emulative variations. Having broken into conjecture so far, another step is unavoidable. It is to be feared, from what we know too well of the Athenians, that we should be doing no injustice to them if we think it possible that after enthusiastically cheering this exhibition at the time, they very soon afterwards could favourably listen to an accuser who founded on it a capital charge of impiety towards the gods. The spirit in which such a charge might be preferred and might be dangerously entertained is not different from that which we trace in every line of the examination of TINTORETTO by the Inquisition, and which raised an outcry of heresy against BOTTICELLI on the occasion of the first exhibition of the grand composition which Mr. BURTON has just obtained for the National Gallery. Let us hope that these invidious attacks were in no case due to jealous suggestions of rival artists.

**Stained Glass.**—A stained-glass window, which is about to be sent to New Zealand for the music warehouse of Messrs. Milner & Thompson, of Christchurch, New Zealand, has been on view in the showrooms of Messrs. Heaton, Butler & Baynes, of Garrick Street, Covent Garden, London, W.C., who have designed and executed the work. The window consists of a large circular-headed centre panel and two side panels. In the centre are two figures representing the lyric muse Euterpe and the god Apollo with the golden lyre. In the upper portion of the same window are medallions supported by cupids, holding a scroll with the legend "From heavenly harmony this universal frame began." The names of eminent musicians are introduced into the side windows. This glass is of special interest, inasmuch as it is the first specimen of real high-class work that has been sent to this colony. The window will be exported by Messrs. Cohn & Co., of London Wall, E.C.

## THE PRESCRIPTION ACT IN RELATION TO LIGHT AND AIR.\*

IT is obvious that it would in most cases be possible to give positive evidence of user or enjoyment of light, air, or other thing for many years preceding the trial of an action, but for prescription it was necessary to prove it for "time whereof the memory of man runneth not to the contrary," as the legal phrase runs; and this was held to mean not merely the memory of living persons but for a period extending back to the time of Richard I. It therefore became the practice on proof of enjoyment for a limited time, generally twenty years, to allow a presumption that the user had continued for "time whereof the memory of man runneth not to the contrary," unless evidence were given to rebut that presumption. It was from this practice that the period of twenty years became the prescriptive period, but that exact time does not seem to have been absolutely fixed till the early part of this century. I find a case of "Cotterill v. Griffiths" tried in the year 1801, in which it was urged by counsel that a window could not be said to be "ancient" so as to confer a right to light which had existed for thirty years, but Lord Kenyon, the judge, held that that was sufficient, and said that Chief Justice Wilmot had held that if windows were open for twenty years, *or perhaps even less*, that gave the owner of the house such a right that they could not be obstructed, and he added that that had been since considered as the law on the subject. About the same time (1803) user of a way for twenty years was held to raise a presumption of a grant of a right of way by a deed which had been lost, although it was shown that twenty-six years before all ways over the land had been extinguished by Act of Parliament. This user though capable of raising a presumption of a grant by a lost deed was incapable of establishing a prescriptive right, as the Act of Parliament was evidence that the user could not have continued from time whereof the memory of man runneth not to the contrary.

At a later period (1824) Justice Bayley said: "I do not say that twenty years' possession confers a legal right, but uninterrupted possession for twenty years raises a presumption of right, and ever since the decision of "Darwin v. Upton" it has been held that in the absence of any evidence to rebut that presumption, a jury should be directed to act upon it."

It is right to add that a grant could only be presumed, and a prescriptive title established, if the person against whom the presumption was to be raised knew of the user, and was in a position to stop it and did not do so. And this was the same whether the right claimed was a right to light, air, or anything else. It will, however, be seen presently that this is a point in which a great change was effected by the Prescription Act with respect to light, for now a right may be acquired to uninterrupted light, although the owner of the servient tenement may have been out of possession and incapable of obstructing the light during the whole prescriptive period, the tenement being in the occupation of a tenant, or although he may have been quite unconscious, through absence, that his neighbour had opened a new window overlooking his land.

After the commencement of the present century cases relating to prescription and the law of easements became much more numerous, the reports became fuller and more accurate, and the law became more settled and defined. At the same time people began to see the shortcomings of the law and the absurdities which had crept in, and among other absurdities which attracted attention was the fiction of the lost grant which everybody knew full well never really existed, and the presumption of what was called "ancient user," on evidence being given of user for twenty years. At the same time that these legal cobwebs had been collecting, others equally absurd had been woven with reference to fines and recoveries, tithes, and other matters relating to land, which were utterly unintelligible to the mass of mankind, and perplexing to those who understood them. It was thereupon decided by King George IV., in the year 1829, to issue a Royal Commission for an inquiry into the whole subject of real property, and Lord Campbell was appointed Chairman of the Commission. This Commission made a searching and exhaustive inquiry into all the branches of the subject submitted to it, and published three elaborate reports. From these reports arose some of the greatest reforms in the law of real property the country has known. We have nothing to do with the principal alterations in the law which derived their origin from this source, but the first Act which sprang from the labours of this Commission was the Prescription Act (2 & 3 William IV., c. 71). The procedure adopted by the Commission to gain information as to grievances and suggestions for the amendment of the law, was to issue a set of questions to a number of persons inviting answers and suggestions. Three or four of these questions had reference to the law of prescription and easements, but none especially related to light or air. As the inquiry of this Commission led to such important results, I think it only fitting in this paper to set out fully that part of the Com-

missioners' report which had reference to the subject now under consideration.

The Commissioners dealt with the limitation of actions and the law of prescription together, and at the outset of that part of their report, when speaking of both, say, "It might at first sight be considered that the duration of wrong ought not to give it a sanction, and that the long-suffering of injury should be no bar to the obtaining of right when demanded. But human affairs must be conducted on other principles. It is found to be of the greatest importance to promote peace by affixing a period to the right of disturbing possession." Afterwards they treat of the law relating to prescriptive rights to profits *à prendre* and easements alone, and say: "The law relative to prescriptive rights to profits and easements to be taken or enjoyed over the soil of another appears to us to require amendment. This right can only be established by what is deemed legal proof of an adverse enjoyment of 640 years. By the ancient rule of the common law enjoyment of such a right was to be proved from time whereof the memory of man runneth not to the contrary, or during legal memory. Had this meant as far back before the dispute arose as could be proved by living witnesses according to the usual duration of human life, the rule would not have been unreasonable, but the limits of legal memory were formerly fluctuating. They were long made to depend upon the period for bringing a writ of right, which till 32 Henry VIII. was not any certain period before the commencement of the suit, but dated from some historical event from time to time—as the beginning of the reign of Henry I., the return of King John out of Ireland, the journey of King Henry III. into Normandy, or the coronation of King Richard I. The last epoch being fixed by the statute of Westminster 2nd, c. 46, as the time after which seisin must be proved to maintain a writ of right, it was thence adopted as the commencement of legal memory. When 32 Henry VIII. provided that there should be a progressive period for writs of right, legal memory ought, preserving the existing analogy, to be considered as intending a period of sixty years next before the dispute arose, but unfortunately the analogy to writs of right was dropped, and the reign of King Richard I. was adhered to, and is considered the commencement of legal memory at the present day. The practice of the Courts has created a remedy to this inconvenient and absurd rule in ordinary cases; for on proof of enjoyment as far back as living witnesses can speak raises a presumption of an enjoyment from the remote era. In some cases, however, the practical remedy fails, and the rule produces most serious mischiefs. A right claimed by prescription is always disproved by showing that it did not or could not exist at any one point of time since the commencement of legal memory, or although it originated before the commencement of legal memory, that at some subsequent period the servient tenement, or that over which the right is exercised and the dominant tenement, or that to which the right is attached once belonged to the same individual, whereby the prescriptive right was extinguished. Amidst these difficulties it has been used of late for the purpose of supporting a right which has been long enjoyed, but which can be shown to have originated within the time of legal memory, or to have been at one time extinguished by unity of possession to resort to the clumsy fiction of a lost grant which is pleaded to have been made by some person seized in fee of the servient tenement to another seized in fee of the dominant tenement."

It is unnecessary for our present purpose to quote the next part of the Commissioners' report. They go on to explain the falsity of this presumption of the lost grant, which, though gravely proposed by counsel, sanctioned by the judge, and accepted by the jury, was well known to counsel, judge, and jury to have no foundation in fact. The Commissioners then recommended that adverse enjoyment of a profit *à prendre* or easement for sixty years before any action in or over the soil of another person should for the future be deemed conclusive evidence of a right to such profit or easement. But as to this period the Commissioners proposed a further modification of what they had suggested, and said, "But we are also of opinion that with respect both to profits and easements a shorter period, viz., twenty years, should also be established as affording presumptive evidence of right, liable to be rebutted by proof that during that time the servient tenement was occupied under a lease, or was held by a tenant for life, or by a person under disability."

With respect to the presumption of a grant of a right claimed which was always necessary, as I have already explained, to support prescription, the Commissioners say, "But we think the necessity of alleging the grant of an easement in pleading might in all cases be dispensed with. The right to an easement, generally speaking, is in truth acquired, not by any deed, but by the acquiescence for a given time of a party competent to interrupt the exercise of the right; and this is now in substance considered equivalent to a grant, though no grant be executed." This recommendation, it will be observed, only relates to the mode of pleading a claim to a prescriptive right; it does not affect the actual law, and as a matter of fact after the Prescription Act was passed it still remained as necessary to show the circumstances from which a grant might be presumed as it was before, except in those cases in which the Act declared the right to be "absolute and indefeasible."

It might have been supposed that after this inquiry and

\* From a Report by Mr. J. Leybourn Goddard, prepared by request of the Light and Air Committee of the Royal Institute of British Architects.

elaborate report the Government of the day would have acted upon it, and brought in Bills to carry the recommendations of the Commissioners into effect, but such does not appear to have been the case. The pages to which we naturally turn to see what was done in Parliament are those of Hansard, and there I find but a very scanty report of what took place, but certainly the Government took no steps in the matter. The great question of Reform was at the time occupying the attention of the Legislature and disturbing the mind of the country, and that may have been the reason why the Government did not take the subject up; but be it what it may, all the real property subjects seem to have fallen into the laps of the Lord Chief Justice of the King's Bench, Lord Tenterden, and Mr. Campbell; and we find the former as the introducer of the Prescription Bill in the House of Lords. At its introduction the Bill was not confined to profits *à prendre* and easements, as the Act was subsequently, but it contained also provisions relative to tithes and other matters. These provisions gave rise to some petitions and debates in Parliament, and they were ultimately separated from the rest of the Bill and became a distinct Act (2 & 3 William IV., c. 100). I do not find in Hansard that there was any debate whatever respecting the easement clauses of the Bill, nor that there was any petition respecting them. The only reported speeches about them appear to have been those made on the occasion of the first introduction of the Bill (for it was introduced three times) on March 15, 1831. Lord Tenterden then explained that the Bill was divided into parts, the first relating to profits, as rights of common, for which he proposed a period of sixty years for an indefeasible title, and thirty for a presumptive title; the second relating to easements, for which he proposed the periods of forty and twenty years; the third part relating to lights, for which he proposed the period of twenty years only; the fourth part relating to tithes; and the fifth to terms of years in conveyances. He said he had availed himself of the suggestions of the late Real Property Law Commission, when he thought them suitable for his purpose, and the Lord Chancellor expressed his great admiration at the able and luminous manner in which Lord Tenterden had brought the matter forward, and he spoke of the importance of the subjects.

It will be observed that Lord Tenterden made a difference between the easement of light and other easements. He did not explain the reason for the difference, and I do not find that the Royal Commissioners suggested that any difference should be made. The difference must have originated with Lord Tenterden, and he is reported to have said on the subject that "the third part relates to ancient lights and their obstruction. As to these also judges were often obliged to leave it to juries to presume that they were ancient lights. It was in his opinion preferable to fix the period of twenty years by law, for which period, if uninterruptedly enjoyed, they were to be secure from challenge, unless originally enjoyed by contract or agreement." He is not reported to have said anything about the ancient customs which the Act swept away, and the Bill seems ultimately to have passed through Parliament without any discussion or objection whatever, except on the subject of tithes. The Bill was brought in the first time on March 15, 1831, but the Parliament was dissolved before much progress had been made. It was re-introduced by Lord Tenterden on August 19, 1831, and reached the stage of Committee on September 22, and was then ordered to be reported; but Parliament being prorogued on October 20, the Bill seems to have progressed no further. It was introduced again in the Lords by Lord Tenterden on March 30, 1832, and became law on August 1 of that year, without, as far as I am aware, any discussion or amendment, except with reference to tithes and the terms of years in conveyancing which do not appear in the Act.

I can only suggest one reason why that remarkable difference, which is so considerable and of such importance, should have been made between rights to light and rights "to any way or other easement, or to any watercourse or the use of water," as the 2nd section of the Act has it. I explained that the law of prescription in theory depended upon the possibility of presuming a grant, but that in the case of light and air to a window it is not strictly speaking possible to presume a grant, as no grant is required to entitle a man to make a window in his own house, or to give him a right to the light and air which naturally will enter it. To defeat a claim to a right of way or water after twenty, but before forty years' user, it is still sufficient to show that no grant of the right could have been made. The words of the Act with regard to them are, that after twenty years' user they "shall not be defeated or destroyed by showing only that such way or other matter was first enjoyed at any time prior to such period of twenty years, but nevertheless such claim may be defeated in any other way by which the same is now liable to be defeated," which includes the showing of an impossibility of a grant having been made. This provision clearly could not be applied to light and air for which no grant is required, and for this cause I think it probable that the distinction was made by Lord Tenterden which places prescription to light after twenty years' enjoyment on the same footing as a prescription to ways and watercourses after user for forty years, and makes the right absolute and indefeasible.

I have now traced the history of the easements of light and air up to the time when that important Act which made such an altera-

tion in the law was passed, and the only part of my task that remains is to show the effect of the Act as it is illustrated by the subsequent decision of the courts. To comment upon all these decisions would be to write a book, and beyond the scope of this paper, but there are some in which leading principles have been discussed which therefore demand some attention.

The first thing to be noticed is that the third section of the Prescription Act mentions light only, and says nothing about rights to uninterrupted currents of air. Whether this was an oversight or not I am unable to say, but I am inclined to think that it was. It has been a question whether a right to air was not included in the expression "other easement" in the second section, but in the case of *Webb v. Bird*, which was a claim of right to wind for a windmill, it was decided that it was not, "for," said the judge, "it appears to me that this section was not intended to give a right after twenty years to every sort of enjoyment which may be classed under the general term easement, but that it was meant to apply only to the two descriptions of easement therein specified—viz., the right to a way or watercourse which may be enjoyed or derived 'upon, over, or from any land or water.' I do not think the passage 'of air over the land of another' was or could have been contemplated by the Legislature when forming that section." And in another place he adds, "The Legislature evidently considered the passage of light" (which, said the Master of the Rolls, in *Sturges v. Bridgman*, bears a very close analogy to that of air) "to stand upon a different footing from the other easements with which it had been dealing in the preceding section, and if it had intended to extend the right to the uninterrupted passage of wind and air it would have done so in express terms." It will be seen, therefore, that the law relating to light and that relating to air now stand upon an entirely different footing, though, as I remarked at the commencement of this paper, we commonly find in practice the two coupled together when a window is obstructed, as if the law was the same for both. It should, however, be added that, though the Prescription Act does not touch the subject of air, and though no right can be acquired at common law to have the air passing over an open space unobstructed, yet that a prescriptive right at common law to have the air accustomed to enter a window unobstructed has been recognised as law ever since the time of *Aldred's case*, in the reign of James I. Nevertheless, though an injunction may now be obtained without difficulty to stop the obstruction of light, it would require a strong case to induce the Court to restrain interference with a current of air to a window, unless the obstruction also hindered the access of light. Lord Selborne, as Chancellor, said that he has observed that in all class of cases a formula had crept into the pleadings, and from the pleadings had passed into evidence as to air as well as to light; but that the nature of the case which would have to be made for an injunction by reason of the obstruction of air was *toto calo* different from a case of light. Cases, he added, are very rare indeed, and must be very special, such as to involve danger to health, or something very nearly approaching to that, to justify the interference of the Court on the ground of the diminution of air.

I have already made some remarks upon the difference which was made in the Prescription Act between rights to ways and water and rights to light. Before leaving the subject altogether I think I ought to call more particular attention to the exact words of the sections relating to those rights respectively, and to the peculiar effect of the third section, as it was explained in a judgment of the late Lord Westbury in the House of Lords. That judgment is also worthy of attention, because the learned lord so clearly explained the nature of a right to light, and a popular error respecting it. The second section of the Act states that no claim which may be lawfully made at common law by custom, prescription, or grant to any way or other easement (which has been held to mean only any other easement in the nature of a way or right to water, though this limitation has recently been condemned by the Lord Chancellor in the great case of *Angus v. Dalton*, which relates to support for buildings), or to any watercourse, or the use of any water, when such way or other matter shall have been actually enjoyed by any person claiming right thereto without interruption for the full period of twenty years shall be defeated or destroyed by showing only that such way or other matter was first enjoyed at any time prior to such period of twenty years, but nevertheless such claim may be defeated in any other way by which the same is now liable to be defeated; and where such way or other matter shall have been so enjoyed as aforesaid for the full period of forty years, the right thereto shall be deemed absolute and indefeasible, unless it shall appear that the same was enjoyed by some consent or agreement expressly given or made for that purpose by deed or writing. The third section, which relates exclusively to light, says that when the access and use of light to and for any dwelling-house, workshop, or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding, unless it shall appear that the same was enjoyed by some consent or agreement expressly made or given for that purpose by deed or writing.

I have already called attention to the fact that the Act places a claim to light after twenty years' enjoyment on the same footing as

a claim to a way or a right to water after forty years; this will be seen more clearly now that I have given the language of the sections. I have also explained the only reason which I can imagine for the difference, so that I have need to say nothing more on that point in this place. I therefore pass on to the important case of *Tapling v. Jones*, in which Lord Westbury, who was Chancellor, explained the nature of the easement of light since the Act, and the principles of law which now govern it. After reading the third section of the Act his lordship said that "it is material to observe, with reference to the present appeal, that the right to what is called 'an ancient light' now depends upon positive enactment. It is matter *juris positivi*, and does not require, and therefore ought not to be vested on any presumption of grant or fiction of a licence having been obtained from the adjoining proprietor. Written consent or agreement may be used for the purpose of accounting for the enjoyment of the servitude, and thereby preventing the title which would otherwise arise from uninterrupted user or possession during the requisite period. This observation is material, because I think it will be found that error in some decided cases has arisen from the fact of the courts treating the right as originating in a presumed grant or license. It must also be observed that after an enjoyment of an access of light for twenty years without interruption the right is declared by the statute to be absolute and indefeasible; and it would seem, therefore, that it cannot be lost or defeated by a subsequent temporary intermission of enjoyment, not amounting to abandonment. Moreover, this absolute and indefeasible right, which is the creation of the statute, is not subjected to any condition or qualification, nor is it made liable to be affected or prejudiced by any attempt to extend the access or use of light beyond that which, having been enjoyed uninterruptedly during the required period, is declared to be not liable to be defeated. Before dealing with the present appeal, it may be useful to point out some expressions which are found in the decided cases, and which seem to have a tendency to mislead. One of these expressions is the phrase "right to obstruct. If my adjoining neighbour builds upon his land, and opens numerous windows which look over my gardens or my pleasure-grounds, I do not acquire from this act of my neighbour any new or other right than I before possessed. I have simply the same right that I before possessed. I have simply the same right of building or raising any erection I please on my own land, unless the right has been by some antecedent matter either lost or impaired, and I gain no new or enlarged right by the act of my neighbour. Again, there is another form of words which is often found in the cases on this subject, namely, the phrase "invasion of privacy by opening windows." That is not treated by the law as a wrong for which any remedy is given. "If A be the owner of beautiful gardens and pleasure-grounds, and B is the owner of an adjoining piece of land, B may build upon it a manufactory with a hundred windows overlooking the pleasure-grounds, and A has neither more nor less than the right which he previously had of erecting on his land a building of such height and extent as will shut up the windows of the newly-erected manufactory." The learned lord then proceeded to apply these principles to the case before the House, which related to the effect on ancient lights of opening new windows and increasing the size of the old ones, which is beside the purpose of this paper.

The only other point to notice with regard to the third section of the Act is the power of acquiring right to light, "any local usage or custom to the contrary notwithstanding." This provision had the effect of abolishing an ancient custom in the cities of London and York, and possibly in some other towns, whereby any person possessed of an ancient foundation was at liberty to rebuild on that foundation to any height, notwithstanding that the effect of raising the height of the building above the old level was to obstruct the light accustomed to enter a neighbour's ancient window. The custom is mentioned in several old cases, as *Aldred's case*, *Hughes v. Keene*, *Ryder v. Bentham*, and *Wynstanley v. Lee*; but I do not find it referred to in the report of the Real Property Commissioners, nor in Hansard's report of the proceedings in Parliament. It was held that the Act had abolished the custom in the cases of the *Salters' Company v. Jay*, and *Truscott v. Merchant Taylors' Company*.

**Carlisle.**—The Carlisle and Cumberland Banking Company, Limited, are making extensive alterations to the bank premises in Devonshire Street, which were formerly occupied by Messrs. Mackie, Davidson & Mackie. The ground floor is being transformed into shops and the upper floors into offices, with accommodation for caretaker, &c. The contractor for the whole of the works is Mr. Thomas Milburn of Carlisle, and the architect is Mr. George Dale Oliver, of Carlisle and Workington.—The Drill Hall of the 1st Cumberland Rifle Volunteers is to have a new roof, owing to the old wooden one being in a dangerous condition. Mr. George Dale Oliver, architect, of Carlisle and Workington, has been appointed to replace it, and he has decided to substitute one of iron which, with an increased height of walls and other minor improvements, will greatly add to its stability and appearance. The tender of Messrs. Pratchitt Bros. has been accepted for the ironwork, and that of Messrs. Davidson for the rest of the works.

## THE CASTLE OF PHAROS.

ONE of the buildings destroyed at Alexandria was the castle of the Pharos, which was practically the only specimen of Arab mediæval architecture in the city. It stood on the site of the celebrated lighthouse, by the ancient name of which it was still commonly known. Mr. H. C. Kay says that being at Alexandria in the spring of last year, he desired to visit the building, and was fortunate enough to obtain a permission to do so, which for a long time past has been rarely granted. His object, apart from motives of interest in the old building itself, was to ascertain, if possible, whether any signs could be discerned of its having been erected on the actual foundations of its more ancient and renowned predecessor. Mr. Kay's inspection was necessarily a very superficial one, but as far as it could go it confirmed him in the belief that some such indications are actually to be detected, and he noticed in particular a spot, near one of the corners of the building, where the wall could be perceived to run in a direction not widely but distinctly different from that of the presumably original foundation, with which it formed a gradually divergent angle. The Pharos was still in existence in A.D. 1326. It became a complete ruin between that date and A.D. 1349. The present building was erected by the Egyptian Sultan Kait-Bay, who reigned from A.D. 1468 to 1496. It may readily be presumed that, according to the uniform practice of the East, the ground continued until that time encumbered with the ruins of its predecessor. The name and titles of Kait-Bay were imperfectly but unmistakably legible on one of two much-decayed limestone tablets over the entrance gate. The latter was roughly formed by three massive blocks of granite, two of which, standing erect, served as jambs on either side, with the third forming a lintel across the top, the whole presenting a peculiarly Egyptian appearance. A wide passage, turning at an abrupt right angle to the left, gave access to a small mosque, consisting of a hypæthral court, with four arched recesses, one of which contained the kiblah and pulpit. The slight deviation of the walls of the castle from the lines of the ancient foundations may possibly have been made for the express purpose of placing the mosque in the true line of direction towards Mecca.

The mosque composed but a very small portion of the building. The remainder, rising one storey above the other, was occupied by innumerable rooms of various sizes, opening out of long and narrow passages, all empty and for many years apparently disused. Mr. Kay was informed that it was capable of lodging 5,000 men—a statement which was probably not exaggerated. The quarters intended for the commander and other superior officers were easily distinguishable by their superior look, and by some scanty remains of decoration and of ancient mosaic flooring of coloured marbles.

On the flat roof rose a somewhat ruinous minaret, the upper portion of which had disappeared, but which contributed much to the picturesqueness of the massive square building, which, with its rounded towers at each of its four angles, formed so conspicuous a feature in the view of Alexandria, on its eastern side, both from the land and from the sea.

It is, of course, highly improbable that the castle will be rebuilt. We must, on the contrary, expected that its shattered fragments will speedily be removed. But it is to be desired that this may not be done without the presence of some competent person, able to ascertain, with some degree of precision, whether anything be really still in existence of the last remains of the widely-celebrated monument that once stood upon the spot.

## PROTECTION OF ANCIENT MONUMENTS.

THE President of the Devonshire Association in the course of his address called attention to this subject. He said: In February, 1869 the Office of Works requested the Society of Antiquaries to furnish "a list of such regal and other historical tombs or monuments existing in cathedrals, churches, and other public places and buildings, as in their opinion it would be desirable to place under the protection and supervision of the Government, with a view to their proper custody and preservation." A committee was appointed by the Society, and three years after this committee made a report, which in June 1872 was published as a Blue Book. Out of all the historical tombs in this county, the committee thought proper to recommend the proper custody and preservation of seventeen only. With the issue of the Blue Book the matter ended, and we have heard nothing of Government preservation of regal and historical tombs since. But it is a matter that deserves serious attention, and I would suggest that at the visitations of bishops, archdeacons, and rural deacons enquiry should be made, not only as to the state of the vestments, books, and church plate, but also as to the state and condition of the monuments and tablets in the various churches, and that those officials should receive suggestions for the better care and preservation of such silent witnesses to the commemorated dead. In the same year (1869) a really successful effort was made. A Royal Commission was issued, the result of which has been the publication of the eight volumes of Reports of the Historical Manuscripts Commission. Owners of documents readily placed their stores at

the disposal of the officers of the Commissioners for examination, and the result has been to open up a mine of literary wealth to the historical student. We have in Devonshire a place which has long been one of interest. It is true that Dartmoor has no circle to compare with Stonehenge, or anything to rival the alignments of Carnac; but it has within a small area ancient remains of the greatest value, and barrows, circles with avenues, dolmens and menhirs, are very accessible, and can be examined under conditions more favourable for study than in perhaps any other locality. Any attempt, therefore, to preserve these must excite our warmest approval. Perhaps no class of ancient remains are so exposed to destruction as the rude stone monuments, the camps, dykes, and earthworks of the early inhabitants of this country. Some of these have, from their size and remoteness from the haunts of men, been preserved so far; but every day, as the encroachments of the agriculturist and the builder become more bold, these are, if not actually destroyed—as, unfortunately, has been the case in many instances—seriously threatened. The preservation of these has been an anxious care on the part of many antiquaries; but all that they were able to do was to endeavour to create a wholesome public feeling in their behalf. But something more than this was required. Legislative powers were necessary in order to deal with the safety of these valuable remains in a proper way, and therefore, when Sir John Lubbock announced his intention of bringing before Parliament a Bill having for its object the preservation and care of ancient monuments, all antiquaries hailed the news with delight. So far, however (and Mr. Rowe traced the history of the efforts made to pass the Bill through Parliament), no success had been attained. In spite of the efforts of those who know the value of these monuments best, they are left without care, exposed to the ravages of the spoiler and the caprice of the Philistine. We have an interest, second perhaps to those living in no other locality, in the passing of such a measure as that to which I have been referring. It is much to be desired that no time should be lost in endeavouring at all events to preserve what few remains are still left to us; for it cannot be doubted but that those that remain bear but a very small proportion to those that are altogether lost. It seems to me that these things stand on a very different footing from any other remains of antiquity. While books, monuments and manuscripts for various reasons have their friends interested in their preservation, these prehistoric monuments have but few, and the supposed exigencies of agriculture, or the necessities of the farmer, joined to the remoteness of the localities in which they are for the most part situated, present opportunities for interfering with them.

#### ARCHITECTS AND QUANTITIES.

A LETTER from Mr. R. M. Phipson, F.S.A., appears in the *Norwich Mercury*, in which he says:—It is perfectly clear to the mind of every right-thinking man that the architect of the Norwich School Board has done nothing but what he was properly and fairly entitled to do under his agreement with the Board, and that his actions from the first have been most straightforward and aboveboard. No one who knows him could ever have supposed differently. But I must object to its going forth that it is the “invariable rule in the provinces for architects to supply builders,” and “that no builder would contract unless he were supplied by the architect with the quantities.” I know of several professional men who do nothing of the kind, and I can say for myself that during the thirty-four years that I have been in practice I have never on any occasion supplied builders with quantities. Yet I have never failed to get plenty of competition for all my works.

The insinuation that “surveyors who get out quantities make an allowance to the architect by private arrangement” is unworthy of Mr. Brown, and is, in my opinion, utterly contrary to fact. At any rate, I have never been offered it, and if such a proposal had been made, the surveyor would have left my office rather more quickly than he entered it. In the case of the Norwich City Asylum the surveyors charged 1½ per cent. for their work, and this was paid to them direct by the Corporation, who agreed to it, by their committee, beforehand. Apart from the fact that a money payment to an architect from a builder employed under him being in itself objectionable, there are other and far more cogent reasons why architects should not supply builders with quantities. Into these reasons this is not the proper place to enter. I will simply observe that it is the sole duty of an architect to his employer to see that his plans and specifications are carried out in their integrity, and when he steps beyond this he is running the risk of placing himself in a false position. The Royal Institute of British Architects, to which I have belonged since 1850 (and have had the honour of serving on the Council of that body), state in their printed instructions regulating professional practice and charges, “It is not desirable that an architect should supply to builders quantities, but in case of such being done it should be with the concurrence of the employer, and the architect should be paid by him, and not by the builder.” The Norwich School Board would appear to me by their arrangements “to spare at the spigot and let out at the bung-hole.”

#### DR. JAMES FERGUSSON, LL.D.

ON Tuesday last the degree of LL.D. was conferred by the University of Edinburgh on Mr. James Fergusson, the author of many books on architecture. In presenting Mr. Fergusson the Dean of the Faculty of Law said:—I have the honour to present to you, my Lord Chancellor, for the degree of Doctor of Laws, Mr. James Fergusson, Doctor of Civil Law, and Fellow of the Royal Society, the distinguished historian of architecture, whom the Senatus Academicus of the University of Edinburgh have deemed eminently worthy of this distinction. Born at Ayr, and partly educated in the High School of Edinburgh and partly in England, Mr. Fergusson afterwards went to India, and was there engaged in mercantile pursuits. But after a few years he abandoned these for the more congenial study of art and architecture. Not only among architects, civil and military, but among all lovers of art—and, indeed, among all persons of culture where the English language is spoken—Mr. Fergusson's name is a household word. In the year 1845, and several previous years, he travelled very extensively in India, and in many other countries, for the purpose of studying various styles of architecture. The results of those studies and unwearied researches have been very numerous and very valuable. First upon the list, I may mention Mr. Fergusson's very distinguished work upon “The Rock-cut Temples of India,” the standard work on the subject, published in 1845, and illustrated by himself. Mr. Fergusson being a distinguished draughtsman as well as a most accurate observer, next published in the same field of Indian architecture a valuable work entitled “Picturesque Illustrations of Ancient Architecture in Hindostan.” Under this head of Indian architecture must also be mentioned a very magnificent work entitled “On Tree and Serpent Worship,” being illustrations from the famous Buddhist worship in India, published at the expense of the Indian Government in 1868. To a second category belong Mr. Fergusson's studies in the field of Jewish architecture. In 1847 and in 1865 Mr. Fergusson published two works of great value and interest upon the topography of Jerusalem and upon the site and dimensions of the ancient temple of the Tabernacle; and in 1878, in the same category, he published a valuable work on Jewish temples. Then there is a third category, which also must be mentioned. Mr. Fergusson has thrown very much, and a useful, light upon the subject of Assyrian and Persian architecture. His work upon the ancient palaces of Nineveh and Persepolis is famous. It was published in 1851, and I may mention that he was subsequently appointed architect of the well-known and beautiful Nineveh Court in the Crystal Palace of Sydenham. To a fourth category belongs the standard work on Greek architecture—namely, the account of the mausoleum of Halicarnassus, published by Mr. Fergusson in 1855, being an account of the far-famed tomb of King Mausolus of Caria. In the fifth place, Mr. Fergusson's distinguished architectural researches may be said to have culminated in several works in the field of comparative architecture. The first of this series was his well-known “Handbook of Architecture,” published in 1858, which was followed in 1862 by “A History of Modern Architecture.” These two works were afterwards amalgamated and re-issued in the form of “A History of Architecture in all Times and in all Countries”—a magnificent work, the standard work on the subject, with which we are all familiar, which was re-edited so recently as 1875. There is also a sixth category which must be mentioned. Mr. Fergusson is also one of the foremost authorities of the age on the very interesting and important subject of military architecture or military engineering. So far back as 1849 Mr. Fergusson published a most valuable essay upon the then entirely new system of fortifications or defences by means of earthworks, a system which was afterwards adopted by the Russians at Sebastopol, by the Americans during their civil war, and subsequently, I think I may say, by all the great military nations of the world. In connection with his great distinction in this province Mr. Fergusson has, since 1859, acted as one of the Commissioners appointed by her Majesty the Queen to superintend our national coast defences. Lastly, but perhaps not least, must be mentioned Mr. Fergusson's distinguished labours as a natural philosopher. Within the last few years Mr. Fergusson has published a most valuable work upon the descent and oscillations of rivers, of which I need only say that it is a standard work upon this subject. Among many other distinctions I must mention the gold medal with which Mr. Fergusson was presented in 1871 at a great meeting of the Institute of British Architects, presented to him, with the approval of her Majesty the Queen, as being the foremost living British authority upon the subject of architecture. On these grounds I ask your lordship to confer upon Mr. Fergusson the degree of Doctor of Laws, of which he is pre-eminently worthy.

The Silicated Carbon Filter Company, of Battersea, are sending in, under a contract with the War Office, a further 5,000 silicated carbon pocket filters, similar to those used in the Ashantee and Cape wars. The carbon is enclosed in a china cell for protection, and the filter will be better fitted to stand rough usage. The same Company are also supplying a number of silicated carbon ambulance filters, of the pattern approved of by the Army Medical Department.

## NOTES AND COMMENTS.

THE interior of the Hôtel de Ville, Paris, which was transformed for the late *fête* and inauguration ceremony, has again changed its aspect. Men are engaged in removing all the temporary decorations, and the work of completion, which has been interrupted for many weeks, will be recommenced with energy. The artificial ceiling of the banqueting-hall, painted on canvas by M. LAVESTRE, will be recopied by the artist for that apartment when completed, and many other of the temporary decorations have been found so effective that they will be reproduced for the finished building.

THE ten competitors in the final stage for the Grands Prix de Rome (Section of Sculpture) quitted the *loges* on Thursday, the 27th ult., after seventy-two days' seclusion, and their works have been on view for four days in the Salle Melpomène at the Ecole des Beaux-Arts. The artists were MM. VERLET, QUINTON, FERRARI, PEPIN, LOMBARD, ROUBLEAU (all pupils of M. CAVELIER), CHAVAILLAUD (pupil of MM. JOUFFROY and ROMBEAUD), HANNAUX and PÈNE (pupils of MM. DUMONT and BONNASSIEUX), and GASQ (pupil of MM. JOUFFROY and HIOLE). This year's subject was a full-length figure of *Sz. Sebastian pierced with Arrows*, and it is remarkable that all the prizes in the competition should have been carried off by pupils of M. CAVELIER—viz., the first grand prize by M. FERRARI, and the two second prizes by MM. PEPIN and LOMBARD.

IN the Painting Section (subject, *The Maccabees*) the first grand prize was awarded to M. GUSTAVE POPELIN, pupil of MM. GIRAUD and FERRIER, while the two second prizes fell to members of M. CABANEL's studio—MM. HENRI PINTA and PAUL LEROY. The jury was composed of members of the Painting Section of the Académie des Beaux-Arts, assisted as usual by six artists chosen from without the Institute.

AFTER one hundred and ten days' work on a palace for the Conseil d'Etat, the competitors in the Architectural Section left their rooms on the 1st inst. The models and plans will be on view in the Salle Melpomène until Sunday next, and the jury's decision issued on Saturday, the 5th.

ON Monday Pollok House, the picturesque mansion of Sir HEW CRAWFURD POLLOK, at Newtownmearns, near Glasgow, was destroyed by fire. The building was erected about 200 years ago. It was originally oblong on plan, measuring 70 feet in length by 30 feet in width. About 1856 a northern wing was added to it by the present baronet's father. The mansion was four storeys in height, and bore some of the characteristic features of a baronial residence of the sixteenth century. The windows in the upper flats were finished above with pediments, on which were carved the arms and monogram of the POLLOK family. The principal entrance to the building was from the south, and was approached by a handsome staircase with stone balustrades. In front of the main elevation was a spacious courtyard, bounded by high, old-fashioned walls, through which there were several entrances, flanked by carved stone representations of elephants and greyhounds—supporters of the CRAWFURD-POLLOK arms.

A MEMORIAL to the Board of Trade respecting the proposed tidal canal from Liverpool has been adopted by the Salford Corporation. It states that the Corporation had heard with great satisfaction of the proposed scheme for rendering the Mersey and the Irwell navigable to Manchester for vessels of large tonnage, and that they believed such tidal navigation would contribute to prevent the serious floods caused by the overflow of the Irwell—an evil they had been anxiously considering for some years. The Corporation suggest that by the Liverpool Water Act, 1880, the Board of Trade were authorised to determine at what depth the aqueduct from the Vyrnwy to Liverpool should cross the Mersey, so that it should not interfere with the present or any proposed improvement of the navigation. The Corporation ask that the Board would take care that the aqueduct would not be an obstruction. The object of the memorial is to checkmate the Liverpool Corporation, should the latter endeavour to utilise the Water Act as a means of impeding the project.

THE Glasgow Town Council have at length agreed to exhibit the ten designs lodged in the final competition for the Municipal Buildings; but as the time is only from the 4th to the 10th inst. it is hardly sufficient to allow an opportunity to competitors from a distance to examine the designs. The Buildings Committee have also recommended the Council to co-operate to some extent with the Glasgow Institute of Architects in furthering the proposed exhibition of the rejected designs. In other words, the Corporation Galleries or the City Hall will be lent for a fortnight without charge. Whether the exhibition is representative or not will consequently depend upon the competitors themselves. Many architects shrink from owning that they have failed, and consequently are opposed to exhibitions of rejected designs. But this case is peculiar, for it has not yet been made apparent on what grounds the selection was made. It is possible that many excellent designs were invalidated on account of some trivial informality. It should be borne in mind that the Glasgow Institute is undertaking the trouble and responsibility of this exhibition entirely because it is thought that the interests of the profession demand it, and because the Institute has been appealed to by architects in all parts of the country. It acts as an impartial professional society, not as a body of unsuccessful competitors.

SEVERAL important changes have lately been made in the management of the French national museums. M. DE RONCHAUD, administrator of the Louvre, and originator of the scheme for a new school of art in connection with that museum, has been nominated Director-in-Chief of the National Collections, and of the proposed school, which is to be opened forthwith. It is further announced that a decree of the President of the Republic dealing with the organisation of the new establishment is in course of preparation, and will shortly be promulgated.

IRELAND is said to possess almost every kind of stone; nevertheless the Dublin Corporation cannot obtain from an Irish quarry materials to pave the streets of the city. There was a time when pebbles of native limestone were used, and in consequence a large outlay on scavenging was necessary. But the members of the Corporation are now more economical, although they are eager to patronise their countrymen. In the contract-deed for the Dublin paving it was stipulated that Irish stone should be used whenever practicable. The English contractor loyally accepted the clause, but without much profit to himself. He says that none of the Irish setts were dressed in a satisfactory manner, and that Irish orders placed for immediate delivery have not come forward for months afterwards. Yet it appears that there are quarries of granite that would supply half the cities of Europe within a few miles of Dublin.

M. LÉONCE CHABRY, a painter of considerable reputation, has just died at Brussels. Born at Bordeaux, where he studied under LÉO DROUYN, he afterwards came up to Paris and passed through the studios of ROUSSEAU, TROYON, and several other famous masters of landscape. For many years works by the deceased artist have regularly appeared at the Paris Salon, where last year he obtained a medal.

THE forthcoming exhibition at the Palais de l'Industrie in Paris will be on a larger scale than was originally contemplated. Many of the Paris amateurs have combined to send specimens of old artistic furniture and tapestry. The Comte PILLET-WILL has lent his famous fifteenth-century *retables*, and the Vicomtesse JANZÉ is fitting up a small salon with old furniture and hangings of priceless value. Numerous bibliophiles are arranging the cabinets that will contain their works and manuscripts. On Saturday last a van bearing the familiar royal crown and cypher, with the inscription "On Her Majesty's Service," traversed Paris from the Northern Railway Station to the Palais, bringing a number of art objects which had been lent by the authorities of the South Kensington Museum. The various Ministries have agreed to lend their treasures of antique furniture, certainly the richest possessed by any Government in the world, on the sole condition that the Union Centrale replaces them temporarily by ordinary modern furniture. The exhibition will occupy the whole nave and ground-floor of the vast building, as well as the first-floor galleries lately taken up by the Salon.

## ILLUSTRATIONS.

ACCEPTED DESIGN FOR THE PUBLIC BUILDINGS, MIDDLESBROUGH.

THIS week we publish the design by Mr. G. G. HOSKINS, F.R.I.B.A., which was submitted under the motto "Law and Order," and to which the first prize was awarded on the report of Mr. WATERHOUSE, A.R.A. The view shows the fronts to Corporation Road and Albert Road.

In the description accompanying his design Mr. HOSKINS said that it was his endeavour to obtain compactness, airiness, thorough ventilation, and good lighting and heating arrangements, together with such perfect classification and concentration of departments as to ensure complete supervision for the heads of each department, and afford every facility to the various officials for the transaction of the business of the borough, and provide amply for the convenience of the public. One particular feature of the planning is the quadrangle, the practical advantages of which over the usual method of providing a number of small useless courtyards for the purpose of lighting and ventilation cannot be over-estimated. In this case the quadrangle also serves as a means of direct communication between the various departments, as a drill-ground for the police and fire-brigade, as washing and cleaning yard, and for other purposes. It is approached by archways on the east and west sides, which will afford ample egress for the fire-engine and a large concourse of people.

The Town Hall is situated at the north end of the site, and consists of a large hall measuring 118 feet by 60 feet. This hall is lighted by eight two-light windows on the north and south elevations; and on the north or principal façade towards Corporation Road five sculptured figures, representing Art, Science, Commerce, Music, and Literature, are introduced. The floor of the hall is composed of Messrs. DENNETT & INGLE's fire-proof construction, with wooden floor above; and below the hall is a covered space of the same size, which may be utilised in wet weather for the parade or drill of the police, and also as a shelter for large audiences waiting for their carriages after leaving assemblies and meetings in the Town Hall. The DENNETT system is adopted not only as a protection against fire, but to obviate the necessity of columns, which would considerably interfere with the drilling of the police. At the west end of the building are situated, on the semi-basement plan, a heating chamber, 20 feet by 16 feet 3 inches; refreshment-room stores, 20 feet by 16 feet 3 inches; coal-cellar and urinals, with staircases rising to the body of the hall; dress balcony, and gallery; the space used for urinals being the lowest storey of the tower. The tower as it rises affords the following accommodation:—On the ground-floor the vestibule giving upon the body of the great hall; on the first-floor a like vestibule, from which access is given to the smoking-room, refreshment-room, bar, and south staircase; and above these the weight-chamber, bell-chamber, and dial-chamber, in connection with the clock. At the end of this portion of the building are placed, on the semi-basement floor, ladies' and gentlemen's dressing-rooms, measuring 20 feet by 16 feet 3 inches respectively, property-room, entrance lobbies, staircases up to platform, lavatories, coal-houses, water-closets, &c. On the ground-floor two committee-rooms, each measuring 22 feet by 20 feet, organ-chamber, platform, and staircases in connection with the same. On the first floor, two committee rooms, each measuring 28 feet by 20 feet, with staircase thereto; also main landing and external balcony, from which may be delivered speeches, declarations of the poll, &c., to the public. The sculptured figure upon the apex of gable to main west entrance represents St. GEORGE. To the south of this Town Hall block, extending the full length east and west of same, is a covered carriage-way, with a glass-roof glazed on RENDLE's system. This carriage-way makes a strong line of demarcation between the Town Hall proper and the rest of the building; and under this arrangement it would be easy to build the Town Hall block at a later date, if such an idea were entertained, without in the least way interfering with the remainder of the buildings.

The police department is situated about midway of the site, with its principal elevation towards Dunning Street. On the ground-floor are the main entrances from Dunning Street to the Police Court and police offices; over the former of which is introduced a sculptured figure representing Justice. Here is provided the Police Court, 55 feet by 40 feet. The houses of Chief Constable and Superintendent of Fire Brigade are amalgamated, although thoroughly distinct and separate in

their arrangements, within the block of buildings immediately to the south of the archway between Dunning Street and the quadrangle. A considerable portion of the accommodation for Fire Brigade is situated above the basement, and the offices of the Inspector of Nuisances and the Inspectors of Weights and Measures is situated in the semi-detached basement, and above is the auditor and cashier's office. Other rooms for the use of town officials are conveniently situated. Situated in the very centre of the Russell Street façade is a Council Chamber measuring 55 feet by 35 feet, to the north of which, and looking on to the large quadrangle, is a committee-room 36 feet by 21 feet, well lighted by two 2-light windows and one oriel window. From these windows may be witnessed in fine weather the drilling of the police and the exercise of the Fire Brigade. To the west of the Council Chamber is another committee-room, 27 feet by 18 feet 3 inches. Adjoining these several apartments are spacious main landing and vestibules which give approach to the lavatories, &c. The remainder of the space is devoted to the principal staircases east and west. Immediately below the Council Chamber is the School Board Department. The Free Library is situated at the extreme south-west angle of the site. The principal room measures 60 feet by 40 feet; and, amongst other provisions, is a writing-room for the benefit of members making reference to works. Adjoining the Free Library on the north and on the Albert Road façade are situated the Guardians' offices; and the offices of the Water Board are between the archway at the north end of the Poor Law Guardians' offices and the west end of the covered carriage drive.

The heating and ventilating arrangements have been devised with care; and it is proposed to concentrate nearly the whole of the principal drains in one focus—namely, a large and well-trapped tank or manhole in the centre of the quadrangle, from which 12-inch main trunk drain outlets will be run.

## DESIGN FOR THE PUBLIC BUILDINGS, MIDDLESBROUGH.

WE publish also the design sent in by Mr. SYDNEY VACHER, A.R.I.B.A., of 9 Argyll Street, W. The instructions for the competition were concise, yet full of detail. It was stated that the four main departments were to be placed one in each of the sides of the site, and that every department of the municipality was to have a separate entrance from the street. The Town Hall was to hold 3,500 people, and be placed in the front of site; the Police Court and Fire Brigade on one side of site; the Free Library and several boards on the other, the Council Chamber and departments connected with it at the other end of the site.

It was remarkable that all the premiated designs had small halls, and could hardly accommodate with comfort the number stipulated—viz., 3,500. This design was set aside on the ground that the requisite accommodation was not provided, as the author had forgotten to send an attic-plan showing the policemen's, firemen's, and one or two other suites of rooms, although he had written on the elevation the spot where they came. It was also objected that he had provided internal communication between the different departments, which had not been asked for, and was not required.

## DESIGNS FOR THE PUBLIC BUILDINGS, LEAMINGTON.

IN the competition for the Public Buildings at Leamington two designs were submitted by Mr. FREEMAN, of Bolton, which are now reproduced. One of them found much favour with the Corporation.

## LIVERPOOL ARCHITECTURAL SOCIETY.

BY invitation of Mr. J. C. Edwards, a number of the members of the Liverpool Architectural Society paid a visit to the Pen-y-bont Terra-cotta Works at Ruabon on Wednesday, July 26. They were conducted over the works by Mr. J. C. Edwards, Mr. E. Lloyd Edwards, Mr. Richardson (chief of the Designing Department), and Mr. Bryan (general manager), who thoroughly explained the successive stages of manufacture. Commencing with the clay-getting, the party were conducted first to the huge pit from which the clay is obtained, and where clay-getting in its various forms was in operation: *en passant* it may be said that the stock of clay is practically illimitable. Thence they were taken to the grinding and pugging mills, through the engine-house, and from there in succession through the brick-making department, "wire-cut," "patent-pressed," and "moulded" bricks of every type being in process of manufacture; next through the drying-sheds, where all the waste steam is made available for the purpose; and so into the

portion of the works where ordinary thick quarry tiles are made; thence through the Terra-cotta Department, where huge blocks destined for the main cornice of the *Manchester Guardian* Offices, the Rainhill Lunatic Asylum, and other prominent buildings, were being turned out, together with every conceivable form of moulded work required throughout a building, including balustrading, heads and bases of columns and pilasters, carved panels, swags, pedestals, terminals, vases, ridge tiles, &c., made to order for buildings in every part of the country. A visit was then paid to the modelling-room, where a number of men and boys were at work modelling in plaster of Paris, from designs either made by Mr. Edwards or sent to him by architects to be carried out. The foundation of this department was understood to be due to the energy of the general manager (Mr. Bryan), who gained his knowledge in the South Kensington Schools, and has here raised a school of modelling of which any man might be proud, the material upon which he has had to work being entirely local talent, in the shape of National School boys, who have been trained to a pitch of excellence which is surprising. The party next went through the drawing-office, where a number of draughtsmen were at work, presided over by Mr. Richardson (a pupil of Mr. Verity, of London). The drawings of works in hand were inspected, and then the roofing tile department was gone over. Here the manufacture of roofing tiles in all its branches was thoroughly explained, and the encaustic tile department entered. This portion of the works is under the management of Mr. Denny, and he very clearly explained in a practical manner the entire process, which was generally pronounced to be of a most interesting character. Thence the clay-mixing rooms (for colours other than those of the natural clay); the fitters' shop, where the intricate patterns for encaustic tiles are made; the pattern-room, where thousands of patterns of moulded bricks, &c., are stored, and the tile store-room, were successively explored, and in the latter numerous entirely new samples were exhibited, which were very favourably commented upon. The tile-glazing process and firing were then explained; and finally, several kilns just being drawn, were entered and the contents examined.

Many acres of land are covered by the works, and they are a surprising instance of what can be done with capital and energy combined, the whole being the result of only ten years' work, and having been built up bit by bit as the trade was found to develop—one department after another being added as required; reflecting the greatest credit on Mr. Edwards' ability and indomitable perseverance.

So much time had been expended in going over the works, owing to the interesting nature of the manufactures, that a proposed visit to Mr. Edwards' fireclay and yellow terra-cotta works at Trefynant had to be abandoned, and the party were driven to Mr. Edwards' residence, Trevor Hall, where they were most hospitably entertained.

### "GREAT ALCAIRO."

MR. F. T. PALGRAVE, in a letter to the editor of the *Times*, writes:—Before it is too late, if indeed it be before, I ask leave to present a plea in which I am sure of the sympathy of all civilised mankind on behalf of special and immediate measures to save that great city which Milton conjoined with Babylon as the type of Eastern magnificence. From the day on which

Portus Alexandria supplex  
Et vacuum patefecit aulam,

it has been obvious that Cairo was likely to suffer the same fate; and the general tendency of later intelligence now points to that fate as imminent, unless energetic steps are at once taken by our forces. The destruction of the European quarter is prophesied, but I apprehend that in a city so constructed as Cairo there will be no power to limit the flames and spare the ancient capital, even if the wish existed among the Communist hordes of Arabi.

On the loss of life and wealth, the waste and the woe, the shock to unhappy Egypt and her loyal ruler, the material and political evils of such a catastrophe I need not speak. These direct human interests must come first in our thoughts and in the measures to be taken by our gallant forces. What, however (in default of protests from men who personally know more of the land and its literatures and its antiquities), I wish earnestly to enforce is the blow to the higher and permanent interests of civilisation in Europe and in the East which would also thus be given. Perhaps this element in the East is not fully or generally known. The wretchedness of war, sufficient, one might think, in itself, is perceptibly increased and rendered far more lasting when the field of warfare is one signally consecrated by the triumphs and the treasures of peace. We all feel this if Athens or Rome be named. Cairo is another of the memorial cities of the world. Besides its singular picturesqueness, it is, architecturally, the most brilliant and typical example surviving of the old Arabian splendour, in its dwellings and its public buildings, a treasury of exquisite ancient art, if destroyed, simply irreplaceable. But there is much beyond this. Cairo contains now the great local collection of what has been rescued from the tombs of

ancient Egypt; it has become the great repository of the golden age of Arabian literature; its manuscript libraries hold the (often unique) texts of the famous poets, philosophers, and historians of the early Caliphate; it is the Alexandrian Museum of a civilisation which long preceded our own. In virtue of these relics Cairo is the one link which unites the strange splendours of ancient Egypt with the nineteenth century; it might be called the best surviving representation of those amazing efforts of art and intellect which, under different forms, connect us, through the days of the Ptolemies with the days of the Pharaohs and the first dawn of human civilisation.

The political elements in this lamentable conjuncture I wholly put aside. But, by the consent of Europe, by the consent of our consciences (however inevitable the course pursued, with its consequences, may have been), in the present state of Egypt *pars magna fuimus*. But it is simply for a service in which, by the very nature of the case, we must necessarily act as the "mandatories of Europe," that I here plead for the rescue of the finer, the peculiarly fragile, interests of humanity from those peculiar perils of barbarism which civilisation inevitably prepares within itself for its own treasures.

What compensation can be found, when order is restored, for losses such as are here involved? The process of the years may, we know, hide the miseries and desolations of war beneath the overgrowths of peace, after even a comparatively brief interval. But when centuries have passed, one such loss as would be that of the treasures stored in this city is remembered among men—is deplored, is execrated. There is here, I hope, an excuse for my appeal. If it be anyhow possible, let us not, for any mere reason of the moment, leave it to be said of England that from the ruin which legend ascribes to Omar in Alexandria, she might, in real truth, have saved Cairo, and did not.

### THE AMENDMENT OF THE LAW OF LIGHT AND AIR.

THE eighteenth number of the "Proceedings" of the Institute of British Architects contains several communications which have been addressed to the Special Committee on Light and Air. The following extracts will indicate the amendments suggested by architects:—

Mr. J. Whicford: The ultimate object of this Committee should be to devise a system of general application, defining a precise minimum distance and maximum height for new structures in relation to ancient lights; so that while such limit was observed a new building might be erected without risk of interference. But as all cases could not be brought within such a rule, the Committee should consider the character of tribunal best suited to finally adjust questions of the kind. In these exceptional cases the discretionary powers of a tribunal are most valuable. Only a tribunal could give on the one hand the fullest relief to an aggrieved party, especially where any intention to overreach or coerce was detected, and visit vexatious interference on the other hand with heavy fines, as well as costs. To suggest how such a tribunal should be constituted, whether an Equity judge should preside, and whether a practising architect of position could be fairly put forward as a proper assessor, is a material point for the Committee to discuss. I am of opinion that a general law could be founded on the judgment of the Master of the Rolls in the case of *Hackett v. Baiss*—a judgment which practically adopts the angle of 45° as the limit to which a building owner should be restricted—but to make such a judgment of general application it would require some enlargement in its terms. It would be necessary to define the distance at which an obstacle shall approach an ancient light; for example, if an angle of 45° is deemed to be the proper general angle, where properties abut, a roof of a new (or obstructing building) might at its starting-point be brought into contact with an ancient light, and this would be obviously an injury. I think, however, that this difficulty could be met. It might be laid down that, where no street or other space intervenes between an ancient aperture and the obstructing building, the latter shall in no case be brought at its starting-point nearer than feet to such ancient aperture. To my mind, the preservation of the incidence of light and air to an ancient aperture at an angle of 45°, both directly and laterally, would be a good law of universal application. In fact, though no angle is ever admitted by the courts, the angle of 45° is practically the limit adopted by experienced professional men, and I contend that it is only in very exceptional cases that it does not apply. If it were made law, nineteen-twentieths of the actual harass and difficulty would be at an end, though obviously it will be necessary to show that the general advantage of such an alteration in the law would greatly outweigh any possible interference with abstract right. It will also be advisable to consider whether in large towns under certain conditions the prescriptive right to light and air ought not to be abolished altogether, and whether, on the grounds of public expediency, Parliament should not be memorialised to that effect. Under the present state of the law it frequently happens that an old, often disused and petty aperture dominating an adjoining area, is the cause of infinite waste and mischief, and able to mar for no

good purpose whatever the usefulness and beauty of a new architectural structure.

**Mr. Arthur Cates:** The attention of the Committee should, in the first instance, be directed not to an attempt to devise some scheme for diminishing the evils which, at all hands, it is admitted the present law, as now administered, permits and encourages—thus accepting the present state of the law of light and air as equitable and correct—but rather to investigate the principles on which it is alleged that such law is based. To trace out as far as possible the state of things prior to the Prescription Act. To ascertain the reasons which influenced the Legislature in enacting the particular clause under the alleged authority of which so much extortion is practised. To trace out the manner in which this clause has received so wide an interpretation as is now given to it, and whether such authority was intended to have so extended a scope. To illustrate the mischievous and unjust action of the law, and the opportunities it offers for oppression and extortion, and thus give good reason for the pressing necessity for a change. To inquire into the law of other countries on this subject. To inquire into the municipal and building regulations in force in other countries, which in their application affect the altitude, position, and plan of buildings, so as to protect, in the result, adjoining tenements from injury. To consider whether some municipal regulations might not be framed—and so regulate the height of buildings in towns—and be made by law of universal application in England; and, as regards rights of light which are manifestly encroachments on the rights of the servient tenement, to consider how such servient owner could be effectually protected by the Scotch system, or otherwise from the aggression of his neighbour—the real evil-doer, and first aggressor—the dominant owner. Until the impossibility of obtaining a change in the present law has been clearly shown, any discussion of schemes for the palliation of the evils it causes would be undesirable, and they will not at present, I hope, engage the attention of the Committee.

**The late Mr. G. Somers Clarke:** My suggestion to the Committee would be to report that the present law, 2nd and 3rd William IV. c. 71, which gives a dominant owner a controlling and arbitrary power for all time over the servient owner's property, thereby checking, except under heavy and uncertain penalties, all possible improvements in accordance with the advanced spirit of the times, is of itself contrary to a wise public policy. That it should therefore be abrogated, so far as the powers apply to the fronts of buildings next public thoroughfares, no matter the width of the latter. That every building owner should be at liberty to erect his new edifice to any height his requirements demand, independent of his opposite neighbour. That the present Act of Prescription should be solely confined to back walls, skylights, and back yards or internal courts between adjacent properties, and not giving upon public thoroughfares. That a professional assessor should sit with the judge trying the Light and Air cases, to assist him in all technical points connected with the exhibits and models submitted by the respective litigants. These assessors should be selected, from their special experience on the subject, by the Council of the Institute, and submitted for the approval of the Court of Chancery before appointment. With an experience of twenty-five years in erecting new buildings in the City of London, I can recollect no one instance in which the money compensation, or any portion of it, accepted by the dominant owner as a solatium for loss of light, has been devoted to increasing the apertures or window openings on his own premises, so as to mitigate the alleged loss of light complained of. It may fairly be assumed, judging from these facts, that in a very large proportion of cases settled by compensation the alleged injury has been one of imagination, precedent to the erection of the building, and found subsequently, on its completion, an illusion.

**Mr. Edward N. Clifton:** With reference to these questions, which were referred to a special committee of the Royal Institute of British Architects, I have a few observations to make. To members of the Institute the questions have a wider range than the simple cases submitted for the decision of the Law Courts, particularly with regard to sanitary and architectural matters. In any decision to which the Committee may arrive these will have to be most carefully considered. Several propositions have been suggested:—1. That a building owner should be allowed to carry his building to any height he pleases on paying compensation for any injury he may inflict on his neighbours. To this I most strongly object. On sanitary grounds, it is very undesirable that enormously lofty buildings be permitted under any circumstances in the narrow streets of our crowded cities. Architecturally also I think it would be a mistake in such streets to have buildings of the height of, say Hankey's in Westminster. Recent legislation has been in the direction of limiting the height of buildings, having regard to the width of streets. In this limitation I fully concur. The next proposition is the repeal of the Prescription Act. I am equally opposed to this. Numerous rights have grown up under the provisions of this Act, and to destroy them would involve intolerable hardship upon those who have so acquired them. My suggestion for amending the present state of things is as follows: I would strictly define the height to which buildings may be carried in all streets, having regard to their width, and also the height in back yards; and this to be applicable to the whole

kingdom. I have little doubt that, from the experience of many on the Committee, some satisfactory settlement of these heights may be arrived at, without unduly infringing the rights which any adjoining owner has. Probably some modification of the law in France might be made to suit this country.

**Professor T. Hayter Lewis:** The consideration of this subject may, for convenience, be divided into—first, the erection of buildings otherwise than towards the public street, and thus not affecting the interests of the public in general; second, the erection of buildings towards the street involving the interests of the public generally, as well as those of adjoining or opposite owners; third, the invasion of privacy and acquisition of rights to light and air by the opening of new windows overlooking the neighbour's premises. And the questions relating to the above cases are: (a) whether the right at present obtained by a twenty years' enjoyment of the easement, and by other means, could be made less onerous on building owners? and (b) whether the means of ascertaining the injury sustained could be made more definite?

1. No one can doubt that the twenty years' easement often acts in an exceedingly hard way (often absurdly so) on an adjoining owner. I recall one case, *e.g.*, in which some small openings, almost disused, in a long range of stabling which was soon afterwards pulled down, absolutely stopped, for a considerable time, the use of some valuable building land in their rear.

2. Further, the easement often acts prejudicially to the dominant owner himself, by making it imperative on him, in rebuilding or altering his premises, to preserve the precise ancient openings (or such part of them whose rights he wishes to preserve), no matter how much this preservation may interfere with his design in his rebuilding.

3. Nevertheless, the right which this twenty years' easement now confers has been so thoroughly recognised in all our Law Courts, that I think it hopeless to attempt any essential modification of it. This right, acquired by twenty years' user, will probably be strengthened by the decision in the case of Dalton and Angus, wherein it is now decided that a twenty years' user gives a right to lateral support.

4. There is, however, another means of acquiring the same right as by user—viz., in the case of two premises belonging to the same landlord, one of whose tenants acquires at once, on obtaining his lease, the right throughout his tenancy to enjoy the same amount of light and air as he then enjoyed. This was prominently brought forward by Mr. Locock Webb at the discussion at the Institute, December 17, 1877; but the existence of the right is but little understood, and has often, to my knowledge, worked with great harshness. Its restriction could do little, if any, injury to anyone, and might perhaps be obtained.

5. In regard to the twenty years' easement, it is proposed by Professor Smith to allow the building owner to acquire the right of obstructing any ancient light by giving compensation to its owner. I confess that I should, in any case, have had very great doubts as to the justice and expediency of this; but after the opinion of Mr. Locock Webb, it really appears to me that it would be useless to aim at so great an alteration in the law, even if we really desired it.

6. Another suggestion of Professor Smith's, improved upon by Mr. T. Chatfield Clarke, seems to me a much more practical one, and to be well worthy of attention, viz., that the building owner should be compelled to give notice to any one whose ancient lights are likely to be affected—such notice to explain exactly the nature and extent of the proposed new building, and to be served in much the same way as party-wall notices now are. I doubt the expediency of a more extended notice by advertisement. In many cases this would lead to an amicable arrangement at the outset.

7. Supposing that no agreement were arrived at, and that the case came into the law courts, the course suggested by Mr. T. Chatfield Clarke, viz., for the judge to have the case reported on by a professional adviser, would seem to be also a step in the right direction.

8. But in any disputed case there would arise the questions as to the method of determining the precise injury likely to be done. The 45° angle may now be considered as obsolete, and recent decisions seem to leave the nature of the method more vague than ever. In the case of "*Lawes v. Carter*," recently decided by the Master of the Rolls, he said that, "as the law now stood, a man might diminish his neighbour's light to a certain extent, and the remedy depended upon the degree of obscurity."

9. The result appears, therefore, to depend even more than ever upon the opinion of witnesses, and I have found that the evidence of unprofessional witnesses is quite as conflicting and as puzzling to judge and jury as that of professional men.

10. I confess that I can see no definite principle on which the amount of injury, if any, can be decided.

11. But when we think of the great hardship which is often caused to a building owner by easements of light in some unimportant part of his neighbour's premises, and the ease with which the injury could often be obviated by some slight alteration in those premises, as pointed out by Professor Kerr, we are tempted to think that power might be given for the law to take this into consideration and to determine accordingly.

12. In regard to the houses abutting on the public streets, and

where, therefore, the interests of the public generally are concerned, I think that where the streets are newly formed some such rules as those enforced in Paris, as quoted by Mr. Arthur Cates, might well be adopted.

13. But such restricting rules would never be allowed in streets now made, as they would act with extreme harshness in such cases as, *e.g.*, the narrow streets and lanes in the City.

14. The third point, in regard to the erection of new buildings with windows overlooking a neighbour's premises, often causes a very serious depreciation in value of the said premises; but I presume that the question of privacy would be treated by the law courts much in the same way as would be the interception of a beautiful view.

15. But an equally important point is the right of light and air to be acquired over the neighbour's premises by an uninterrupted user of twenty years. The present mode of preventing this by screens is very objectionable and very difficult, and, lastly, when the new buildings are of great height it seems to me that when windows in a new building are to be opened overlooking a neighbour's premises, notice should be given to him and some power of restriction allowed to him.

### ST. JOHN'S WOOD SYNAGOGUE.

THE St. John's Wood Synagogue was consecrated on Sunday last by the Rev. Dr. Hermann Adler, Delegate Chief Rabbi. This building occupies an admirable site at the corner of Abbey Road and Marlborough Place. The architectural character of the building is Byzantine, original and freely treated; it is faced with red Fareham bricks, with terra-cotta and Dumfries stone dressings and ornamental details. The elevation facing the Abbey Road consists of a colonnade of arches, supported by red Dumfries stone columns with enriched capitals; this colonnade is flanked by two turreted towers with a gable between. The elevation to Marlborough Place is of a more simple character, but treated with the same architectural effects. The colonnade is approached by a broad flight of steps, leading into a vestibule 13 feet wide by 27 feet long. At each end of this vestibule is a staircase leading to the ladies' gallery, situated on the first-floor level. Under the stairs on one side is the secretary's office, and on the other side gentlemen's cloak-rooms, retiring-rooms, &c.

The ground floor of the synagogue is entered from the vestibule by three large doors opening outwards, and can also be approached from the east end, where additional doors have been provided so as to afford every facility for ingress or egress. The first floor has been, as before mentioned, appropriated to the ladies' galleries, which are very wide, and have broad passages behind the seating so arranged as to prevent crowding, to ensure decorum, and in the event of panic to afford an easy means of egress; the galleries have no less than four doors devoted to their use. The west gallery is carried over the vestibule, and thus forms an architectural feature of the interior. Off the landings of the staircases are ladies' retiring-rooms, lavatories, &c. On the second floor is a large committee-room, with lavatories and retiring-rooms attached.

The synagogue proper consists of a centre nave and two aisles, the galleries being supported upon coupled iron columns of ornamental design; these columns are carried up to the ceiling. An ornamental screen forms the gallery front, enriched with a vine-leaf running ornament and ornamental iron panelling. The west end is formed by a series of arcadings in harmony with the other portions of the gallery, and the east end is devoted to the ark or sanctuary, which is formed in a deep arched recess, approached by a flight of marble steps. The chamber for the reception of the Scrolls of the Law is approached from the sanctuary recess, and is of a very ornamental character, its entrance being flanked by marble columns with enriched capitals supporting a tympanum, and decorated with symbolical enrichments. The windows are fitted with stained glass from the architect's design, and executed by Mr. William Gibbs, of 397 Kingsland Road, N. In the sanctuary recess, on a level with the gallery, the windows are filled with geometrical stained glass, the centre having the Ten Commandments written thereon.

Great care has been exercised so as to render the fittings convenient and comfortable. The seating is of pitch pine, stuffed and upholstered, and is arranged in short blocks, having ample passage ways, so as to provide every convenience for the worshippers. The seating has been executed by Messrs. Cohen & Sons, of Curtain Road. The almezer, or reading-desk, is of pitch pine, having the choir behind and the warden's seats in front. A pulpit has also been provided, and has been executed from the architect's design by Messrs. Cox, Son, Buckley & Co., of 28 Southampton Street, Strand. The dimensions of the synagogue proper inside the walls are 58 feet by 45 feet 6 inches, and the height of the ceiling is 31 feet 6 inches.

Owing to the necessity for consecrating the building before the members of the congregation and their friends leave town, the time has been limited to complete the decorations of the building, but a portion has been executed by Mr. Rich of Fortys Road, Kentish

Town, under the direction of the architect, which although simple in character, evidences an appreciation of harmony and colour, and will greatly add, when fully completed, to the general pleasing effect of the interior.

The heating and ventilation have been carefully considered. Pure air is admitted into the building in a vertical direction, either at a cold or warm temperature, and the impure or vitiated air is carried off by means of ventilating ducts which have been provided over and under the galleries and in the main ceiling, an upward current being induced by means of Bunson's gas-burners.

The synagogue will accommodate on the ground floor about 240 male worshippers, and in the galleries about 250 ladies.

A separate house has been built for the beadle, containing every convenience. The cost of the building, exclusive of the purchase of the site, furniture, &c., will be about 8,000*l.* The builders are Messrs. Kirk & Randall, Woolwich, who have faithfully executed the work to the satisfaction and approval of the architect, Mr. H. H. Collins, F.R.I.B.A., M.I.S., &c.

### THE GOVERNMENT AND ELECTRIC LIGHTING.

SIR FREDERICK BRAMWELL has reprinted his letter to the editor of the *Times* on the Government Electric Lighting Bill, a measure by which it is proposed to interfere with public enterprise in undertaking works of magnitude. He says:—

I believe that very few of the public, and, indeed, very few of the members of the House of Commons, are aware of the gravity of the principles which are involved in the provisions of the above Bill.

It is but too commonly assumed that, being a Bill for a specific object, that of electric lighting, its provisions can but little concern those not interested in that lighting, unless, indeed, they be persons engaged in the supply of gas. Such an assumption is, however, by no means warranted, as the principles which underlie the Bill are, I fear, intended to be of very extended application.

In your leading article of Monday you enumerate the advantages attendant upon electric lighting, as set forth in the evidence of the President of the Royal Society—advantages so great that all must desire to see electricity laid on for domestic use, a desire shared in, I presume, by the Board of Trade, or they would not have introduced the Bill. I feel, therefore, I am entitled to say that the Electric Bill must be taken as intended to give facilities for bringing into practical commercial use a meritorious, but as yet undeveloped, undertaking, and that electric lighting is clearly not to be looked upon as some objectionable thing, which, although it cannot be wholly stopped, should as far as possible be kept down by restrictions; and therefore, I presume, it may be taken as conceded that the Government would not seek to weight such an industry in its very outset by burdens greater than those which it would see fit to impose on other older and fully developed, but certainly not more meritorious industries. This being so, I fear it follows that the most cruel conditions of compulsory giving up of the undertaking which are imposed in the Bill upon electric lighting, will, at the very first opportunity, be imposed in all cases where private enterprise seeks Parliamentary powers to enable it to supply public needs.

In your article of Monday you stated what these conditions are, but let me repeat them. The Electric Bill, by clause N of section 14, provides that where the lighting is done by an individual or by a private company, under a provisional order confirmed by an Act of Parliament, then at the end of fifteen years the local authority of the district lighted shall be entitled to say that it desires to purchase the undertaking, and thereupon the undertakers shall be compelled to sell. This in itself would be a sufficiently hard provision were the terms of payment fair; but the terms of payment are most unfair, for the arbitrator who, failing agreement, is to fix them is forbidden to take into account in so doing either past profits, goodwill (which means present profits), future profits, or any allowance for compulsory sale, and, having been thus told what he is not to allow, he is directed to ascertain the then value of the land, buildings, machinery, and plant, having regard to their suitability for the purposes for which they are intended, and this is to be the sole payment for the acquisition of the undertaking. Further, if the local authority should not choose to exercise this option at the end of fifteen years, then at each recurring period of five years the same option is to re-arise.

As I have said, there is nothing in the nature of electric lighting to justify exceptional harshness; on the contrary, it is regarded with approval, and thus, if there be any exceptions, it is to be supposed they would be exceptions in favour of this useful, desirable, but undeveloped industry. I fear the obvious conclusion to be drawn from the foregoing considerations is that in all future applications to Parliament for a Bill to light a town with gas, or to supply it with water, or to make a new railway from A to B, there will, in the interests of consistency, be inserted provisions that at the end of the fifteen years the local authority may buy the gas undertaking at the then value of the fifteen years' old pipes and

fifteen years' old works, that it is to get the water-works on similar terms, while the railway, extending over the districts of many local authorities, will be doomed to be acquired by the Government for the then value of the land, works, rails, and rolling-stock.

Is the country prepared for this? Has the time come when private enterprise, which, I believe, has made this country what it is, shall be discouraged, and such undertakings shall pass into the hands of governing bodies, be they corporations, local boards, or the Imperial Government?

I believe that the making of the governing bodies into traders is one of the gravest of mistakes. Many valid and weighty reasons could be adduced in support of this proposition, but I must not trespass upon your space. There is one matter in which, perhaps, a governing body may be allowed to be interested, and that is in the supply of water. There are two circumstances which render this different from any other kind of supply or trading—one is that it is so unlikely as to be practically impossible that the commodity will ever be superseded, and the other is that on sanitary grounds it is necessary to charge persons for water on the basis of a rate, and not according to the quantity used, just the same as I, living in a moderately good house, pay more for my share of the lighting, the paving, and the use of the sewers than is paid by an artisan deriving just the same benefit from them; so I, living in a house of that kind, pay some 1s. 6d. to 2s. a thousand gallons for all the water I use, in order that the artisan may have the water that he uses for some 2d. to 3d. the thousand gallons. These exceptional circumstances may possibly justify the supply of water by a governing body, although even a water undertaking is, I believe, best conducted when the supply is in private hands and the public body is confined to the supervision.

One further observation, and then I feel that I must stop, not because that which I have to say upon the subject is exhausted, but because of the length of my letter. It must not be supposed by any of the public who are not conversant with such matters that the mode proposed for assessing the amount to be paid by the local authority for the acquisition of the undertaking is universal or even common. On the contrary, there is not a single instance of such a mode. The only thing bordering upon it is that given in the Tramways Act, 1870, and it would be perfectly easy to show, as I have shown elsewhere, the wide difference that prevails between the case of the tramways and that of the electric light; and, moreover, when it suits the public body to purchase upon income, then pains are taken to make sure that income shall be the basis. Let me refer to the Act of 1870 for freeing the toll-bridges of the metropolis, and it will be found there (section 5) that these undertakings were to be acquired upon regard being had to the net annual value of the tolls. It was well known that the bridges were yielding inadequate dividends. It was well known that had they been acquired for the then value of the lands and buildings, having regard to the purposes for which they were intended, the sum to be paid would be, in many cases, a very large one—practically that which a new bridge would cost, less the small depreciation. Thereupon care was taken to ensure that the acquisition should be upon the revenue. I was engaged in several of the arbitrations, and among others, in that by which Waterloo Bridge was acquired. This bridge, with its approaches and land, cost 1,050,000l. sixty years ago. It would have cost very much more at the present day. Nevertheless upon a sum arrived at by the capitalisation of the net revenue, that bridge was acquired for 475,000l. Sir John Hawkshaw stated that the very lowest cost for which the bridge and the approaches could be made at the present day, wholly irrespective of land, was 700,000l. Notwithstanding this foreseen result, I, who was consulted by the Bridge Company, felt that no objection could be urged against the principles of payment arrived at by capitalising the revenue. But this, the right principle, has not been followed out in the Electric Bill. There, at the end of fifteen, twenty, twenty-five, and every period of five years after the fifteen, the local authority watches to see if there is a profit, and if there be, then it comes in and buys, not upon the profit, but upon the materials. If there is no profit, so that it would not be worth while to buy the materials in order to earn the income, then there is no obligation on the local authority to buy at all, and thus in effect the Bill says:—"As long as there is no profit or a poor profit, you, the undertakers, may continue to work, but the instant you get anything like an adequate return, then we will come and buy you up, at a price which must inevitably be a comparatively small fraction of the capital you have laid out in your undertaking." I feel compelled to repeat that which I told the committee, "This is a monstrous proposal."

It is on the foregoing grounds, I say, that the passing of this Bill must be looked upon as the beginning of the end of the carrying out of public enterprises by means of private capital.

With respect to electric-lighting companies, I believe there is plenty of isolated work for them to do, to make a return to their shareholders, but this Bill will deprive the general public of the benefits of electric lighting. The local authorities will not dare to embark in a comparatively unknown undertaking, and private companies will refrain from doing so with these inequitable conditions of payment on compulsory purchase staring them in the face.

## BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE members of the Bristol and Gloucestershire Archæological Society this year selected the district of Stow-in-the-Wold for examination. The annual report, which was read at the opening meeting, stated that there are 446 annual members and 74 life members in the Society. The Council were gratified to be able to announce that during the last year Lord Fitzhardinge had very liberally and courteously given his consent to the very valuable MS. of John Smyth, the antiquary, written in the early part of the seventeenth century, and the ancient MS. register of the Abbey of St. Augustine, Bristol, which are preserved in the muniment room at Berkeley Castle, being printed by the Society for its members. During the present year a very valuable work, entitled "Archæological Handbook of the County of Gloucester," would be privately printed by Mr. G. B. Witts, one of the members of the Society. By a careful personal survey of the whole county, Mr. Witts had been enabled to discover a great number of Roman and British camps, Roman villas, British remains, and barrows, which had been hitherto unknown.

An address was delivered by the president for the year, Mr. Rhys Wingfield. In the course of it he said that, although less full of archæological remains than some districts, Stow was rich in associations of the past. During the time of its Roman occupation it was on the Foss, probably a look-out station, even as it was now from its eminence a landmark to all the country round. There they might meet with the Saxon monk in his cell, with his namesake the Confessor, from whom the town took its name, and so admirably sculptured over the door of Edward's Hall, where they then met, which for its use and beauty was not unworthy of St. Edward's patronage. They met there Essex on his way to the relief of Gloucester; they heard the clash of arms as he was opposed by Rupert. On the other side of Stow they heard Sir John Astley, after his last effort for the king, giving his captors the far-seeing counsel: "Gentlemen, you have done your work; go home, but mind you do not quarrel among yourselves." The church contained a "Jesus Chapel" for the guild of well-to-do woolstaplers, whilst the whole fabric was converted into a prison after the aforementioned battle. Then, again, the "Swells" contained plenty of interest and instruction. They supplied long and round barrows in profusion. The Manor House at Upper Swell, with its Jacobean fireplace, was associated with the Gloucestershire families of Stratford and Chamberlayne. The Bolde in Lower Swell was enlinked with Richard, Earl of Cornwall, at the one end, and Sir Robert Atkyns, the historian, at the other; and the chancels of both these churches were of much interest to the ecclesiologist. Next came Slaughter. The late discoveries made there by Mr. George Witts, the nine-gabled Manor House, the old family of the Slaughters running back almost to the Conquest, and the church so faithfully restored, provided splendid material for archæological discussion. That would end what he hoped might prove a successful day's excursion. On the following day they would begin with Icomb. Icomb Place was a unique specimen of a knight's home in the fifteenth century. Its association with the great names of Blackett, Baskerville, and a long train of others, invested the place with additional interest, whilst the church was a charming little gem of the Lancet Period. Bledington Church would be a great treat, with its many singular features and its fine collection of fifteenth-century glass. Chastleton, though over the county's confines, was too near to resist a visit there. The camp giving its name to the village they would find in a good state of preservation—originally British, but modified by Roman, and subsequently occupied by Saxon and Dane. The manor was connected with many distinguished personages, and it was through Catesby involved in the Gunpowder Plot. The church there was also a study for the ecclesiologist. On their way home they would pass through Daylesford, the ancient domain of the Hastings. Here they would find the tomb of Governor Warren Hastings, in the most elaborate church of modern time. They would look in at the old church of Oddington, now disused, in which were traces of frescoes, which it was to be hoped some of the society would be able to help them to decipher. Bourton, anciently called Salmonsbury, with its once spacious camp (of some 60 acres), and with its treasures brought to light by the new railway cuttings, he would leave to one to whom the archæologist owed much, Mr. J. Moore. At Farmington no doubt there was an extensive Roman villa concealed. The church also had its especial features, and a ship's rudder, connected with the name of Tagson, awaited explanation. Norbury Camp, and its long barrow within it, in a line with Cirencester, Bourton, and Doon Camps, each about equidistant, told of British occupation and obstinate resistance. The church at Northleach was a glorious pile, with a mighty tower, and a perfect porch. It dated from the fifteenth century. Hampnett Church, another Elkstone, was a surviving specimen of what our small village churches were in the Norman days. The register there was interesting in many respects: in this, for one, that it gave the measure or extent of a yard. Notgrove Church, as in the cases of Bledington and Slaughter, would be ably described by Mr. Cutts. The Manor House, connected by relationship with

Dick Whittington, would crown, he hoped, their excursion with what attended his career, namely, success. He had only to add one regret, that their excavations at Barrington, although it had been considered conclusive that they were of Roman origin, had not been deemed of sufficient importance to find a place in the programme, and allow him the opportunity of entertaining them at Barrington.

The parish church of Stow was described by the rector, the Rev. R. W. Hippisley. The building had, he said, undergone many transformations. Traces of Saxon, Norman, Early English, Decorated and Perpendicular work were to be discovered in the church, which had been restored by Mr. Pearson. It was clear that the tower was built after the chancel. The chancel arch was certainly peculiar, but he did not think it was pretty. Outside the church the old line of the masonry could be traced. The older parts of the church were built of the local stone of the country, whereas the other parts were built of better stone. The strength of the church was not comprised in the size of the stones with which it was built, but in the great thickness of the walls, which he believed were put together with concrete. Having occasion to examine the upper wall of the chancel, they came upon the stone roof, showing that the chancel was originally covered with a stone roof. He pointed out the chapel in the north aisle which had been dedicated by the woolstaplers and called Jesus Chapel. In the church is a large painting of the Crucifixion by Gasper de Crayer, of Flanders, a friend of Rubens and Vandyke. The date of the work is 1610. It was stated that the figure of our Lord was painted by Rubens himself, and the other figures in the picture by his pupils, though the credit of the work is given to Gasper de Crayer in a brass plate fixed in the wall beneath it.

#### Stow Cross.

At the evening meeting a paper on the old cross at Stow was read by Mr. H. Medland. It was, he said, supposed to have been erected in the fifteenth century by Robert Chester, the same man who instigated and contributed largely to the erection of the tower of the church, and who also obtained a licence to found the Holy Trinity Guild, and to erect a chantry, to which latter purpose he probably appropriated the north transept of the parish church, otherwise called the Donington Aisle. The roof of the nave of the church is supported on twelve well-carved stone corbels, principally representing human heads, which are supposed to be portraits of the leading people of the town, namely, the rector, the chaplain of the Trinity Guild, the benefactors of Stow, and their wives. Amongst them is one which is supposed to be a representation of the said Robert Chester. In Pooley's "Ancient Crosses of Gloucestershire" there is an accurate drawing of the cross as it existed before restoration. The remains consisted of the base, about seven feet square and two feet high, two steps, square socket broached into an octagon, and a monolithic stop-chamfered shaft about seven feet high. The base and steps had become much dilapidated owing to the running up and down of children. The late Lord of the Manor, Joseph Chamberlayne Chamberlayne, on March 29, 1871, generously gave the sum of 2,000*l.* to secure a supply of pure water to the town; and it was to commemorate that and other of his benevolent deeds that a sum of money was subscribed by the inhabitants of Stow wherewith to erect some fitting memorial of him, and which eventually resolved itself into a scheme for the restoration of the old cross. The form of the top of the shaft, and the fact of it not being quite square, led to the supposition that the original headstone must have been somewhat like those of Ashleworth and Ampney Crucis, which have consequently been taken as a guide or precedent. The carvings in the headstones of these crosses are more or less of an historical character. The restored headstone is gabled and the two ends are coped, with a moulded and cusped niche, which (with the exception of that on the south side, which is occupied by a road) are filled with carvings representing objects of local interest. That on the north side represents Robert de Jumieges, Abbot of Evesham and Lord of the Manor of Stow, receiving a charter from William Rufus to constitute Stow a market town; the accessories, such as the throne, shielded with arms of Rufus, &c., are in accordance with the period of his reign. The niche on the west side contains a figure representing Robert Chester, with a model of the church tower in one hand and the old cross and Chester's arms, on shield, in the background. The head and head-dress are copied from the corbel in the church before referred to. The east niche contains a portrait of Mr. Joseph Chamberlayne Chamberlayne, to whose memory the cross is restored, with the manor house and shield, with his arms in the background. The headstone is surmounted by a floriated cross, the entire structure being 19 feet 6 inches high. A substantial wrought-iron railing has been fixed on the restored base to prevent a repetition of the mischief which caused previous damage. A cast-bronze plate with an inscription is let into the socket on the south side. The stone used in the restoration came from Farmington, with the exception of that used for the carved headstone, which is from Sireford. The restoration was carried out under the direction of Messrs. Medland & Son, architects, Gloucester.

#### Chastleton and Icomb.

A paper on Chastleton and Icomb was read by the Rev. D. Royce. Chastleton furnishes one of the first instance of a vicarage

in England. We find mention of the church being dedicated in the twelfth century. The Catesby family lived here for six generations. One was fined a thousand marks for harbouring a Jesuit. The son was the conspirator, who is said to have sold Chastleton to obtain gunpowder for the Gunpowder Plot. But as a matter of fact the estate had gone from him in the last year of Elizabeth's reign. After Essex revoked he had no settled abode. Other families are the Ancestes, who lived at Brookend, and the Greenwoods. More recent families connected with the place are Biggs, Fothergill, Halifax, Jones. Icomb is undoubtedly a British name. It was formerly more extensive than it now is, and included in the coombes were Coombe Baskerville and Westcote. From a record dated 1065 it has been supposed that the whole of Steccacombe in the time of King Harold belonged to the prior and convent of Worcester, and that afterwards they were deprived of the Gloucestershire portion, in which Icomb Place is described as being during the Norman invasion. Durandus, Sheriff of Gloucester, had this place at the time of the Conquest. That some person of wealth and piety lived here in the time of Henry III. might be inferred from the style of the Lady Chapel in the church, which is part and parcel of this place. In the reign of Edward II. crops up a family whose chief, in pursuance of the prevalent custom of those early times, assumed as a surname the name of the place of his abode. The place is now a shell, but it is a relic without a rival in the county. Respecting the architecture much perplexity prevails. Mr. Royce proceeded to give a detailed description of Icomb Place, among other details noticing a fine table whereat might have sat Sir John Baskerville telling of Agincourt, one of the owners of the place having been there. In one part of the building some supposed there had been a chapel, but others demurred to this view. He pointed out the position this was supposed to have occupied, and also other apartments in the building. There was a good window, of three lights, in the east wall, well moulded, like the window below. If this was admitted to be the window of the chapel, it might have contained a small oratory, or kind of family pew. One of the Cope family, connected with this place, is made in his effigy to give forth this maxim:—"Let others learn to live; there's nothing I esteem worth learning but the way to die."

The buildings mentioned in the programme were visited with the assistance of Mr. J. E. K. Cutts, Mr. Wits, Mr. Williams, Mr. Middleton, and Mr. Waller. The concluding meeting was held in St. Edward's Hall, when it was decided to meet next year at Bath. This report has been taken from the *Gloucestershire Chronicle*.

#### SCOTTISH SOCIETY OF ARTS.

AT the meeting of the Royal Scottish Society of Arts on Monday the reports on the papers read during the session were submitted. On Mr. Wilkins' mode of preventing loss by fire, and on his improved fire-proof doors and shutters, the committee reported favourably, remarking, however, in regard to the suggestion that trained firemen should be in constant attendance during each performance in theatres, that, although admirable in point of principle, it would, except in large and paying theatres become an item of expense that might be objected to by proprietors. Mr. Benjamin Aitken, foreman smith at St. Margaret's Works, read a paper on "The Welding of Cast Steel." The ordinary method, he remarked, of welding cast steel was to heat it a very little more than blood red; if heated much above that it would break off or crumble away, and thus become useless. In welding cast steel they must have some "flux" that would have an ameliorating influence on the steel, and allow it to be heated up to a welding heat, and at the same time retain its form and quality. After alluding to various compositions used for this purpose, including Drake's, which was sold at some 35*s.* per cwt., he said it had been discovered that stucco, which sold at 3*s.* 6*d.* per cwt., answered the purpose admirably. In using it they must be careful not to let the steel be too highly heated before applying the stucco, and always be careful to form the flux as early as possible. He had found that by this method steel not only retained but in many instances improved its quality. Several examples of steel welded in the manner described were produced, and a committee was appointed to report on the paper.

#### THE UNIVERSITY BUILDINGS, EDINBURGH.

AN address was delivered on Tuesday to the graduates in medicine of the University of Edinburgh by Professor Frazer, in which he referred to the difference in the arrangements between the new and the old buildings. He said:—

The methods of study have been transformed and a new era has been entered upon whose characteristics will be retained for many years, and probably during the remainder of its existence. This era is that of observation and experiment, the methods of all true science; of investigation of the sciences concerned with life, carried on independently of any immediate bearings upon the healing art. In every centre of medical education the distinguishing stamp of this era is to be seen. In our own University, the construction and arrangements of the new buildings show that it

has been amply recognised. In the older buildings the distinguishing features are large lecture-rooms, with miserable laboratories, imperfectly lighted, and only to be reached by arduous climbing of steep staircases. In the new buildings, palatial ranges of laboratories, well lighted, perfectly ventilated and heated, and luxuriously fitted with apparatus for work, have attached to them lecture-halls which constitute appendages to the laboratories rather than the main features of the buildings. Investigation and practical work are amply provided for, so far as space constitutes a provision; and if in some departments the lecture-rooms seem to afford but straitened accommodation, it is either mainly a defect which contrast with the vistas of roomy laboratories suggests to the morbidly disaffected, or it is a result of the appreciation, greater than could have been anticipated, of those who desire to be educated for our profession. If this scheme be completed in the perfect manner in which it has been designed and partly carried into effect, and if a generous public will endow the University with the increased pecuniary resources which the necessities of the changed conditions demand, medical education and research will be enabled to maintain in Edinburgh the leading position they have for generations occupied.

### THE LATE MR. J. C. WINTOUR, A.R.S.A.

THIS artist died on Saturday last. He had not reached his fifty-seventh year. The *Scotsman* says that Mr. Wintour was well known for the last thirty years to the frequenters of the annual exhibitions of the Royal Scottish Academy as a landscape painter, whose ultimate performance has never quite made good his early promise. Mr. Wintour has been for two or three years past in a failing state of health. A native of Edinburgh, the deceased painter received his education in art at the Trustees' Academy, then under the charge of the late Sir William Allan. Devoting himself to landscape painting, he soon attracted attention in the galleries of the Royal Scottish Academy with work of careful finish, which at the same time displayed true feeling for nature and an eye for rich, harmonious colour. Year after year he continued an exhibitor—not unfrequently a liberal one—his pictures gaining in breadth, and showing more and more the predilections of a colourist who had keen appreciation of the silvery charm of sunlight and the magical play of atmosphere. His landscapes also bespoke a certain happy skill in composition; and the rare tact with which figures were often introduced constituted an additional attraction. From time to time their merit was recognised by the Association for Promoting the Fine Arts, who purchased, among other examples, an excellent picture of *Minnow Fishers*, exhibited in 1860. In 1859 Mr. Wintour was admitted to the outer circle of the Royal Scottish Academy; and for some years afterwards he continued to produce landscapes which formed an interesting feature of the Exhibitions, dealing, as they did, like those which had gone before, with varied aspects of Northern scenery, from the shady woodland nook to such extensive prospects as one commands from the top of Moncrieff Hill. Gradually, however, he fell into a vague, not to say sloppy manner of painting; and latterly his work, though retaining not a little of the old charm in colour, lighting, and composition, has not been quite worthy of the reputation gained in more laborious days. He will be remembered for the productions of his vigorous youth, rather than those of what should have been his full-fledged maturity.

#### Mr. Burges' Advice.

SIR,—The advice given by the late William Burges "in a letter to a young architect," printed in your current number, is as surprising as it is humorous.

The letter in question is addressed, not to a boy-student, but to one who is reminded by his counsellor that he has "passed his apprenticeship, done his Academy, and finished his Continental tour." He has, in fact, thus, at some 26 or 28 years, say, become a qualified architect, as such qualification goes, and is, perhaps, as completely beyond "measurable distance" of being an artist as he can well be.

It was to such an one, a short time since, in a discussion following upon the reading of a paper "On Colour" by Mr. Geo. Aitchison, A.R.A., before the Architectural Association, that Mr. Riddett, the chairman of the occasion, naively remarked that "the young architect would do well to make the subject of colour in decoration a study, for the public taste was advancing, and architects were more likely to be called upon to execute such work." From the pen of the late William Burges we have now similar words of admonition for the guidance of the young architect. He is, in this instance, solemnly counselled to "learn to draw the

figure;" and, moreover, he is assured, with unconscious irony, that "a knowledge of the figure is the foundation of all good taste in art."

The soundness of the latter dictum is beyond dispute. Hard, though, will it appear to the young architect at such a moment to be told thus authoritatively, while fondly imagining that it was the capstone only that was needed to complete the structure of his professional education, that something has gone radically wrong with it from its very foundation.

Nothing can be more misleading and cruel than to induce young architects to imagine for a moment that the artistic gift of form or colour can be acquired by recipe in this way.

The very fact that as men they have had to learn architecture as a profession, instead of being stirred by early impulses to express themselves in colour or form, should be a matter of wholesome, if serious, significance to them on the point.

William Burges came by his powers of figure-draughtsmanship under diametrically opposite circumstances; so entirely so, indeed, that it is difficult to understand how he, in instructing others, could so overlook the teachings of his own experience. He had not studied on an impossible programme, aiming to be an architect first, an artist afterwards. Burges was artistic in his teens. Before he had devoted to architecture a serious thought, he had worked in the antique and life schools, side by side with many young painters and sculptors who have since become famous.

He had, by gift of nature, a feeling for form, upon which basis alone can figure-drawing worth talking about become possible. In other words, the ultimate mastery to draw the figure, and to know it is, like the creative power in colour, but the development of an instinct which is inherent from birth. If this faculty is not in the student, nothing will ever put it there. As well might it be attempted to educate a man unconscious of tune in the art of musical composition.

And as to "colour"! It is self-evident from his remarks on this subject that Mr. Riddett fully shares the confusion of mind common to professional architects when dealing with the art side of architecture. It has not occurred to him that the man who has lived long enough to become a young architect, and as such is so lacking in spontaneity of feeling for colour as to require, thus late in the day, to be urged, in professional interests, to take it up as a study, may rest assured that as colour did not take him up long ago, nature is against him; and that, thus hopelessly handicapped, he may, in mercy, be recommended to avoid altogether a subject in which he might become artistically "dangerous to himself and others."

I am, Sir, yours faithfully,

A STUDENT OF NATURE.

### REVIEWS.

THE IMPERIAL DICTIONARY OF THE ENGLISH LANGUAGE. By JOHN OGILVIE, LL.D. New Edition. Edited by Charles Annandale, M.A. Vol. III. Blackie & Son.

The volumes of Messrs. Blackie's Dictionary appear with the punctuality of a daily paper or a monthly magazine, although each contains eight hundred closely-packed pages. It is difficult to estimate the gain to popular education by the circulation of a work of this kind. A dictionary like the "Imperial" has a better claim than a newspaper to be called "a map of busy life, its fluctuations, and its vast concerns," and any one who reflects on the myriad subjects to which it relates, can hardly fail to have his mind expanded. Universal knowledge is beyond the attainment of the most attentive student; but he can at least from a good dictionary obtain a glimpse of what is knowable, and this is no mean advantage. The tendency of the book is to promote precision of thought. Wherever practicable the illustrations refer to special examples, and the architectural sketches are taken from existing buildings. In one column we find a doorway from Earls Barton, a window from Steetley, and arches from Norwich, although for many readers general types of Norman arches would serve equally well. It is said that Lord Chatham was in the habit of drawing inspiration for one of his great harangues from the pages of Nicholas Bailey's old-fashioned dictionary; but how much more definite, as well as more abundant, are the ideas which a good modern dictionary can suggest to an orator or a writer. No one need complain of a want of comprehensiveness in the "Imperial." Another feature that gives interest to the new edition is the etymology. Dr. Ogilvie was one of the old school, and was so ingenious in tracing words to a single source as to suggest kinship with the man who maintained that Gaelic was the language spoken in Paradise. Mr. Annandale takes a broader view, and does not hesitate to introduce two or more roots for a word whenever there is uncertainty. According to Dr. Johnson, a lexicographer is a harmless drudge, who busies himself in tracing the origin and detailing the signification of words; but the man who by his vagaries puts students on a false track is anything but harmless, and fanciful etymology is almost as bad as the genealogies of pedigree-makers. One of the advantages of the "Imperial Dictionary" is that the editor does not seek to gain a reputation by startling discoveries of the relationships of English words. He is an advocate of what Boswell called "the learned yet judicious

research of etymology." One example of this discretion is all that we can refer to. It is the carpenter's word "rabbet." Dr. Johnson derived it from the French "rabatre," to abate, or "raboter," to plane, and he defines the noun as a joint made by paring two pieces of wood so that they wrap over one another. Cobbett, who had much of the arrogance of self-educated men, seized on this word to show his mastery of French and his superiority to Johnson. "If the Doctor," he wrote, "had known French only tolerably well, he would have known that *rabot* is a carpenter's plane, that *raboter* is to plane wood with a carpenter's plane, and that boards fitted together by means of the plane, and not by means of the saw, the chisel, or other tools, are boards *rabotés*, or in English, raboted. How plain is all this, and how clear it is that we have got a piece of nonsense in our language because Dr. Johnson did not know French." It was characteristic of Cobbett to ignore the fact that Johnson did give *raboter* as a probable root for the word. But, in spite of Cobbett, it is by no means certain that our English rabbet or rebate has been derived from *rabot*. In making the joint, although the plane may be necessary, it does not strike one as being the chief, the indispensable tool, and accordingly we are inclined to believe that some other root must be found for the word which will be more suggestive of cutting. Ship carpenters call the angular recess *cut* into the sides of the keel to receive the planks the rabbet of the keel, and the word is used for joints where the wood has not been planed. In the "Imperial Dictionary" we find "raboter" given as the root, but "aboutier," to abut, is also suggested, and the latter is more plausible. We must say, however, that in no dictionary have we found a root for rabbet which appears convincing. If a French original must be sought, "rabouter," to piece, is preferable to "raboter," to plane; but it is more likely that rabbet is a provincial English word, or a corruption of one. In the "Glossary of Architecture" the root is said to be "rebattre," but as that means to repeat or to renew a beating (*battre de nouveau, répéter inutilement*), its relation to the English word is not manifest.

THE ACTION OF LIGHTNING, AND THE MEANS OF DEFENDING LIFE AND PROPERTY FROM ITS EFFECTS. By ARTHUR PARNELL, R.E. Crosby Lockwood & Co.

There is a temptation when treating of the effects of lightning to become sensational, and to exaggerate danger. But although the author of this book brings together a remarkable series of recorded facts and opinions, it cannot be said that he is a panic-monger. Like many enquirers in modern times on other subjects, he is opposed to the *laissez faire* policy, and suggests that the Government should undertake precautions to secure certain districts. He would have places where there were explosions indicated by some kind of marks. Many recommendations are given with regard to the construction of buildings, and to ensure safety it appears to be necessary to avoid metal-work on the outside, except in positions close to the ground, to use tiles in preference to slates, finials of stone instead of metal, eave-gutters of stone, concrete, or terra-cotta, chimney-pots of earthenware or terra-cotta, flat roofs covered with asphalt, &c. Clocks are not to be set high up, and stained-glass windows are to be without wire guards. The book deserves attention, and should be studied in connection with the report prepared by the Meteorological Society.

MODERN METROLOGY: A Manual of the Metrical Units, and Systems of the Nineteenth Century. By LOWIS D'A. JACKSON, C.E. (Crosby Lockwood & Co.)

Although a prejudice still exists against the adoption of the metrical system in this country, there is no doubt that it is less violent than it was when the alteration was first proposed. In all cases where the system has been tried it is found to be advantageous and to entail no inconvenience. It is, for example, easier to plot engineering surveys on a scale of a hundred or two hundred feet to an inch than on a scale of two or three standard chains. In dealing with measures of weight and capacity a similar result is seen, and as regards calculations of money the superiority of the metrical system is apparent if we contrast the difficulty with which a foreigner understands English accounts and the ease with which an Englishman masters those made out on the Continent. The isolation of England is evident from a glance at Mr. Jackson's book. It is a universal book of tables, and must have taken enormous labour in its preparation, and, like all the author's books, is marked by accuracy. Mr. Jackson has also given a set of metrical tables which he proposes for the assimilation of the present measures. The book is a convincing argument in favour of the adoption of the decimal system.

DANTE GABRIEL ROSSETTI: HIS WORK AND INFLUENCE. By WILLIAM TIREBUCK. Elliot Stock.

It is perhaps too soon to form an estimate of the work of the late Dante Rossetti, or of his influence. His pictures have been for many a year "caviare to the general," and although admiration of them is now less rarely expressed, we have yet to discover how far it is sincere and enduring. An age which at one time is

delighted with the productions of Mr. Frith, and at another time professes to be moved by flaccid imitations of Botticelli, cannot have stable principles in art. That Mr. Rossetti had his worshippers is well known, but it is generally found that influence like his rarely lasts when the earth is over the idol. Nor would there be much loss to the world if the cultus were now ended. Mr. Rossetti was, we have not the least doubt, sincere enough in his painting and poetry, and if there is little which is healthy about his works, they are the more expressive of a man who was ill at ease in body and mind. He was out of place and out of time, a resurrectionist mediævalist who might have been happy in Florence six centuries ago. But the dissatisfaction which was natural in him is ridiculous in his English imitators. "When I was in France," says Prince Arthur, "young gentlemen would be as sad as night only for wantonness;" but in our time it is not only the young folks, but substantial men and women, standing well with their bankers, and not troubled with dyspepsia or insomnia, who have made the discovery that "life showeth grim and bare." People judge of a master from his disciples, and there must be remarkable vitality in Mr. Rossetti's system if it can survive after so many of his friends doing their utmost to bring ridicule upon it.

Mr. Tirebuck appears to be one of those worshippers who fashion an imaginary Rossetti, and fall down before their own creation. The Grand Lama of Thibet is as nothing if compared with the new "teacher-jewel." "We would have had him patriarchal," says Mr. Tirebuck, "with the chants of continents to sooth the inevitably waning days. Remembering his devotion and labour, we would have had"—but here Mr. Tirebuck appears to have been confounded with the visions that arose before him, and the uninitiated can never know what was the fate awaiting poor Mr. Rossetti if his worshippers had their own way. Destiny was too much for them—"he went to the open to breathe its air, but the air, like a breath, inhaled his life away." It is not difficult to imagine how a man who shrank from the public gaze, and who had an Italian's sense of the ridiculous, would wince under admiration of this kind. "The pleasure which many of his worshippers experience in his work," says Mr. Tirebuck, "is only half of something they actually know, the other half being concealed, like the rose in its bud, within the possibility of their natures, and which they feel in a far-off mystic way not definite enough to be worded." But what a blessing it would be if not only the half, but the whole of the "something" remained unexpressed—if, in short, some dumb worshippers of the artist could be discovered! It is possible to be made more ridiculous by words than by perforations of D.G.R. on brass fire grates; and whenever Mr. Tirebuck attains reverence for the memory of the man whom he calls "a surviving plenipotentiary of early Italian feeling presenting credentials to British Common Sense," he will regret his precipitancy in publishing his essay.

## GENERAL.

Messrs. J. and T. Tillman have been appointed architects for the erection of the New Sunderland and Durham County Institute for the Blind, which is to be built in Villiers Street, Sunderland.

Messrs. Robert Boyle & Sons have been awarded the Gold Medal (highest prize) for their system of ventilation for buildings and ships, at the International Exhibition of Means and Appliances for the Protection and Preservation of Human Life.

Sir Rutherford Alcock, K.C.B., has accepted the presidency of the Health Department at the forthcoming Congress of the Social Science Association at Nottingham.

An Exhibition of Industry and Art was opened in Trieste on Tuesday by the Archduke Charles Louis. The building covers an area of 21,500 square yards.

A Bill has passed authorising the construction of water-works at Newquay. At present the inhabitants depend for supply upon a few wells. The works are undertaken by a company.

The Waterworks for the mansion in course of erection for the Marquis of Bute at Mount Stewart will soon be commenced. The water is to be conveyed from a reservoir at New Farm, which is about a mile distant.

A Brass Lectern has been presented to the Borough Asylum, Birmingham, as a memorial of the late Medical Superintendent. It was made by Messrs. Jones & Willis.

The St. Pancras Workhouse Competition.—A meeting of the Guardians was held on July 27, when the report of Mr. A. Cates on the designs for the proposed workhouse was brought up. He considered that the plans of Messrs. Young & Hall, and of Mr. H. H. Bridgman complied with the requirements of the Local Government Board. Nine guardians voted for the acceptance of Mr. Bridgman's designs, and seven for Messrs. Young & Hall's. Mr. Bridgman was accordingly declared to be elected architect for the new buildings, subject to the approval of his plans by the Local Government Board. The buildings are likely to cost over 100,000/.

# The Architect.

## THE INSTITUTE OF ARCHITECTS ON ANCIENT LIGHTS.

**A**FTER the long process of incubation which now seems to be essential to any demonstration on the part of the Institute of Architects—except when it is a mere splenetic assault upon impregnable authority—there has just been issued what is called a “preliminary report” by a committee which was specially appointed by

the Council about a year and a half ago on the *questio vexata* of the law of ancient lights. It is a somewhat lengthy, and indeed a carefully-prepared document; but as it consists almost entirely of opinions expressed by members of the committee in their personal and individual capacity, it lacks cohesion, and indeed cohesiveness. Some of the opinions, as might be expected, are worthy of attention; but as a whole the argument is unprofitable, and the probability of its making any public or even private impression is small. The gentlemen whose notions—we might say emotions in some cases—are thus laid before the world are Messrs. WHICHCORD, CATES, SOMERS CLARKE (the late), CLIFTON, and HAYTER LEWIS; Messrs. DARLEY, HARRISON, Q.C., and LOCOCK WEBB, Q.C.; and Mr. LEYBOURN GODDARD supplies an appended report on the history of the legal question.

Of these, the four lawyers, as would be supposed, occupy themselves with a dry and timid exposition of the law; the five architects with more or less bold and lively statements of their sense of the injustice of that law, and of the amendments which they themselves respectively, were they CÆSAR, would summarily introduce. As is usual in building affairs, the exposition of the lawyers turns out to be little else than theoretical speculation on words which represent mere figments of business; while the architects’ wail of practical distress is founded at the best upon a very hazy conception of the genius of the law.

Now the law of England, as the highest authorities have frequently and earnestly averred, is the perfection of human, and indeed of divine justice. There is an element in it which is facetiously called its “glorious uncertainty,” by virtue of which mortal man may never predict the result of a suit—except that ruinous costs must be paid; but every one is supposed to know the law in so far as his personal responsibility is concerned, and if no one except a lawyer is allowed to profess the slightest knowledge of it when anything comes in practice to the push, and indeed even a lawyer must do so with fear and trembling, this is what cannot be helped. It is not to be wondered at, therefore, that the law of such a thing as ancient lights should not be “understood of the people” generally; nor of the architectural order of the people specially;—nor even of the legal order itself—with reverence be it said. In fact, if any one who has acquired, by sad experience in the Courts of Justice, a sort of appreciation of the way in which this chapter of law and some others are found experimentally to work, were invited to name a subject with regard to which more than all else the rule is confusion worse confounded, he might fairly be at a loss to put any subject whatever in even momentary competition with that of “ancient lights,” or, as the alternative phrase goes, still more suggestively of chaotic darkness and stagnation, “light and air.”

To explain to the general architectural or building reader the whole question of “ancient lights” in a few familiar words is nevertheless, strange to say, a comparatively easy task. England being “the paradise of vested interests,” every window which is sufficiently old to have a vested interest in being lighted over a neighbouring property is held entitled to have that lighting respected for ever as an easement, and the owner of the neighbouring property must not (by building, for instance) obstruct it. With the title to the access of light there is a similar title to the access of air; but this point is much more difficult of explanation, and is, for the moment, scarcely worth explaining.

The interpretation, however of this principle of law—or

practically of justice and good neighbourhood between owner and owner in towns where natural lighting and ventilation are so frequently matters of difficulty—is by no means so simple a thing as the simplicity of the proposition we have stated would seem to imply. Owners themselves are found to be extremely exacting, and this in one direction just as much as in the other. They, however, being obliged to yield to professional advice, it is architects and lawyers who have to manage the matter. Concerning the architects, it is almost enough to say candidly that none of them, except a handful of accidental experts, have happened to devote any real attention to the subject. Concerning the lawyers the same statement may be made; and none of them will take offence when we say so, as many of the architects may perhaps be disposed to do. Even in the Courts, after the most elaborate examination of witnesses and the keenest argument of counsel, it seems to be generally almost impossible for the judge himself to arrive at a decision except upon some false issue. The only explanation of such a state of things that can be offered with due respect for authority is that lawyers cannot understand the practice of building while builders cannot understand the practice of law. It is well known, and indeed fully acknowledged, that in building questions more than anything else the legal mind finds itself peculiarly at fault; and if it happens that in building questions of this particular kind the incertitude is of the greatest, it is because the technicality is the most subtle in both law and building. The circumstance that law can only deal with abstractions, while in building there are no abstractions, seems to be here more notably exemplified than usual.

If we come, then, to the real issue, the point which has always to be decided in any dispute about ancient lights is the *materiality* of the obstruction. The window in question (being twenty years old) has acquired, according to English principles, an absolute right to the easement of lighting. The neighbouring owner has, of course, a right to build on his land; but he must so build, therefore, as not to obstruct or obscure the lighting of this window. On the other hand, any obscuration complained of must be not merely mathematical or fanciful or imaginary, but practical and substantial—of such a nature and degree, in other words, as to interfere “materially” with the convenience of occupation of the room which is lighted.

There are two points, therefore, open to discussion by such a committee as that which the Council of the Institute has appointed. The first is whether the right acquired by the window through long enjoyment is a just right—that is, a matter of really necessary rule in the interest of the public all round. The second is whether the mode of procedure by which the courts of law arrive at a conclusion as regards the measure of damage is the proper mode.

To inquire into the justice of the legal principle is probably hopeless; we can scarcely expect to obtain even the slightest change of the law; the doctrine of easements as direct property is too firmly established in England to admit of an exception of this kind being made; and even what little could possibly be attempted in the desired direction would have to be restricted, be it observed, to future easements, leaving quite undisturbed the property in those that already exist. But it is another thing altogether to examine and criticise the processes of litigation; and here no doubt something serviceable might be done if the committee as a body should happen to be competent to do it.

But when we find such a man as Mr. WHICHCORD, who is a thoroughly practical surveyor, bringing forward as his personal contribution nothing but the proposal that what is known as the old-fashioned and obsolete rule of the angle of 45 degrees should be made “a general law” by statute, the difficulty of accomplishing anything becomes at once apparent. “To my mind,” says he, professing to rely upon a certain case known as *HACKETT v. BAISS*, “the preservation of the incidence of light and air to an ancient aperture at an angle of 45 degrees, *both directly and laterally*, would be a good law of universal application.” But why? Mr. WHICHCORD does not say why; except that the MASTER OF THE ROLLS acknowledges the principle. But, as matter of fact, all that the MASTER OF THE ROLLS said in *HACKETT v. BAISS* was that, inasmuch as he found some sort of rule of municipal regulation extant whereby, at least in the metropolis and in ordinary circumstances, the height of a new row of houses is not allowed to exceed the width of the street, he should say that in a commonplace street about 35 feet wide the houses might reasonably be confined to about 35 feet high in the walls, with a moderate addition for roof and chimneys. On a subsequent occasion this eminent judge had

to explain himself further, in consequence of his principle having been openly challenged and repudiated in another Court; and he then expressly said that he never would have permitted himself to lay down any hard and fast rule of 45 degrees or any other angle; so that, when he was invited to apply his supposed rule to the case of a back-yard, he positively refused to acknowledge it. We mention this, not to raise any discussion on the merits, but merely to show how difficult it is, even for such an expert as Mr. WHICHORD, to deal with the introduction of any hard and fast line of law, however simple it may be. Mr. CLIFTON, again, an equally sound and experienced practical man, can only suggest this:—"I would strictly define the height to which buildings may be carried in all streets, having regard to their width; and also the height in back-yards; and this to be applicable to the whole kingdom." It would be impossible.

It is said that the lawyers abhor science; but how far such proposals as these on the part of architects recognise science with any effect we need not say. If an Englishman's window is to be the window of his castle, it is not by such rules that it can be protected or its protection restricted. The grievance would be changed in character, but the amount of complaint would remain the same. We recommend the Institute committee to go into the matter much more intelligently, if not carefully, than they seem inclined to do. Accepting the English law of easements as being unquestionably intended in theory to do justice between man and man in this matter, it becomes the function of the expert architect to apply the principle of that law justly in practice. It is idle to cry out that this cannot be done. It is equally idle to call for special legislation; nothing of the sort is needed, if the architects will but do their duty. It is still more vain to demand the establishment of hard and fast rules; every case must rest on its own merits, in this as in all other branches of law. The first question for investigation by a committee of architects is *how to measure the damage*, and this is the very point that the Institute report does not attempt to touch. If, as a second question, they ask *how far compensation can be made to take the place of prohibition, as a custom of the Courts*, this is perhaps as far as they can go.

One thing, however, the committee, somewhat characteristically, forget to mention. When "extortion" is practised—as it no doubt only too often is in questions of this kind—who "gets up the case?" An architect. On the other hand, when a flagrant defiance of the law is attempted, who is the promoter? An architect. When a fine building is ruthlessly shaved off to a horrible angle, who does it but a brother architect? It is useless to cast the discredit upon the lawyers; their work is but ministerial; it is the architect whose opinion puts them in motion; and if we say that the responsibility for all the wrong of which architects so bitterly complain rests upon architects, this is too plainly the fact to be disputed for a moment. It might not be amiss, indeed, if the Institute Committee were at first to confine their attention to this one point alone, even as a question of discipline.

### SHORING AND UNDERPINNING.\*

MOST of the shoring which is carried out in London (and in no city in the world is there more of that kind of work) may be described as empirical construction. The men who undertake it know or care little about the statical problems which are involved when houses are kept from collapsing by means of strong timbers so arranged as to be as much as possible in compression. But it must be allowed that in this class of construction experience counts for much, and it rarely happens that the shores are found to be insufficient. It is, however, prudent that the propping of dangerous structures should be conducted under the authority of architects, and questions on the subject now form a part of the programme of the Institute examinations. A man who was possessed of much experience in practical building would of course find no difficulty in arranging timbers so as to give security to a weak wall, although he might not have before given a thought to the subject. But there are many students who are not in that position, and it is for them that Mr. Stock has prepared his book. It is not a large book, and consequently cannot

contain descriptions of every work of shoring and underpinning, but enough examples are given to enable a student to be prepared for the examiner's questions, and, what is more important, to be qualified to direct workmen in dealing with a dangerous structure.

The theory of shoring is simple enough. To keep a wall from bulging too far common-sense would dictate the placing of a piece of timber vertically against the wall, with an inclined prop or shore fixed in the ground to take the thrust. In London the inclination of the prop has very often to be determined by public convenience, or, in other words, the base of the triangle formed by the wall, ground, and prop has to be narrowed as much as safety will allow. If several shores or props are requisite they must be well within the base, and of course they are gathered as closely as possible together at the foot. If, in addition, provision be made by means of cross struts to prevent the shores from bending or buckling under the thrust, then we may be said to have the metropolitan raking shore. A complete shore can be considered as a truss (or rather a cantilever), in which the thrust resulting from the house as a load is conveyed to a sole plate which represents the abutment. It is plainly an advantage that the shores should be subjected to as little cross strain as possible, and that no timber should have more than its proper share of force to withstand. To ensure this, care has to be taken with the form and position of the needles above, and with the inclination of the sole-plate below. It is in these details that the advantage of experience is seen. If it is found to be economical in mining to employ special workmen for the timbering, although nothing can be simpler than the props, headpieces, and cribbing, the same rule should hold in regard to the fitting and placing of shoring timbers. The dimensions of shores can be arrived at by calculation, but the gain would hardly be worth the trouble. Mr. Stock has been able to secure the co-operation of the contractors for the shoring executed by the Metropolitan Board of Works, and the following table of dimensions, which we suppose is taken from their practice, will be considered more trustworthy than the figures of a mathematician:—

#### Raking Shores.

For walls from—

15 feet to 30 feet high,	two shores are necessary in each system.
30 " 40 " "	three " " "
40 feet and upwards,	four " " "

Taking the angle of the shore at 60° to 75°:—

For walls from—

15 ft. to 20 ft. high,	4 in. by 4 in. or 5 in. by 5 in. may be the scantling	for each shore.
20 " 30 " "	9 " 4½ " 6 " 6 "	
30 " 35 " "	7 " 7 " 6 " 6 "	
35 " 40 " "	6 " 12 " 8 " 8 "	
40 " 50 " "	9 " 9 " 8 " 8 "	
50 and upwards,	12 " 9 " 8 " 8 "	

The system of shores should not, if possible, be more than from 12 feet to 15 feet apart; but if they are placed nearer to each other than this, the scantlings may be made lighter, which will be of great advantage in the case of a really dangerous structure.

A kind of shore much used in London is the horizontal or flying shore between two houses, consisting mainly of a horizontal strut strengthened by raking struts. The length for the horizontal timber should not exceed 33 feet. It is supposed by many people in London that there is a sort of Common Law right to make use of a neighbour's house for flying shores: that this right has limitations is suggested by a paragraph in Mr. Stock's book:—

It may sometimes happen [he says] that when it would be more convenient and economical to support a house with flying-shores, an objection is raised by the owner of the house (which it is proposed to use as an abutment, either because he is afraid of his wall being pushed in by the pressure brought to bear upon it, or because the unsightly appearance of the shores may be prejudicial to his premises. This objection he has a perfect right to make, and he can compel his neighbours—of course, at his own risk—to tie on the wall from the back, or, if there is room on their property for the erection of raking-shores, to adopt this method of supporting the wall. There is an instance of a kind on the Thames Embankment opposite the Temple station of the District Railway, where, although the wall of the house which requires support is over 60 feet high, and there is an admirable abutment for flying-shores close at hand, yet the more expensive method of raking-shores has been adopted, no doubt because the adjoining owner has objected to have his premises disfigured, as they certainly would be, by flying-shores butting against them.

\* "A Treatise on Shoring and Underpinning." By Cecil Haden Stock. London: B. T. Batsford.

There is an excellent chapter in Mr. Stock's book on Needle-shoring and Underpinning. The author recommends that in some cases trenches should be cut in order to allow of an examination of the foundations. The enormous expense which may sometimes be entailed by underpinning is shown by the outlay on the church in Moorfields. The Metropolitan Railway Company, to escape opposition before a Parliamentary Committee, undertook to provide against all contingencies, and we believe more money was expended on the substructure than would have been required to erect a new building. In the restoration of mediæval churches it is sometimes necessary to have recourse to elaborate shoring and underpins. A few suggestions on the subject have been given by Sir GILBERT SCOTT in his autobiography, and as they are derived from his own experience, are worth reprinting here:—

I. Be assured that no amount of shoring can be too much for safety, no foundations to your shoring too strong, and no principles of constructing it too well considered. II. Use the hardest stone for your new work which you can procure, and spare no pains in bonding it and tying it together with copper. III. Be very slow in your operations, excepting at critical junctures, when the very contrary is necessary; be careful in your principle of movable supports as you cut away old work; set every stone in the very best cement and run in the core with grout of the same material. IV. Key up well at the top and leave your shoring a long time after the work is done, and then remove it with the greatest care. V. (though more properly first). Tie your tower well together before you begin, and take special care of your foundations. Above all, have a thoroughly practical clerk of works, neither too young nor too old. The shoring must be all of undivided timbers, and often of four or more such balks bound and bolted together into one by irons.

Sir GILBERT SCOTT was too busy to be able to publish the details of the underpinning which he directed—although from a speech in which he describes the work at St. Mary's, Stafford, it is evident that he was engaged with some interesting examples. The most elaborate account of shoring and underpinning a mediæval church in this country is to be found in a paper read by Mr. J. P. SEDDON at the Institute in 1873, in which he described the operations at the parish church of Grosmont, in the diocese of Llandaff. The paper and illustrations have been reprinted by Mr. Stock, and form one of the most interesting parts of his book. In this case there was no excessive amount of timber employed, and the success of the experiment depended more upon skill than upon the inertia of a mass of material. In the arches the shoring was of two classes, the lower up to springing being a sort of tressel, while the upper part resembled ordinary centring, care being taken in the arrangement to bring the upper timbers over those on the lower part. The pieces were as carefully tenoned as if they formed part of a permanent structure, and it was found to be economical to have three sides of the timber sawn square in order to facilitate the framing of them together. The shoring in this case was an example of scientific construction, and at a moderate expenditure of money a most important building was saved from destruction. Considering what was practicable at Grosmont with a small outlay, and in the case of some of the English cathedrals, the necessity of expending 32,220*l.* on the shoring and underpinning of the tower of Bayeux is not apparent. M. VIOLETT LE DUC considered that it would be cheaper to take down the tower and rebuild it from the foundations than to adopt M. FLACHAT'S colossal framing. In cases of this kind more value appears to be set upon the temporary structure itself than upon its office. Even Mr. Stock is not above a weakness of this kind, for he says that "nothing is more satisfactory than to see a shore well made, and those who design and construct in this art cannot help feeling in such a case a pang of regret when their handiwork is cleared away!" These words would, we imagine, express what was in M. FLACHAT'S mind when he devised the Bayeux shoring, but they would hardly be reciprocated by those who had to pay the cost of the work. We do not, however, blame Mr. Stock for thinking highly of shoring and underpinning. He has in his book endeavoured to elevate operations which many people regard as being fit only for labourers by demonstrating that a common shore is not without scientific interest. His book is so well done that we hope he may be encouraged to write many more volumes.

An Etching of the Volunteer Review in Edinburgh, by Mr. R. Anderson, A.R.S.A., has been published. The scene is sketched from the north slope of Arthur's Seat.

## THE BISHOP OF CARLISLE ON ARCHÆOLOGY.\*

AS it is impossible for an educated man to live in Italy without gaining a love of art, or to live in Switzerland or our own lake country without becoming somewhat enthusiastic about natural scenery, so it would seem to be next to impossible to live in an old country like England, especially in this part of it, without becoming more or less infected by a love of archæology.

To go no farther, take the city of Carlisle, "the local history" of which, as we have lately been told on high authority, "stands out beyond that of almost any other English city on the surface of English history." Such a city is in itself a temple of archæology; and though our complicated system of railways, and our grand new station, and our factory chimneys have done much to vindicate our claim to respect in the minds of those who see things from a modern standpoint, still, nothing can obliterate the interesting history of Carlisle; and as her castle, her cathedral, her conventual remains, and some portions of her walls still stand as grand archæological monuments, so also recent examination has added to our knowledge and brought to light new treasures. I may mention in passing the discovery of the remains of a wooden stockade of Roman date in various parts of the city, corroborating the notion that the old Roman town was fortified, not with a stone wall, but with wooden defences; of some beautiful bronze relics, notably, a bronze torque; and of a large monumental stone, now in the Carlisle museum. Besides which discoveries belonging to the Roman period, it is only right to add that the careful restorations which have been effected by the Dean and Chapter, under the skilful and careful direction of the late much-lamented George Edmund Street, have thrown light upon several points connected with the Cathedral and the Abbey.

Passing outside our ancient walls, we find monuments of the past of the highest interest—English, British, Roman—in profusion. I will venture to specify those which have produced the deepest impression upon my own mind.

In the first place, it is impossible to pass from village to village in Cumberland without having the condition of things during the days of border warfare brought home very clearly to the imagination. It is not so much the existence of houses of defence like Rose Castle and Naworth, and the fact that almost every house of any magnitude contains its ancient tower or peel, though now frequently disguised by modern improvements—not this so much as the fortress churches, which brings back vividly the pugnacious and unsettled condition of the country a few centuries ago. Such churches as those of Great Salkeld, of Dearham, of Newton Arlosh, of Burgh-by-Sands tell a strange archæological tale. Perhaps in some respects the church of Burgh-by-Sands is the most interesting of those which I have mentioned. I may add that the tale which this curious church tells is rendered more, rather than less, clear by a recent careful restoration. There you have the tower with its impregnable walls, the iron gate between it and the nave, the north aisle with its windows high above the ground, and with a western entrance commanded by an aperture in the impregnable tower, through which a small gun within the tower would pour forth its contents if necessary upon an attacking party with great comfort and sense of security to those who manned it. Altogether, these fortified churches tell a strange and interesting tale. One of the grounds upon which Henry VIII. was petitioned to spare the abbey church of Holme Cultram was that it was the only place of defence of the inhabitants against the marauding Scots.

But the interest which is connected with monuments of border warfare and records of early English and mediæval history appears to me almost to vanish by comparison with that which attaches to the relics of the Roman occupation. A man has no need to be a skilled archæologist in order to be carried away by thoughts suggested by the Roman wall. May I say, in a parenthesis, how welcome amongst us is the Roman wall's historian—much more welcome than the greatest of his name would have been in Carlisle in those days to which I have just referred? I will venture to assume that most of us are acquainted more or less with Dr. Bruce's magnificent volume; and, assuming this, I will say boldly that to my own mind no monument of the past in our island seems to be comparable in grandeur and intensity of interest with the Roman wall. The identification of the various stations by means of the "Notitia," the light thrown upon the wisdom and craft of the great nation by the employment of foreign troops so arranged as to guard against conspiracy, the military skill evinced in the formation of a continuous road guarded by the wall from bitter foes on one side and by the vallum from questionable friends on the other, the beauty of much of the masonry, now as good as when first built, the evidence of a large population living in luxury and refinement in a country now waste and wild—these and a hundred other points which present themselves to persons of ordinary intelligence, seem to bring home to the mind Roman days, Roman power, Roman cleverness, Roman luxury, in a way in which books without such illustration frequently fail to do. A visit which I was

\* A presidential address delivered at the meeting of the Royal Archæological Institute at Carlisle.

permitted to make a few years ago to Chesters, and a day spent under the auspices of Mr. Clayton and Dr. Bruce at Borcovicus and the neighbourhood, seemed to me almost sufficient to convert the most utilitarian admirer of the nineteenth century into a devout archæologist. It is a curious comment upon the transient character of some of man's greatest works, that the commonest record of the Roman wall down south should be found in the London advertisement of "Best Wallsend Coals!"

It would be wrong, however, to limit the testimony of the Roman occupation of this part of Britain to the great wall. Even without taking account of its principal treasure, this neighbourhood would be rich in Roman antiquities. Especially I may refer to the remarkable discovery of Roman altars made at Maryport in the year 1870. No less than seventeen were found within a circular area of about twenty yards in diameter. And it is a striking fact that they were almost beyond doubt carefully deposited where they were found; they seem to have been hidden on some critical occasion, in order to save them from desecration. If this be so, we may congratulate the Romans upon their success, for so I think that security for some sixteen centuries may properly be called. An altar of Vulcan, which Dr. Bruce pronounces to be almost, if not quite, unique in Britain, would seem to have been an unconscious prophecy of the West Cumberland iron trade.

It is devoutly to be hoped that the existence of the spirit of which the Royal Archæological Institute is a chief embodiment will be effective in saving from injury or destruction some of the Roman relics which it is not easy to preserve by any direct agency. Complaints have been made in recent years of injury done to the inscriptions on the Gelt rock; and the county history contains a record of an inscription in the quarries near Rose Castle, which has so completely disappeared that I can find upon the spot not even a tradition of its existence. It seems to me strange, though possibly some good reason may be assigned for the fact, that in the Bill "for the better protection of ancient monuments," introduced by the Lord Chancellor, and now before Parliament, the schedules contain nothing Roman.

It would be impossible, as it is unnecessary, to specify all the interesting marks of the Roman occupation and the relics of Roman civilisation which abound throughout the district; but I will just refer to the remains at Ravenglass, because recent excavations, which have discovered the hypocaust, have placed the ruins there existing upon a firm Roman basis, which I suppose they previously occupied only in the minds of experts.

Passing from Roman antiquities, I may congratulate archæologists upon the remarkable discovery of the sculptured stone with runic inscription at Brough under Stainmore, and upon the additional light lately thrown upon the well-known cross in the churchyard of Gosforth. Doubtless we shall hear something upon both these subjects before the Carlisle meeting comes to an end.

It is matter for perhaps more than local satisfaction, that all the recent discoveries to which I have referred, and many others, are duly chronicled in the "Transactions of the Cumberland and Westmoreland Antiquarian Society."

The archæological wealth of this district in reality constitutes a subject with which even an archæologist would find it difficult to deal in a short address. I, who am not an archæologist, shall feel content in bringing my survey to an end with a notice of something which has lately been done in this diocese, and of which I believe that the Institute will approve.

I refer to an examination which has been systematically made of the ancient church plate existing in the diocese. The results of the labour expended upon this work have been far more interesting and remunerative than was at all expected when the design was formed. I need not specify these results, because they have been recorded in a volume, which I believe is published almost at the same moment as that which is signalled by the visit to Carlisle of the Archæological Institute, and of which I trust that many members will purchase a copy. Besides this, I may mention that some of the most interesting specimens of plate will be exhibited in our temporary museum. Amongst these may be specified a beautiful mediæval chalice, which I am able to commend to your notice as being one of about a dozen specimens known at the present time to be in existence.

Might not the example of the diocese of Carlisle be followed with advantage elsewhere? I ask the question with all modesty, but I will not pause for a reply.

Instead of doing this, I will occupy your attention for a few minutes with some remarks of a more general kind than those which I have offered hitherto. The time has gone by in which archæology can be confounded with antiquarianism of the Monkbarns type. We recognise that archæology, being in reality the science of past time, is the basis of history, of politics, even in a certain sense of religion itself. The discovery of a coin or of an inscription leads not merely to the enrichment of a museum of curiosities, but perhaps to the settlement of some historical doubt, or even to the re-writing of some chapter of history. And even apart from historical and kindred studies, some knowledge of what may be called archæology would seem to be in our own days a necessary possession of every man—and I may add every woman—who lays claim to what may rightly be called a liberal education. Indeed, so far from archæology being a special possession for

which certain eccentric persons of Dryasdust proclivities may be regarded as holding a patent, it is not too much to say that every well-educated person is in some degree an archæologist, though, like M. Jourdain in the matter of speaking prose, he may not have been always aware of it.

Such a person goes into a picture gallery. He may not be an expert, but he will almost certainly have made himself acquainted with the leading facts connected with the early development of pictorial art in the Low Countries, in Germany, in Italy; he will know something of the names and histories and characters of the early masters, and of the schools which they founded; he will take an intelligent view of art, because he knows something of its history. Is not this archæology?

And I suppose that the same thing is true of music. Of course we may in a certain sense enjoy music without knowing anything about it, especially if the music in question has the simplicity of "Cherry Ripe" or the patriotic associations of "God Save the Queen"; but if we wish to go beyond the mere tickling of the ear and the ignorant expression of satisfaction at a pretty tune, we must know something of the early masters of sound, must have traced the growth of musical science, and so have become in a mild form musical archæologists.

This fact is perhaps realised more distinctly in the case of architecture than in that of any other art. Architecture without archæology is manifestly mere confusion. There is plenty of knowledge of course which still remains the property of the architectural expert; but the larger number of educated persons, on going into a building like our Cathedral, feel themselves at home with the different styles of arches and windows that it contains; they will not grossly confound one date with another, they will see at a glance the rough history of the building, and so far forth they will prove the existence in their minds of archæological knowledge.

May I give an amusing instance to show that in this respect improvement has been made in recent years?

In the course of your visit to Carlisle you will doubtless see the Fraternity. The recent restoration has brought into prominence the pulpit, in which in olden days the reader stood for the edification of the brethren at their meals. It would be difficult now to mistake the purpose of the pulpit; but till lately it was popularly known as "the Confessional," and in order to carry out this view the artist who has drawn the pulpit for "Billings' Illustrations of Carlisle Cathedral" has represented a woman kneeling on the floor below!

I have remarked already that archæology extends even to politics and religion; and this is indeed true. I do not know upon what principle men settle the colour of their politics, or whether they all adopt the same principle, or even whether it can be asserted that principle of any kind universally enters into politics; but I am sure that any one who would take an intelligent view of public affairs must not be content to regard the present condition of this country, and its constitution, and its mode of government as something which can be examined in the abstract, without reference to the complicated history upon which it rests, and out of which it has grown. A politician must have a grasp of history, and history is archæological or nothing.

Nor is there anything unreal in extending these remarks, as I have done by anticipation, to religion itself. The complicated relations of churches and sects, the justification or the condemnation of the position taken up by this or that religious body, the hopes or the fears connected with any apparently new but perhaps essentially old development of doctrine or practice—all these, and many like things, can be intelligently judged only by the man who has gone deeply into the stores of Christian antiquity, and qualified himself for forming an opinion upon the present by a careful and candid study of the past. A sound divine must have other qualifications; but he may not omit to make himself a sacred archæologist.

And what shall we say of science—at least, of some of its branches? Surely we may say this, that geology and the sciences allied to it have opened up a hyper-archæological chapter in the history of the world. The works of man carry us back into a very ancient past; here in this country we have magnificent remains of Roman civilisation, and those remains testify to a previous civilisation, if civilisation it is to be called, of which we have relics in our British mounds and monuments; and the ruins of Troy, and the wonderful monuments of Assyria and Egypt, not to mention other countries, carry us back to a period when Roman power was yet in the womb of time; and the recent evidences of prehistoric man carry us further still into the dim darkness of ancient days; but the geologist can smile at archæology such as this, and can tell of days when as yet neither man nor his works existed, when the fauna and flora had nothing in common with what we now see, when the mountains which now are were not, when the arrangements of land and water were totally different from those which exist now. Archæology such as this, however, is not for us to-day; and, indeed, there is plenty to occupy an archæologist without trespassing on ground which belongs to others. In an old country like this, archæology is almost in the air; the names of places, Carlisle, Aspatria, Dovenby, Torpenhow; of mountains, High Street, Illbell, Silverhow; of churches, St. Mungo, St. Bees, Ninekirks; of families, Howard, Muncaster, Le Fleming, Curwen,

Senhouse—these names of places, and persons, and things, together with all the *bys* and the *casters* and the *thwaites* and the *kirks* seem to suggest, even to the most quiet, unimaginative mind, the almost necessity of asking questions as to the way in which names and things have come to be such as they actually are.

But there is archæology nearer at hand than this. Shall I be pardoned if I say that we have before us a remarkable study in archæology every time we read a page of a printed book?

The type is *Roman* letter; it is as genuine a relic of Roman civilisation as the Roman wall itself, and a witness of the days when we borrowed from our conquerors characters in which to express our language, which was not theirs. But what is the language printed upon the page? A composite result, as we all know: what geologists would call a conglomerate—a Teutonic basis, with bits of French, Latin, Greek, it may be Arabic or Hebrew, imbedded in it; so that to account for every word in an ordinary page of an ordinary English book would be a tolerably stiff exercise in what is virtually archæology, even to a well-educated man. But there is a still more curious piece of archæology existing on the page. In the corner you find a number; it is not in Roman figures, but in what we commonly call Arabic; and the complete explanation of these Arabic numerals carries us into the antiquities of India, the ingenuity of ancient Indian mathematicians in inventing what is called the *device of place*, and the manner in which Indian science travelled to the west through Arabia, this transmission being connected with the conquests of the great Arabian prophet, and so forth. The complete explanation of all phenomena presented by an ordinary page of an ordinary English book would form materials for a stout volume of an archæological journal.

But I must hasten to draw this address to a close, lest perchance the earliest part of it should become so ancient, as compared with the latter, as to try the patience even of professed archæologists. Shakespere makes his sententious philosopher in "As You Like It" speak of *sermons in stones*, and I will conclude my archæological remarks with one or two reflections extracted from a stone.

The stone shall be one in the walls of the church of Burgh-by-Sands, to which I have already incidentally referred. It is a stone which has apparently been in its present place for many centuries, and must have looked much as it does now when King Edward I. was here, and when he died hard by. Plenty of rough work in the way of border warfare that stone has seen. But there are certain marks upon it which open up another chapter in its history; experts will tell you that it is a Roman stone, and a very little experience will enable any ordinary eye to detect this fact. The stone, then, has been taken, like many others, which you may single out here and there, from the old Roman station, the existence of which the name of Burgh attests; and so we see that when our stone looked upon Edward I., or when Edward I. looked upon it, it was already an antiquity of respectable standing; it had then been quarried, say, a thousand years, and had witnessed many and strange vicissitudes of men and things. But if we trace the stone further still, and consider how it came to be in the quarry from which it was taken by the hands of the Roman soldier or quarryman, we shall find perhaps that it was formed from pre-existent materials belonging to a condition of the world not one thousand, but a thousand thousand years previous; and so we have archæology beyond archæology, and archæology beyond that. Our stone tells us not merely of mediæval history, nor even of Roman residence in Britain, but it bears in its structure evidence of formations and transformations going on under the influence of the powers of nature in the dim distance of the mysterious past. All things are comparative, and the portion of history with which archæologists are concerned is an almost inappreciable moment in the life of this stone.

Under the influence of such a contemplation archæologists may well feel that after all they belong to the present more than to the past. I will take advantage of this feeling for the purpose of saying that the most recent event in the history of Carlisle has been the preparation which has been cordially and laboriously made for the due reception of the Royal Archæological Institute. I trust that the event, though recent, with its present and future results, will prove interesting even to the most orthodox archæologist who honours Carlisle with his presence.

### MODERN CONSTRUCTION IN ITALY.

A PAPER was prepared lately by Signor C. Clericetti on the "Great Structures erected in Italy during the last Twenty Years."

The author chooses the bridges of iron and stone erected during the last twenty years as the structures which best exhibit the progress of engineering science, and he compares these modern bridges with those built by the Romans. The characteristics of these latter are grandeur, massiveness, and durability; of the former, lightness, economy, and rapidity of construction.

The Po between Pavia and the sea was never bridged by the Romans, but during the last twenty years four bridges have been

built over it. The lengths of these bridges are 577, 762, 427, and 400 mètres; 1,900, 2,600, 1,399, and 1,312 feet respectively; the spans varying from 213 to 250 feet. They are all girder bridges, supported on piers founded at depths of from 60 to 70 feet below highest flood level, and formed of iron cylinders sunk by hydraulic process.

To show the difference between the ancient and modern systems of construction the author compares the Roman bridge across the Danube, one of the boldest of their works, with the modern structures on the Po. The former—1,207 mètres (3,960 feet) in length—had twenty-one wooden arches of 50 mètres (164 feet) span; and the piers—founded on a masonry platform extending right across the river bed—had a thickness of 17·7 mètres; while the piers of the latter, though 28 mètres high from the foundation, are less than 3 mètres thick at the top. The ancient piers had six times the thickness required for a modern girder bridge, and three times what would now be allowed for masonry arches of 50 mètres span. The same immense piers were built throughout the middle ages; the old bridge at Verona, for instance, with two arches of 21·54 mètres and 48·70 mètres (93½ and 160 feet), has a pier 12 mètres thick, though only 3·50 mètres high.

The author proceeds to point out the superiority of the modern system of long spans and narrow piers, in leaving the channel free for navigation and the discharge of floods, and avoiding the scouring action caused by obstacles to the natural flow. In some cases old bridges have so impeded the flow as to cause serious inundations above bridge.

The ironwork of the great bridges over the Po was imported from abroad, but the Italians are now constructing their own, some spans of 75 mètres (246 feet) having been already built, and others of larger dimensions, up to 100 mètres, will shortly be commenced.

The author states that, with few exceptions, only one type of bridge—the lattice-girder—is constructed in Italy, and regrets that little encouragement is given to improvements in design. He mentions a few arched bridges, among them being that over the Celina torrent, which he considers one of the best examples.

The author proceeds to discuss the subject of the incalculable strains to which bridges are liable; from the points of support not being knife edges, as theory supposes; from the vibrations in cross sections; from the vibration caused by passing trains, &c. Airy attempted to ascertain the strain in a bar of iron from its musical note, but the result was not satisfactory. Better results are obtained by instruments for measuring the contraction and elongation of bars during strains, such as the apparatus of Dupuit and Manet in France, and Castigliano's multiple micrometer, which the author describes.

The experiments made with Dupuit's apparatus upon all kinds of girders show that the actual maximum strains are in general less than the calculated, particularly in arches and in the horizontal members of straight girders. Iron bridges are also exposed to danger from corrosion, but the author states that Mallet's experiments proved that an iron bar 6 millimètres (0·238 inch) in thickness would not be destroyed in less than 700 years.

The author then gives particulars of some of the principal brick and stone bridges recently erected. Comparing modern with ancient structures, he points out that the former are built with one-third less material than the latter. In ancient structures the ratio between the thickness of the piers and the span varied from one-fourth to one-half, while in modern it has been reduced to one-sixth, and even one-seventh. The average ratio between the thickness of the arch at the crown and the span was 0·086, while in modern bridges it is from 0·040 to 0·031.

The two principal arched bridges erected in Italy during the last few years are the Ponte Annibale and the Ponte del Diavolo. Each of them has a span of 55 mètres (180 feet), and thickness at the crown of 2 mètres, the versed sine of the former being 14 mètres, of the latter 13·55 mètres. Circular openings 9·25 mètres in diameter are introduced to lighten the haunches. These are the largest masonry arches in the world, with the exception of one at Chester of 61 mètres span, and one on the Washington Aqueduct in America of 67 mètres. In the year 1370, however, an arch of 72·25 mètres (237 feet) span, and 20·70 mètres rise, was erected over the Adda, at the Castle of Trezzo. This arch was considered the eighth wonder of the world, both for size and for the short space of time—seven years and three months—occupied in its construction. The Ponte Annibale and the Ponte del Diavolo were built in twelve and ten months respectively. Among recent improvements in detail the author mentions the use of hydraulic lime and cement, which allows the centres to be struck very shortly after the completion of the arch; and the use of sand-boxes instead of wedges for slacking the centres, a system which he strongly recommends.

The two above-named bridges were built almost entirely of brick, great economy being thereby effected as compared with stone. The Chester bridge, of 61 mètres span, cost 83*l.* per square metre of roadway; the Ponte Mosca at Turin, of 45 mètres span, cost 105*l.* per square metre of roadway; whereas the Ponte del Diavolo cost only 34*l.*, and the Ponte Annibale 24*l.* The author concludes by predicting that the limiting span of brick and stone arches has not yet been reached, and anticipates the erection of spans of 100 mètres.

## THE AMENDMENT OF THE LAW OF LIGHT AND AIR.\*

PRIOR to the Prescription Act 2nd and 3rd Will. IV. c. 71, sect. 3, the right of the dominant owner was not recognised by statute, but depended only upon prescription as recognised by the common law. The common law rights to easements of light and air have been the subject of actions in our courts of law from a very early period, an example of which is found in the group of cases temp. Jac. I., in one of which it appears that the court ordered the partial removal of some buildings which had been erected by a servient owner, and which had interfered with the free flow of air to a windmill. In another case the total removal of buildings was ordered upon similar grounds. There are also in the old reports cases as to light which show the antiquity of the rights given to dominant owners; but these rights arose under a condition of things, both as to density of population, habits of the people, and otherwise, very different to the present. Doubtless, prior to the Prescription Act, the rights to light and air were more difficult of proof, and the Legislature by that statute has conferred on persons claiming as dominant owners considerable benefits which they had not theretofore enjoyed, especially in respect of the easement of light; and they, as a class, have not failed, down to the most recent times, to assert their rights over servient owners in a manner which in many cases has worked great injustice. The system of letting lands in cities and towns for building purposes has been so largely developed since 1832 that an extensive class of persons, both occupiers and owners, exists, of which the members are entitled to claim certain rights, in respect of dominant tenements, such as could hardly have been contemplated by the Legislature when it passed the Prescription Act. It cannot be doubted that servient owners desiring to build have in many cases to submit to extortion and oppression at the hands of owners of dominant tenements whose ancient lights are practically worthless. The servient owner appears in the character of a conquered foe, who must submit. In natural justice, apart from custom and legislation, the rights of the two classes appear equal; and the mere fact of diligence to build ought not to give one owner power and rights over the lands of another for which he has not only paid nothing, but, on the contrary, the very building in respect of which his claims arise may be in itself a serious disadvantage to his neighbour's land. Upon reviewing the decisions of the courts since the passing of the Prescription Act, it is evident that the judges have evinced great and increasing consideration for the rights of dominant owners. For instances of this I would refer to—

The doctrines relating to the acquisition of a prescriptive right to a special light for special business (*Yates v. Jack*, and *Lanfranchi v. Mackenzie*, *Hesty v. Union Bank*).

Power to enlarge ancient lights (*Jones v. Tapling*, and other cases).

Obtaining increased light and air by removal of obstructions in window (*Turner v. Spooner*).

Extra light acquired by dominant owner in lieu of light in the ancient direction. No answer to claim (*Dyers' Company v. King*).

Proof of pecuniary loss by dominant owner not essential. Interference with comfort sufficient. Non-user for several years not material (*V.-C. Wood in Dent v. Auction Mart Co.*, followed to some extent by *V.-C. Kindersley in Manton v. Headon*).

Many other illustrations could be given. The present state of the law, as interpreted by judicial decisions, appears oppressive both in respect of actual loss sustained by servient owners and of the difficulty in carrying out proper plans for building. Whether, seeing that dominant owners have enjoyed certain rights in this country for many generations, an attempt to assimilate our laws to those of France, certain of the United States of America, and other countries, by greatly reducing the rights of the dominant owners, would be successful, it is impossible to say; but it is certain that some important changes in the law are most essentially needed, and these might be so framed as to prove of great benefit to our cities, and to remove what is always a great source of litigation, anxiety, and injustice. The present inquiry may be useful in devising remedies which, without taking away any of the rights which ought properly to be enjoyed by the owners of property so long as the principles of the present law are maintained, should protect servient owners, and, in the interests of the public generally, permit the erection of buildings unimpaired by the opposition of persons who have scarcely more than a technical right to require that the servient owner should shape his buildings according to their dictation.

Doubtless the Council will receive many practical suggestions as to the rules by which the provisions of the Public Health Act and the Metropolitan Management Act, with reference to the width of streets, height of buildings, and the air space to be left between and around large buildings, might be supplemented, so as to afford to the occupants of the houses the highest amount of light and air compatible with a due regard to the proprietary rights of the owners.

\* A communication by Mr. J. J. Darley, addressed to the Special Committee of the Royal Institute of British Architects.

The existing machinery by which the rights of the parties when in issue are defined would, but for the full occupation of the courts of justice on other business, probably afford a speedy and efficient though costly remedy. In the present state of business in the courts if a question of light and air is not decided in a summary way upon injunction, great delay ensues, and much uncertainty is cast upon owners of property pending the decision as to their rights; and as to the question whether the building, if continued, may not have to be either demolished or reconstructed. In view of this difficulty, it will no doubt be in the experience of most architects that every effort is made to buy off the dominant owners rather than incur the expense of litigation; and in the great majority of cases such owners receive compensation, and succeed in securing alterations in the intended construction of the new building, when, if their cases had been decided by a tribunal, they would have got nothing, or only a nominal sum by way of compensation for an easement the damage to which is so small as to be unappreciable. It is true the Act of 21 and 22 Vict. chap. 27, gave power to the Court of Chancery to award damages in addition to or substitution for any injunction or specific performance claimed in respect of the commission or continuance of any wrongful act, and the judges have frequently exercised that power. It may, however, be observed that this Act is more frequently of assistance to the owner of the dominant than to that of the servient tenant, as damages are occasionally given in cases where an application for an injunction would almost certainly fail. I venture to think, in case a bold attack upon the existing principles of the law upon light and air is deprecated by the Council, that the following suggestions might be found to apply some remedy to acknowledged mischief without trenching upon ground likely to provoke suspicion and hostility in Parliament:—

1. That the plaintiff in any action or proceeding to restrain or recover damages for any infringement of his right to light or air shall be allowed no costs against the defendant, unless he shall recover at least 50% damages, or the Court shall otherwise order. The amount here selected is intended to exclude those cases where damage is done, but not enough to justify or account for a *bond fide* resistance. It is true that, by Order LV., Rule I., of the Rules of the Supreme Court, all costs are now in the discretion of the court, but the suggestion here made is intended to supply a rule for the court's guidance which would have the effect of altering the existing practice.

2. That the plaintiff shall not be entitled to restrain the progress of any building by injunction unless the rent of the dominant tenement, in respect of which he claims, amounts to 50% per annum. Opinions may differ as to the amount to be fixed.

3. That, in the absence of express agreement, the builder or tenant of any building shall not acquire any right of easements of light or air as against the owner or tenant of any other building erected upon land belonging to the same owner. This may be effected by the following clause, which Mr. Cates lately informed the Institute is in common use upon an important building estate with which he is acquainted, namely:—

Provided always, and it is hereby agreed and declared, and this demise is made upon the express condition, that the said lessee, &c., shall not, by virtue or in respect of this present demise, be deemed to have acquired or to be entitled to, neither shall he or they, during the existence of the term hereby granted, acquire or become entitled to by length of enjoyment, prescription, or by any other means whatsoever, in respect of the premises hereby demised, any right of air or light or other easement from or over or affecting any land or hereditaments belonging to the lessor not comprised in this demise. But, on the contrary, it is agreed and declared, and the said lessee doth hereby covenant and grant with the lessor, &c., that it shall be lawful for the lessor and his or their grantees, lessees, or tenants, at all times hereafter to erect any new buildings of any height on any land belonging to the lessor not included in this demise, and to raise to any height or alter any buildings not existing, or to be hereafter erected, on any such land as last aforesaid, whether any such buildings or alterations as aforesaid may or may not prevent, obstruct, or affect the passage of air or light to the premises hereby demised, or any part thereof, or to any new building which may hereafter be erected on the land hereby demised.

One of the most eminent judges on the bench has expressed his approval of the introduction of this clause into building leases. There would therefore seem to be little objection to implying it by statute in the absence of a contrary intention.

4. Statutory recognition might be given to some defined angle of incidence up to which limit building might be permitted in all (or at least all but very special) cases. It is probable that 45° will be generally regarded as fair to both sides.

5. A suggestion has been made by Mr. T. Roger Smith which seems eminently worthy of attention. With some modifications, which I venture to suggest, it is to the following purport:—"Every building owner shall be allowed, before beginning to build, to notify his intention by advertisement and by notice affixed to the building, and served on the occupiers of adjacent tenements, and by deposit of plans in some neighbouring public place—such, for example, as the office of the Local Sanitary Authority, or, in the case of the metropolis, the offices of the Metropolitan Board of Works, and under the charge of some public officer or authority for a definite period (probably about two months would suffice, but say three), and during this period he should acquire no right to go higher than

before; but if no protest is lodged at the end of this time he is to have a right to carry out his deposited plan. Within the period to be specified by law for the purpose, any owner of a dominant tenement may lodge a protest accompanied by a claim for compensation; the building owner shall then be entitled to make a survey of the dominant tenement, and if he then pays this claim, all rights of the claimant shall be extinguished so far as the rights of the dominant tenement are concerned. If he pays the amount into the Court of Chancery before any light is interfered with, he is also to be at liberty to go on, subject to the result of an inquiry. If he declines any of these courses, he is not to be at liberty to go on beyond the old height till an inquiry has been held and the compensation been assessed and paid, or, if the result should so happen, an injunction may be granted to restrain him altogether from proceeding further. The mode of making such inquiries should probably be subject to the direction of the Chancery Division; the expenses should, of course, be borne by the building owner, and the usual 10 per cent., as in the case of a compulsory sale, might be added to the amount assessed by way of compensation. Exorbitant claims might be discouraged by requiring the claimant to pay all costs, whatever the result."

6. If the proposals for placing London under a new scheme of local government should be carried out, it might be advisable to entrust a committee of the governing body with a primary jurisdiction, either (1) over the whole subject of easements of light and air, or (2) only so far as to decide in each case whether it is a proper one for an injunction. The appeal would be to the High Court. If the plaintiff should fail to obtain an interim injunction, he should afterwards obtain only money compensation if successful in his action. In conclusion, I would again state my conviction that new legislation upon the subjects of light and air is imperatively needed, and that if a firm and just measure can be passed, it would be hailed with satisfaction by the public.

### INIGO JONES.

THE Society for Photographing Relics of Old London has this year flown at higher game than formerly, and the plates presented to subscribers are of surpassing interest. They are mainly after buildings by Inigo Jones. The attention which has been excited by the proposal to remove Ashburnham House makes the seven plates of Ashburnham House most opportune. The first is taken in Little Dean's Yard, and shows a part of the exterior; but in addition it represents a rather picturesque collection of roofs and chimneys, with the south transept of Westminster Abbey soaring above them. In the next plate we see the front of Ashburnham House, which is a plain building with an upper storey of a later date. The architectural merit is confined to the interior, of which there are four photographs. The staircase forms the subject of two; another gives the fine doorway of the ante-room with its three-quarter Ionic columns, which, it may be noted, are cabled for about half the height. The head is filled with carving, which appears to be less delicate in character than most of the detail. An excellent plate is made out of the end of the dining-room, but the alcove is supposed to have been designed by an artist who lived at a later time. The arch is very flat, and does not seem to spring from the columns. Another photograph represents a part of the garden having a summer-house, with Tuscan columns, and of good proportion. Doubts have been raised as to the authorship of Ashburnham House, and accordingly Mr. Marks, the enthusiastic secretary of the Society, undertook the task of searching after Jones's designs, and with the following results:—

The design of Ashburnham House has been denied to Jones and claimed for Webb; that of the Water Gate of York House has been claimed for Nicholas Stone. In the hope of finding evidence with respect to these and other works ascribed to Jones, I sought permission, which was in each case most readily and courteously granted, to examine the collections of this architect's drawings in the possession of the Duke of Devonshire and of Worcester College, Oxford. These, with some drawings for Whitehall in the British Museum, and a few drawings on vellum of the same subject in the library of Windsor Castle, comprise all the known collections of Jones's designs. By some singular fatality they contain scarcely anything which can certainly be referred to designs known or believed to have been actually carried out by Jones. Drawings, indeed, of the Banqueting House, a part of the projected Palace of Whitehall, are frequent; but one finds no large-scale drawings of the Banqueting House itself; nothing of Shaftesbury House, nor of Ashburnham House, of Lindsey House, of the adjoining houses on the west side of Lincoln's Inn Fields; nothing of the chapel of Lincoln's Inn, nor of the Piazza, Covent Garden. The designs (at Worcester College) for the portico of St. Paul's Cathedral, and for St. Paul's, Covent Garden, are not those which were carried out. The latter, indeed, mentioned by Peter Cunningham in his "Life" (as both Allan and Peter wrote a "Life" of Jones, it is necessary thus to distinguish), I could not identify. Of York House there are known only, at Worcester College, a richly-gilt drawing, unlike any other known drawing of Jones's, for, or more probably from, a ceiling which can be allotted to York House by the appearance on the design of the Duke of Buckingham's motto, *Fidei Coticula Crux*. At Devonshire House there is a drawing comprising a plan and elevation of the Water Gate, the date on which, 1641, forbids us to accept it as anything more than a drawing from the executed work. Of Wilton House there are

only, in the two collections, designs of singular beauty for ceilings; of the Theatre of Barber Surgeons' Hall and of Somerset House there is only a small ground plan of the former. These uniform blanks suggest that the acceptance and execution of a design involved the destruction of the original drawings, for though Jones's drawings have been divided, dispersed and perhaps in some considerable measure destroyed, it would appear that something more than coincidence is necessary to account for the remarkable deficiencies cited above.

The photograph of the Banqueting House which is given is the best we have seen, and one of the Water Gate, reproduced from a negative by Mr. Strudwick, shows the structure before it was partly buried by the formation of the public garden. The remaining photographs are of some of the fine houses on the west side of Lincoln's Inn Fields which were designed by Jones. One is added of Newcastle House, at the corner of Queen Street, which is the work of Captain Wynde, a Dutchman, who was Jones's executor. At present it forms two properties, and the doorway, by a difference in the colour, indicates this; but in the early part of the eighteenth century, before alterations were made in the approach, the building must have been one of the stateliest mansions in "the Fields."

The exertions of the Society to ensure faithful records of the old London buildings are well deserving of encouragement. How the Society is carried on is a mystery, for the production of so many splendid photographs cannot leave balance for the expenses of management. The plates have been prepared in the best style by Mr. Dixon.

### THE LATE MR. A. GILMAN.

ONE of the best-known architects of New York, Mr. Arthur Gilman, died lately. The *American Architect* says that although the most active portion of Mr. Gilman's career was past, he had occupied a conspicuous position in the profession both in New York and Boston, where he practised until within some fifteen or sixteen years. According to his own account, he was intended for the ministry, and was carefully educated at the Dummer Academy and at Trinity College, Hartford, but his active and enterprising temper soon inclined him to more worldly pursuits, and he adopted the profession of architecture, which at that time, and in America, was much less popular among highly-trained young men than it has since become. In 1844 he published in the *North American Review* an article on American architecture, attacking the Greek classicism, which was then in vogue, and predicting its downfall before the Gothic movement which was just beginning to show its strong vitality in England. The article attracted much attention both in America and in Europe, where it was translated into several different languages, and Mr. Gilman was invited to deliver a course of lectures in Boston on his favourite theme. At their conclusion he went abroad for study, receiving marked attention from the best English architects of that time, as well as from literary men and artists. Some years later he was called in consultation on the subject of the improvements to be made in the "Back Bay" district of Boston, then an unwholesome marsh. His taste for grandiose disposition found there an excellent field, and to his persistency in urging his views upon the commissioners who controlled the work is due the adoption of a scheme which has made of a very unpromising territory the finest quarter of Boston, and one of the most beautiful urban regions of the world.

While these improvements were in progress Mr. Gilman, with his partner Mr. Bryant, carried out several fine buildings in and about Boston. Although he never pretended to skill as a draughtsman, he was very familiar with the best examples of his favourite Renaissance, in detail as well as in general disposition, and handled these elements through his subordinates with a success which was probably due as much to his remarkable memory as to his highly cultivated taste. His most important work was the Boston City Hall, which, although rich and quiet, is in our judgment a work of much less artistic value than the First Church on Arlington Street, the Brewer-Beebe houses on Beacon Street, or some other buildings of less pretension. In 1865 he removed to New York, where he was much employed in private work, and in connection with Mr. Edward Kendall devised the magnificent, if hardly legitimate, façade of the Equitable Life Assurance Company's building on Broadway. About the same time he executed an important church on Staten Island—St. John's Church, Clifton, if we remember rightly—and began a very large one in Buffalo, which we think is not yet entirely finished. As he advanced in life, the enthusiasm which made him one of the first and most active members of the American Institute of Architects seemed to abate, partly, no doubt, on account of his rather delicate health, and partly by reason of the incessant demands made upon his time by general society, in which he was always extremely popular; but he will long be remembered in the profession as well as among the innumerable friends who delighted in his brilliant conversation and amiable manners.

A New Hospital is to be erected in Queen's Park, Glasgow, which is to cost 20,000*l*. A premium of 50*l*. will be given for the approved design.

## NOTES AND COMMENTS.

THE following is a *résumé* of the regulations for the new Triennial Exhibitions in Paris, of which the first will be held from September 15 to October 31, 1883, and be open to the most remarkable productions of French and foreign artists executed since May 1, 1878. The works admitted will include (1) paintings, drawings, water-colours, miniatures, enamels, &c., to the exclusion of objects having an industrial or simply decorative character; (2) sculpture, engraving on medallions and precious stones; (3) architecture; and (4) engraving and lithography. On the other hand, are excluded all copies, even when they introduce a work under a different form; unframed paintings and drawings, and anonymous works. The number of works that may be presented for admission by each artist is unlimited; the total number that may be admitted by the jury being fixed at 1,000 for the painting and drawing section, 300 in sculpture, 50 in architecture, and 150 in engraving, &c. Artists must send in to the General Offices of Fine Art Exhibitions at the Palais de l'Industrie during the month of January 1883 a signed notice descriptive of the works executed since May 1, 1878, which they are desirous of exhibiting; this short notice must contain the title and dimensions of the work as well as details of the Exhibitions in which it has already appeared. During the month of March the admission jury will examine these notices, and draw up a list therefrom of works that need not be deposited before August 1. Artists who have not received before April 1 a communication informing them that their exhibits are on this list must send in their works for examination between July 10 and 20. The jury will be composed of members nominated by the Académie des Beaux-Arts and by the Government. It will be divided into four sections corresponding with the categories above enumerated, and be presided over by the Director-Général des Beaux-Arts. The Exhibition will be open every day from 9 A.M. to 8 P.M., except on Mondays, when the doors will be thrown open at midday only. The entrance price is to be 2 fr. up to noon, and 1 fr. after; on Sundays it will be free from 10 A.M.

THE jury of the Vienna International Exhibition of Fine Arts has finished its labours, with the result that France bears off the palm in this contest. Medals have been awarded to MM. JACQUES BAUDRY, WILLIAM BOUGUEREAU, C. BRUYÈRE, C. CHARLAIN, P. DUBOIS, H. HARPIGNIES, A. HUST, and JEAN IDRAC. Germany secured seven medals, Austria five, Belgium three, Spain two, and each of the other countries represented in the competition one.

IN the competition for the Grand Prix de Rome (architectural section) the first Grand Prix was carried off by M. ESQUIÉ, born in 1853, pupil of M. DAUMET; and the two second Grand Prix by M. TOURNAIRE, born in 1862, pupil of M. ANDRÉ; and M. COURTOIS-SUFFIT, born in 1856, pupil of MM. SUFFIT & PASCAL.

A COMMISSION of engineers and architects last week visited the ruins of the Palais de la Cour des Comptes, on the Quai d'Orsay, Paris, in order to examine and report upon their present condition. It was found that the greater part of the walls are solid enough to be included and utilised in the construction of the new Museum of Decorative Art which it is proposed to erect with the proceeds of the lottery lately authorised for the purpose by the Government. It is expected that a considerable saving may thus be effected in the cost of construction.

THE regret will be general at the announcement of the resignation of Lord TALBOT DE MALAHIDE as President of the Royal Archæological Institute, an office which he has held for thirty years. During that time there have been many ebbs and flows in the interest taken in archæology; but there has been no variation in the tact with which Lord TALBOT DE MALAHIDE conducted the affairs of the Institute. His lordship has always been most ready to allow others to bring forward their speculations, and has rarely interfered in debates, although there is no doubt of his mastery of the subject. It will be difficult to find a successor with equal qualifications for the office, and yet willing to repress himself like Lord TALBOT DE MALAHIDE. But, true to the old motto of his house, his lordship has said that he will not leave the Institute in a difficulty, and it is to be hoped that the resignation may be reconsidered.

AN important case was decided by Mr. Justice FIELD on Wednesday. On January 18, 1881, there was a high tide in the Thames, the graving-dock belonging to two of the dock companies overflowed, and a building estate belonging to the plaintiff at Silvertown was flooded. The buildings were much injured and were rendered almost uninhabitable, so as to seriously lessen their value; the building materials were washed away or rendered useless; the houses were flooded to the depth of several feet, and remained so for some time; whereby they were structurally injured and impaired; and so the plaintiff's property was depreciated and the land was for the time rendered unsaleable. The damages were said to amount to 9,000£, but the parties had agreed that, in case the Court should decide in favour of the plaintiff, the amount of damage should be referred to an arbitrator. It was contended that the dock companies, having made an artificial basin for preserving the water to suit their own purposes, were bound to protect their neighbours against any damage arising from that storage of water, and that they had been ordered by the Dagenham Commissioners, who had superintendence of the waterway in this district, to raise their dock wall to the extent of 5 feet above Trinity high-water mark. The plaintiffs maintained that the walls had been raised to the satisfaction of the officer of the Commissioners, that the tide was exceptional in height, and was accompanied by a hurricane. Mr. Justice FIELD said that the walls might have been raised, but it was possible that they had subsided. It was not plain that proper clay had been used, and as there was no evidence to show that houses or chimneys had been blown down, or that any unusual damage had occurred, his Lordship could not come to the conclusion that the weather was of such unusual severity as to prevent a reasonable man from expecting it to occur, and the accident certainly could not be brought under what was called the act of God, so as to exempt the defendants from liability. The amount of damage will be decided by arbitration.

THE question of the gas supply is now debated in Paris. About two years ago the Paris Gas Company endeavoured to obtain from the city authorities a forty years' renewal of its concession from the city. In exchange for this it was offered to reduce the price from 30 cents, the present rate per cubic metre, to 25 cents for all gas consumed through burners, and to 20 cents for that used in motors. The Prefect of the Seine and the Government officials are in favour of making a bargain with the Company on these lines, limiting, however, the period of prolongation to twenty-five years. On the other hand, the Highway Committee, to which the scheme was referred for consideration by the Municipal Council, has reported in favour of its absolute rejection, and recommends that the future price of gas shall be arbitrarily fixed at 20 cents per cubic metre all round, by a simple decree of the Prefect, approved by the Council. A third proposal comes in the shape of an amendment, presented by M. EDOUARD HERVÉ and M. IVES GUYOT, and by which the price would be reduced to 25 cents at once, and by successive stages within five years to 20 cents. This attempt at a compromise, though powerfully supported, will probably rest without effect, for the Council seems fully determined to reject the company's proposals, and in that case a great struggle will take place in the law courts at the expense of the gas consumers and rate-payers.

MR. BRET HARTE, who represents the United States in Glasgow, has sent a report to the State Department on the difference between the flats in Glasgow buildings and those in American cities. It is pointed out that the builder, who usually has acquired a piece of ground on condition of payment of an annual ground rent, must have carefully-prepared plans of his proposed apartment house, showing number of rooms, their arrangement, and plans of the plumbing and drainage, to be submitted for approval to the proper authorities before building can be begun, and after the plans are approved the process of building is inspected by the officials. When completed the house is sold in flats or apartments, each purchaser obtaining a right to the common stairs, to washing and cellarage accommodation, and agreeing to bear his proper proportion of the expense of upholding the roof and keeping in repair the pavements, railings, causeway, water pipes, and common sewers. Taxes are assessed on each flat according to its relative value. The purchasers become absolute freehold proprietors, and can sell, mortgage, or let their flats.

## ILLUSTRATIONS.

AGRICULTURE, A DECORATIVE FRIEZE: CONSTRUCTION.

## HOUSE AT NEWMARKET.

THIS house, which we illustrate, has been built in High Street, Newmarket, of materials from the neighbourhood. Red brick and tiles were used for the walls and roof; and timber-work, with rough-cast between, for the bay window and gables. Stabling has been built at the back of the house to accommodate twelve race-horses. Local tradesmen were employed, and the architect was Mr. FREDERICK W. ROPER, of 9 Adam Street, Strand.

## "HASLEMERE," SUTTON, SURREY.

THIS illustration represents the easterly front of a house now being built by Mr. W. SHURMUR, from the designs of Mr. HERBERT D. APPLETON, A.R.I.B.A., of No. 264 Wool Exchange, Coleman Street, E.C., for the sum of 2,484*l.* The walls are of Fareham bricks, with Ockley hanging tiles, and the roofs covered with Broseley tiles—the half-timber work to be Stockholm, tarred.

## GLASGOW INSTITUTE OF ARCHITECTS.

THE members of the Glasgow Institute of Architects held their annual excursion on the 3rd inst., the place of rendezvous being Dunfermline. Among the members present were Messrs. James Sellars, vice-president; John Baird, past president; Campbell Douglas, past president; William Leiper, F.R.I.B.A.; Alexander Petrie, T. L. Watson, John McLean, William Forrest Salmon, F.R.I.B.A.; James Morris, A.R.I.B.A.; and William McLean, secretary. The party arrived in Dunfermline, having travelled by rail, at 11.45, and were met by Mr. G. Robertson, F.S.A. Scot., and Mr. A. Blair, artist. They first visited the Abbey and Palace ruins, spending a good deal of time in the study of the details of the various styles of architecture. Some of the members of the party seemed to be much struck with the fine specimens of Anglo-Norman and Gothic architecture which are to be met with in connection with the old Abbey Church. The porch at the north doorway came in for a large share of attention. The doorway is of later date than the original part of the church, and has a beautifully groined ceiling, with ten sculptured keystones, containing, among other devices, two defaced shields. The heavy Norman pillars on each side of the nave were also closely inspected. In the course of the day the excursionists drove to Pitfirrane, Broomhall (the seat of the Earl of Elgin), Rosyth Castle, and Inverkeithing. On returning to Dunfermline about 5 p.m., the entire company dined in the City Arms Hotel, starting for home at seven o'clock.

## BOARD SCHOOLS IN GREAT BRITAIN.

THE report of the Committee of Council on Education for 1881-82 states that the schools in England and Wales visited by the inspectors for the purpose of annual grants, which in 1869 provided for 1,765,944 scholars, or for 8.34 per cent. of the population, were in 1881 sufficient for 4,389,633 scholars, or 16.85 per cent. of the population. The additional amount of accommodation in aided schools which has thus been provided since the passing of the Education Act of 1870, to the extent of 1,429,421 seats by voluntary effort and 1,194,268 in Board schools, has been supplied in several ways.

In the eleven years ending December 31, 1881, building grants to the amount of 312,020*l.* have been paid by the Education Department, on the completion of the erection or enlargement of 1,571 schools and 933 teachers' residences, affording new or improved accommodation for 279,874 scholars. These grants have been met by local contributions to the amount of 1,346,887*l.* The average cost of erecting voluntary schools, with residences for the teachers, has been about 5*l.* 7*s.* per scholar. This includes, as a rule, the value of the sites, so often given gratuitously in the case of schools of this class.

The whole of the 3,342 applications for building grants made in 1870 have now been disposed of. In 1,633 cases grants have been paid to the amount of 268,724*l.* 16*s.* 2*d.*; 376 have been rejected; and 1,333 have been withdrawn. About 216,000 additional children have been efficiently provided for with the aid of these grants, and as the schools must be conducted as public elementary schools, they will all come under inspection, and must be placed under the charge of certificated teachers.

In the case of a large number of schools which have been enlarged or improved, without Government aid, certificated teachers have been appointed, and annual grants applied for on their behalf.

The school boards have availed themselves freely of the power of borrowing on the security of the rates, given by the Acts of

1870 and 1873. Up to April 1, 1882, the Government had sanctioned 5,011 loans, amounting to 13,784,694*l.* 1*s.* 9*d.*, to 1,637 school boards, by means of which new accommodation will be furnished for some 1,124,524 scholars. The estimated cost per child is thus about 12*l.* 5*s.* 1*d.*, including cost of site; but the amount of the loan applied for is generally somewhat in excess of the sum eventually spent. The school boards have also acquired a considerable number of schools, either by arrangement with private owners and managers, or, where the premises were held in trust for educational purposes, by transfer under the section of the Act of 1870 specially framed to meet such cases.

In Scotland during the period from 1839, when the administration of the Parliamentary vote was entrusted to the Committee of Council on Education, to December 31, 1881, grants to the amount of 665,961*l.* have been paid in aid of erecting 968 residences for teachers; and of building 1,367 new schools for 279,051 scholars, and enlarging or improving 484 schools for 53,083 scholars—or for 332,134 scholars in all. For 72,081 of these scholars accommodation was provided by voluntary effort, in 422 new and 128 improved schools, at a cost to the promoters of 230,122*l.* 14*s.* 8*d.*, and to the State of 109,411*l.* 3*s.* 1*d.*; or at the rate of about 4*l.* 14*s.* 2*d.* per scholar. But the greater part of this provision has been made since the passing of the Act of 1872, during which period grants to the amount of 556,550*l.* have been paid to School Boards for the erection of 945 new and the enlargement or improvement of 363 old schools, and for 730 teachers' residences. With the aid of these grants, met by local expenditure from the rates, to the amount of 2,031,247*l.*, accommodation has been provided for 260,053 children, at a cost of 7*l.* 16*s.* 3*d.* per scholar from the rates, and of 2*l.* 2*s.* 10*d.* from the Parliamentary grant; or at the rate of 9*l.* 19*s.* 1*d.* per scholar.

## ART AND INDUSTRIAL EXHIBITION, MANCHESTER.

IT is proposed to hold an exhibition in St. James's Hall, Manchester, during October and November next, which will be under the patronage of the Earl of Wilton (president), the Earl of Derby, the Earl of Sefton, Lord Egerton of Tatton, Lord Randolph Churchill, M.P., Lord Combermere, Lord Harrington, the Hon. Wilbraham Egerton, M.P., Sir Humphrey de Trafford, Bart., Sir W. T. Charley, Q.C., D.C.L., Messrs. Jacob Bright, M.P., B. Armitage, M.P., and A. Arnold, M.P. Many of the leading London and provincial firms will be represented, including amongst others Messrs. Gillow, of London and Lancaster, Messrs. Morris & Co., the Venice and Murano Company, and Messrs. W. B. Simpson & Son. Local decorative art will be represented by Messrs. Goodall, Messrs. Doveston, Davey, Hull & Co., and by Messrs. Kendal, Milne & Co. Metal work will be represented by Messrs. Elkington, Thomason, Dutton & Power, &c. The School of Art Needlework will show specimens of their work. Mr. Chas. Steinitz, of the London Parquetry Works, promises to send some fine parquetry. Messrs. Jeffrey and Messrs. Shuffrey & Co., of London, will make special exhibits of their wall papers. Pottery and porcelain will be contributed by the leading firms of the country, including Messrs. Mintons; and there will be a special show of architectural faience by Messrs. Wilcock & Co., of Burmantofts. A feature of the exhibition will be a collection of stained glass. The pictures and statuary will be placed in the new building now approaching completion. The services of Mr. Alfred Darbyshire, F.I.B.A., have been secured as art director, who will arrange and superintend the collection; and Mr. W. Ogden has been appointed to fulfil the duties of secretary.

## MR. RUSKIN AND HIS BOOKS.

THE following piece of "advice by Mr. Ruskin" forms a preface to the latest edition of his catalogue just issued:—"I have directed Mr. Allen, in this and all future issues of his list of my purchaseable works, to advertise none but those which he is able to despatch to order by return of post. The just estimate of decline in the energy of advancing age; the warnings, now thrice repeated, of disabling illness consequent on any unusual exertion of thought; and, chiefly, the difficulty I now find in addressing a public for whom in the course of the last few years of revolution old things have passed away and all things become new, render it, in my thinking, alike irreverent and unwise to speak of any once-intended writings as 'in preparation.' I may perhaps pray the courtesy of my readers—and, here and there, the solicitude of my friends—to refer, at the time of the monthly issue of magazines, to the circular of Mr. Allen, in which they will always find the priced announcements of anything I have printed during the month. May I also venture to hint to friends who may at any time be anxious about me, that the only trustworthy evidences of my health are my writings, and that it is a prettier attention to an old man to read what he wishes to say without effort, than to require him to answer vexing questions on general subjects, or to add to his day's appointed labour the burden of accidental and unnecessary correspondence?"

### THE GLASGOW MUNICIPAL BUILDINGS.

A MEETING of the Glasgow Town Council was held on Monday last, when it was reported that the following are the conditions under which the new Municipal Buildings in Glasgow have been entrusted to Mr. William Young:—

1. That he shall receive, in respect of his whole professional services and expenses as architect, a commission of 5 per cent. on the actual cost of the works executed from his designs and under his superintendence, but excluding from such cost salaries and allowances to clerks of works, measurers, and other outlays and payments which, by the practice of the profession, are excluded in fixing architects' commission, and that the amount of such commission shall be paid by instalments of the amounts after specified, viz.:—For the first year, 3,500*l.*; for the second year, 2,500*l.*; for the third year, 2,000*l.*; for the fourth year, 2,000*l.*; for the fifth year, 2,000*l.*—total, 12,000*l.* The said payments to be made half-yearly at Martinmas and Whitsunday in each year till the work is completed—which completion, it is assumed, will not extend beyond five years from the present date. On the work being completed, Mr. Young shall receive whatever balance may be due and payable to him at the time when the building is handed over to and taken possession of by the Corporation.

2. That, in addition to the commission above specified, he shall receive from the Corporation repayment of the railway fares paid by him in travelling between London and Glasgow in relation to the Municipal Buildings, but no further or other charges of any kind.

3. That he shall, with the approval of the Magistrates and Council, appoint an efficient clerk of the works, whose salary shall be paid by the Corporation.

4. That he shall submit to the Magistrates and Council the names of three measurers resident in Glasgow, and the Magistrates and Council shall select and appoint one of the three whose names are so submitted to act as measurer of the said buildings, and the remuneration of such measurer shall be paid by the Magistrates and Council.

5. That the Magistrates and Council shall be at liberty, from time to time, to ask advice from the City Architect, or any other architect or professional adviser, on all points or matters on which the Corporation may desire to be advised, both as to the design and mode of execution of the work, and to represent to Mr. Young their views and wishes in regard thereto, and he shall, so far as is practicable, give effect to such views and wishes.

6. In the event of any difference of opinion arising between the Magistrates and Council and Mr. Young in regard to any matter connected with the proposed building, the same shall be referred, at the instance of either of the parties, to Mr. Charles Barry, architect, London, whom failing, to the President for the time being of the Royal Institute of British Architects, whose decision shall be final and conclusive, and shall not be subject to review by any court or other tribunal.

The Lord Provost, in moving the adoption of the minutes, said he was aware that some of the professional journals seemed to be dissatisfied, but amongst themselves no doubt was entertained as to the fair and straightforward manner in which the competition was conducted. The minutes also showed with what carefulness the committee had proceeded to ascertain whether Mr. Young was altogether competent for the work to be performed, and he thought the Council would be satisfied they had the utmost reason to believe that Mr. Young was a gentleman into whose hands they could with perfect safety entrust these great buildings. Financial arrangements had been made with Mr. Young which his lordship thought would prove satisfactory. He need hardly remind the Council that in the earlier years of the undertaking the largest amount of expense would require to be borne by Mr. Young, and it was but right that he should then have a larger proportion of allowance. The suggestions which were made in the minutes as to measurers and other officials would also, his lordship thought, prove satisfactory. The opinion of some was that the architect himself should have the appointment of these officials, but it was deemed expedient to retain some of the power in the hands of the Town Council; and it was therefore proposed that the architect should put before them three competent measurers, one of whom should be selected by them. With regard to the exhibition of the designs, he might say that, although they had not the authority of the Town Council, they did not think it prudent to stop the exhibition, since it had been advertised. Accordingly, these designs had been on view, and during the two days of last week upwards of 400 visitors had seen them. He could not, of course, tell what impression had been created by the designs further than to say that, on the authority of an eye-witness and an ear-witness, there seemed to be a very general expression of opinion that the selection which had been made was that which the general public also would have made.

Mr. Martin said he thought the Town Council should keep the appointment of measurers in its own hands. It was not to be supposed that a stranger, comparatively speaking, should have a thorough knowledge of the measurers of Glasgow. Then, with regard to the time allowed for the exhibition of the designs, it ought to be greatly extended—say for a fortnight at least from the

present time. As to the name of the author of the designs of "Viola," Mr. Martin said he had told them that the author was Mr. Young long before the meeting in the beginning of July.

The Lord Provost thought it right to say that Mr. Barry and Mr. Young met for the first time in London. They had never seen each other before. Mr. Barry had heard of Mr. Young by name, but he had never seen him. The same remark held good with regard to Mr. Carrick. His lordship added that their interviews in London were of the most satisfactory kind, and the information furnished him was such that he had the utmost confidence in recommending his colleagues as he did that they should appoint Mr. Young. (Cries of "Agreed.")

Mr. H. S. Thompson asked why it was proposed to pay Mr. Young a commission of 5 per cent. on the actual cost of the work executed, while on other buildings the commission had been not more than 3 or 3½ per cent.

The Lord Provost said that anything under 5 per cent. was an unusual commission. The Council had held strictly to the engagement they made with all the competitors, namely, that the usual commission of 5 per cent. should be given, with travelling and other expenses. Mr. Young had very frankly given up any claim for expenses beyond travelling expenses, and the committee looked upon it as rather an important matter that they should offer every inducement to Mr. Young to visit Glasgow frequently by paying his travelling expenses. The more frequently he came to Glasgow, the more satisfactory would be the buildings.

Mr. Reid pointed out that no provision had been made in the event of the building not costing the estimated sum—although he did not think that probable—for withholding the commission on the amount under the estimate.

The Lord Provost dared say the Council did not expect the buildings to be completed for less than 250,000*l.* He might supplement the information he had already given them by stating that gentlemen for whom Mr. Young had done work had spoken to him in the highest terms of the manner in which he had carried out the operations, and the estimates had not been exceeded. It would be a new experience to them if that were the case in regard to the new buildings.

Bailie Selkirk asked if Mr. Young had anything to do with furnishing the buildings.

The Lord Provost stated that Mr. Young's engagement at present was only in connection with the buildings. If the Council at a future time asked Mr. Young to design furniture or anything of that kind for the buildings, that would be an extension of his engagement.

The minutes were approved.

### CARLISLE CATHEDRAL.

DURING the meeting of the Royal Archaeological Institute at Carlisle there was a visit to the Cathedral. The members met in the Fraternity, where the chair was taken by the Dean. Dr. E. A. Freeman by request described the cathedral. On taking his stand outside the building he said that if a learned man had been suddenly dropped from the clouds into the cathedral garth, and began to think how much he could find out for himself without any man or book to guide him, he would readily find, if he lifted up his eyes to the windows of the upper part of the cathedral tower, that he was in England. He would see Perpendicular windows which could not be found anywhere but in England. He would know at once that he was under the shadow of a great church, and it would not take him long to find out what was the character of the church. It would not take him long to find out it was a Regular church. He would see there were buildings on the right, parallel to the nave, and he would at once feel they were the refectory, and he would be helped to that conclusion if he had been dropped down at Furness and Calder Abbeys before he came to Carlisle. He would see it was not a Cistercian church by the arrangement of the buildings, because in the Cistercian churches the refectory was not parallel to the nave. Then he would doubt, probably, whether it were a Benedictine church. As a matter of fact it was not Benedictine; it was a church of the Austin canons. He would not be able to say positively to what order it belonged; but he would be able to say it was a great English church of some order of monks and not of the Cistercian order. A further question might be whether it was merely a collegiate or conventual church, or the church of a bishop. He did not think there was anything to tell him it was a see—any episcopal palace. Some local antiquary should be able to tell them whether there was ever an episcopal palace in Carlisle, as there commonly was in episcopal cities, and if not, how there never came to be one—whether it was connected with the long vacancy of the see after the first bishop, or whether after bishops had got feudalised and turned into barons they did not care to have a house in the city. As to the time of the building of this church he would say, Here we have a Norman minster, not of the smallest size or the greatest, but a moderate-sized Norman church of which we still have fragments of the nave. He would like to have information to know under what circumstances the nave came to be shortened, but our inquirer could not doubt that there was a much longer nave once than they saw now; and if he were told that it was a church of Austin canons he might

begin to guess even from the outside a little further. He might perhaps guess that the nave had been the parish church, that being the common custom among the Austin canons. That was a point which distinguished this church from other old-standing cathedral churches in England proper, with a few exceptions. The nave was the property of the parish, and was used as the parish church. The inquirer would see himself that here had been a church in the twelfth century, a comparatively small church, and that a vast and magnificent choir of the thirteenth or fourteenth century had displaced the original eastern limb in a very remarkable way. And he would also see that somebody had in later times gone and destroyed the history of the place by sticking in that grand doorway where no grand doorway was or never ought to be, that the history of the past had been wiped out in order to bring in the pretty things of the present. Here was the refectory, there was the walk in the cloister, and there was the dormitory. There was a little door in the transept originally, but no grand door was there, because there was no grand entrance. Why had the church not been left to tell its own story, to tell every man that the dormitory had come up against the church, and leave the signs that there were of it instead of giving us that new masonry? No doubt the new doorway was a fine thing of its kind, but why not leave them those fragments of history which they came from place to place to make out? It was disappointing when they came to a place to find that some ingenious man had done his best to wipe out the history of it, and that there had been a perfectly wanton sacrifice of the building to make the thing pretty. A doorway was wanted, no doubt, but why not stick it somewhere else, and not destroy the historical fragment?

On entering the Cathedral, Dr. Freeman remarked that the nave had not been very early nor, on the other hand, very late Norman work. If it was the work of Bishop Athelwulf, who was Bishop of Carlisle for a long time, he should be well pleased. Turning to the choir, he pointed out the manner in which it had been widened and otherwise enlarged, and remarked that no doubt, when the grand choir was built, it was intended some time to pull down the nave and rebuild it, or it might be that the nave, being the parish church, was not thought about, and the choir was enlarged without regard to the nave at all.

Moving into the choir, Dr. Freeman next pointed out the beauties of the choir. The east window, he said, was the grandest window of the kind in England, and he supposed the world. There was a very big window in a church at Perugia, in Italy, that somewhat reminded him of it, but here they had the finest piece of tracery to be seen anywhere. The next to it was that in the Abbey Church at Selby, in Yorkshire, but that had only seven, whereas this had nine bays, and if his memory did not fail him, the bays at Selby were wider. He pointed out the peculiarities in the construction of the roof, no attempt having been made to vault it. He next drew attention to the series of lancet windows in the aisles, remarking that they were rather more perfect than they ought to be. One or two windows had been put in. It was a very curious thing that if there was a piece of history in a building marking its age there came a wise, modern architect, a man of taste, with his head full of his own ideas, who felt himself as much above history as the King of Rome did above grammar. This modern architect came and said, "I am the only person who am upon a level with the original architect; I am the only person who knows what he would have done." So the work must be swept away. The wise man of taste must wipe out everything and bring it back to what he supposed it would have been in his pet century. This wiping out of history, this destruction of the history of an ancient building was called by the strangely sarcastic name of "restoration." Restoration commonly meant wiping out of history and building up according to the fancy of some architect to whose tender mercies the building may have been handed over. So it was here. These windows were not the original thirteenth century windows—they were windows of the nineteenth century, something else had been stuck in and so wiped out history. He expressed some doubt as to the propriety of fencing off the choir from the nave, remarking that he was tossed to and fro on the subject between the past and the present. In such a case the past was the least harmless, but the case of Carlisle was different, as so little of the nave remained it was necessary to use the choir as the church till somebody should rebuild the nave. If anybody did that he hoped they would build it in nineteenth-century architecture, and not thirteenth.

The Mayor of Carlisle described the upper portion of the east window, and the effigies to be found in the aisles. Mr. Fowler described the capitals of the pillars of the choir, the designs representing the twelve months of the year, as had been made out by his brother, Mr. Fowler, of Wakefield.

Professor Stevens, of Copenhagen, explained the runic inscription in the transept to mean "Dolfin wrote these runes"—that is to say, carved these letters. It was, he said, simply a scribble, and such scribbles were very common in Scandinavia. Sometimes the words were added "To the honour of God." Sometimes they were carved in stone or granite, but sometimes they had been scribbled by the workmen, with his finger or a piece of stick, on a soft brick before it was baked, and then when the brick was baked it was built into the wall. Its date was the tenth century.

## THE STUDY OF ARCHITECTURE IN AMERICA.\*

THE theory and practice of art, united in the person of the master builder of old, produced works which succeeding ages may hope perhaps to emulate, but never to excel, unless, indeed, by a return, not to the conditions of the past—for that is impossible—but to the practice of similar principles and methods, though worked out in a different way. In modern times the office of designer and builder have been divorced, with consequences exceedingly detrimental to each. The former is no longer, as in ancient times, charged with execution of his own designs. His knowledge and experience are therefore likely to lessen as regards the adaptation of materials to special or general purposes, and to become more or less superficial; while the builder, no longer responsible for the artistic quality of the design which he executes, has less and less scope as well as encouragement for the development of knowledge, taste, and skill in the execution of his work. How utterly wrong is all this, and how impossible for either the one or the other to succeed in producing a satisfactory result! Again, while the arts of printing and photography have been instrumental in rendering all who desire it familiar with almost every architectural structure of any note in the civilised world, there has been developed an excessive tendency nowadays to adopt the forms of art without regard to the materials in which they are to be embodied, together with an indiscriminate selection of details of every age and style, without regard to the simple principles involved in their origin, growth, and development.

Speaking professionally, the greatest need of the present day is, first, true taste and accurate knowledge of art in the designer, united with a thorough knowledge of materials and their proper adaptation to truthful construction; second, a public whose educated tastes will detect and condemn every subterfuge, and whose sense of the *ideal* will be satisfied only by the *real*; third, a system of professional instruction for our students or young designers which shall educate teachers as well as taught, and which in effect shall be practical, sufficient, and sure, and which shall embrace not only the highest but the lowest level of the art.

Assuming these three propositions to be granted; with regard to the first, I would suggest that at every regular meeting of the Chapter papers should be read on the exceedingly varied and instructive topics with which the general theme of architecture so greatly abounds. We live in an age of vast development of the material sciences, and the importance of their judicious application and economical adaptation to the endlessly varying wants of constructive design furnishes a never-failing source from which to draw for a subject:—The best methods of construction, past and present, with such suggestions of still greater improvements as may from time to time occur; the question of interest surrounding the subject of *plan*, with its developments, historical and national; the great question of a universal style, parallel to that still greater problem, that of a universal language, to which it bears a large analogy; the development of a truthful treatment of material in construction, before alluded to, and, an equally important matter, the adoption of the most substantial of materials, though attended, it may be, with a sacrifice of mere meretricious ornament which possesses in itself neither use, beauty, nor meaning. Then the question of ornament itself, and its proper treatment in harmony with the material in which it is to be executed. All these, together with many others too numerous here to particularise, might be taken up as specialties by different members of the Chapter, and pursued systematically; and, if followed by discussions and criticisms, would doubtlessly prove eminently beneficial to all concerned.

For the general public, who are apt to imagine that on matters architectural their knowledge is complete, periodical lectures would probably be of great use in arousing interest in the many subjects in which the public have so much at stake, as well as establishing in their minds true principles of taste, and a just and critical judgment as to what constitutes true beauty in architectural design.

Thirdly, and most important of all, the students. It is evident that unless our young men are gradually prepared by intelligent training to take our places in the professional ranks, that either those ranks will be replenished by raw recruits unfitted for the work they have to do, or that foreign talent, of which there is so great an abundance ever pressing at our doors, will step in and supply the public need in designing our dwellings and public buildings, thereby fixing upon us the national peculiarities of style to which its representatives are respectively most attached—generally at variance with the prevailing characteristics of our national taste, and ill-adapted to our climatic requirements. At the best, we shall possess but a feeble and soulless jumble, ever varying with the latest importation of professional taste.

How much better that our young men should be thoroughly furnished, through careful study and assiduous training, by the best and most practical methods within our and their reach; so that they may themselves supply the public demand, and by harmony

\* From an address delivered before the San Francisco Chapter of the American Institute of Architects, by the President, Mr. John Wright.

of effort and unity of thought strive to found and establish on this Pacific coast a school of our own which shall be free from the inherent defects which a variety of foreign styles and methods of building are sure in some degree to possess. To this end I beg to make the following propositions, to be followed by such action in the premises as in your good judgment may be deemed best.

1. To establish a free class for architectural students belonging to the Chapter, the class to be instructed by members of the Institute who shall take up such special branches of study as they may consider themselves best fitted to impart, and who shall give their services free of charge.

2. That the system of study and reading, which may be arranged in harmony with the above, be supplemented by periodical competitions among articulated students.

3. That at the end of three years, a six months' travelling studentship, providing for a tour in the Eastern States and Europe, be established; the privilege of which shall be given to the student obtaining the prize in a competition to be held at that time; the expenses of said student not to exceed say six hundred dollars, and to be paid out of a fund created by the fees of life members. Such fees to be invested as a nucleus of a fund to be kept sacred for the above purpose. In case the interest of said fund be found insufficient for the purpose, the balance to be paid by the Chapter.

The result of some such course would be a systematic study of styles and modes of construction, historical and national, from the best models and under the best available tuition, thus rendering the student familiar with the development of the art from the earliest times. Also the comparative study of real buildings as a final preparation for the chosen work of his life, the success of which would be almost assured by such a conclusion of his arduous study. And lastly, the placing of a sufficient inducement before the student, to lead him to devote himself with earnestness to the work before him.

### CRESSET STONES.

ONE of the papers read before the meeting of the Royal Archæological Institute was by the Rev. J. Lees on "Cresset Stones." The author said that a cresset was a cup of earthenware or metal fastened to the top of a pole, and containing a light, and so forming a portable lantern. When the pole was fixed in the earth and so became a stationary light, the whole apparatus was styled a beacon. Having referred to the place of cresset stones in Heraldry, he traced the derivation of the word "cresset." The application of the word to the cup containing the light brought them to the true derivation. "Cresset" was the middle English word for a cup or vessel containing light fixed on the top of a pole, and came to us through the Old French *crasset*, a cresset, *croiset*, *creuset*, a cruet, pot, crucible (with which last word it seemed most reasonable to ally it); from the Old Dutch *kruyse*, a cup or pot. From the cup, metal pot, or crock the word "cresset" was transferred to a cavity hollowed out in a stone, in which a light was burned. Hence the stones containing these cavities were called "cresset stones." There were three of these in the church and monastery of Durham. They found them described in the "Rites." One was in the church itself, and the two others in the dormitory. These were not earthenware or metal cups standing on or inverted in the stones, but the actual hollows themselves "wrought" in the stone. At a meeting of the Cumberland and Westmorland Archæological Society at Furness Abbey in 1877 he read a paper on the "Probable Use of certain Stones found in the Ruins of Calder and Furness." Two of these were undoubtedly cresset stones; and since the appearance of that paper he had received information regarding such stones from various quarters. Sir Henry Dryden had shown the greatest interest in the matter; and it was at his suggestion, and encouraged by his advice and kindly assistance, that he now ventured to present this subject to the notice of the Institute. He read a list containing particulars of all examples yet brought to his notice. The Swedish ones he knew were called "Holywater stones," or "Vats," but this term seemed misapplied. The list of examples included the cresset stones at Calder Abbey, Furness Abbey, Wool Church, Dorset; Sewanick Church, Cornwall; Carlisle Cathedral; St. Mary's, Monmouth; St. Mary's Abbey, York; Llanthony Abbey; Stockholm Museum, and other places in Sweden. The description of those at Carlisle Cathedral will be interesting. During the restoration of the Fraternity, Carlisle, in 1830, Mr. Creed, the clerk of the works, discovered a cresset stone among other relics stored in the room over the Chapel of St. Catherine in the south transept of the cathedral. Like the fabric itself, this was new red sandstone. What the size or thickness of the stone or number of cups was they had now no means of judging. It seemed, however, to have been rectangular in shape, for a portion of one straight edge remained. It contained the remains of six cups, the circumference of one only being complete, and its base "shaded off" from the natural splitting of the stone. These cups, though not symmetrically placed, seemed all to have been of the same size as the one which was tolerably whole—viz., 4½ inches diameter and 3 inches deep. Soot and fire marks remained in the cups, and there could be no doubt as to the original use of the stone as a cresset stone. Mr. Creed pointed out to him the

interesting fact that the hollows were such a shape as would ensure the entire consumption by the wick of the fat with which they would be filled. Speaking generally of the examples brought before them, he said they all belonged to mediæval times; but was it not probable that their forefathers of the Middle Ages derived their use of hollowed stones for light-holders from still earlier times? Might it not be that the discovery of the use of cresset stones was a step, and a long one, towards the elucidation of the purposes to which those cup-marked stones were put, which had formed so long a puzzle to the prehistoric archæologist.

Sir Henry Dryden also read a paper on "Lamp Niches." He said that in several buildings were small niches or receptacles for lamps, and these were connected with cressets, inasmuch as several of them had in the floor or flat bottom single cups or cressets. Some had chimneys or flues which passed upwards—in some cases passing into the chimneys or fire-places. Others had conical hollows in the heads which he supposed to have caught the soot and prevented its passing out into the room or church as the case was. The date of each must be decided not by the niche itself, but by the structure in which it was. The earliest of which he had illustrations were those in the crypt at Hexham. These were three in number. In the floor of each was a single cresset, and in the roof of each was a conical hollow. They were all rectangular, without any ornament. He described several examples of lamp niches. Some of these niches, such as that, for instance, in the choir practice-room at Westminster, must have been for the preservation of a light and not for the purpose of lighting the room. Why these niches were preferred to the open room for the station of a light was a question. He could only suggest that a cheap smoky light merely for the purpose of preserving a light might burn better in a narrow space with a draught of air across it than in the open room, and be less likely to be blown out. That other niches, which he described, were intended for lamps was shown by the cressets in some of them and by the flues proceeding from them.

Dr. Stevens said the stones were largely known in Sweden as elf-stones, and the rubbing of them with grease was an offering to the household gods or elves.

### MEDMENHAM AND BISHAM.

THE members of the Berks Archæological and Architectural Society lately visited Medmenham and Bisham Abbeys, on the Thames. Mr. Rutland read papers on both buildings.

The Manor of Medmenham, soon after the Conquest, was given to Hugh de Bolebec, one of the Norman barons who came over with William the Conqueror. His elder son, Hugh, founded the Abbey of Wooburne, in Bedfordshire, in May 1145, and gave the Manor of Medmenham to found a cell to it. A charter of King John in 1201 confirmed the gift, and in 1204 some of the Cistercian monks of Wooburne came and settled here. In the beginning of the sixteenth century it was annexed to the Abbey of Bristleham or Bisham, in the county of Berks. On the suppression of the monasteries by Henry VIII. the commissioners returned that this monastery was "of the Order of St. Bernard (who became a Cistercian monk in 1114); the clear value, 20*l.* 6*s.* 2*d.*; monks there two, and both desyren to go to houses of religion; servants none; bells, &c. &c., worth 2*l.* 6*s.* 8*d.*; the house wholly in ruin; the value of the moveable goods, 1*l.* 3*s.* 8*d.*; woods none; debts none." The Abbot of Medmenham was *ex officio* epistolar of the Order of the Garter, and his duty was to read the Epistle in the morning service on St. George's Day at Windsor, when the sovereign celebrated the annual feast. The Abbey Church seemed to have been a stately building, well wrought with ashlar work; the windows high and spacious. It probably consisted of a body and two side-aisles, and chancel, and had a tower at the west end. Langley, in 1797, remarked that "the chapel no longer remains, and only one pillar is standing of the north aisle. The figure of the Virgin, seated on a throne and holding the infant Saviour in her arms, carved in marble, still remains, and is placed in a niche of the tower." After the suppression of Bisham Abbey, the abbey and lands of Medmenham were granted to Robert Moore, and the family of Duffield succeeded soon afterwards, and possessed the estate till 1779, when the site of the Abbey was purchased by John Martin, Esq., Chief Justice of Chester, and sold by his widow, together with Danesfield, in 1786 to Robert Scott, Esq., who bequeathed it to his widow for life, and at her death to her nephew Charles Scott Murray, whose son is the present possessor. Mr. Rutland then gave some account of the celebrated association of men founded in the last century under the title of "Monks of St. Francis," and also called the "Hell-fire Club," which met at Medmenham, and was broken up in 1764. Part of the "cradle" in which the notorious John Wilkes (one of the members) slept, is still preserved at the Abbey, and the motto of the club, "Fay ce que voudras," is still over the door. The church (dedicated to St. Peter) is an ancient fabric, composed of a nave and chancel under one roof, a west tower, with three bells, and a south porch, the inner door of which is Norman. On the north wall are traces of a large arch. The tower arch is lofty, but there is no

arch or screen between the nave and chancel. In the south wall is a piscina, under a plain pointed arch, and in the north wall is a large ambrey with ogre head. The pulpit, of oak, is hexagonal, and carved. The church contains some old painted glass.

The manor of Bisham, Bristleham, or Bustleham, was given to the Knights Templars by Robert de Ferrarius (to whose grandfather it had been granted by William the Conqueror) in the reign of King Stephen, and a preceptory built on it. On the downfall of the Templars in 1312 it was granted to the Knights Hospitalers; and again in 1335 by Edward III. to William Montacute, Earl of Salisbury, who in 1338 built here a priory for Benedictine Monks of the order of St. Augustine, and endowed it with 285*l.* 1*s.* per annum. It was, according to Ashmole, "basely and contrary to the most solemn oaths," surrendered in 1536 to Henry VIII., who refounded it in the following year and endowed it with the lands of Ankerwyck, Chertsey, Little Marlow, Medmenham, and West Wycombe, to the amount of 661*l.* 14*s.* 9*d.* a year, for the maintenance of an Abbot and thirteen Benedictine Monks, and intended to have granted the privilege of the mitre to it; but in three years suppressed it for ever. The place was subsequently granted by the King to his repudiated wife, Ann of Cleves; but owing to his death before the seal was affixed to the deed, and to the troubles during the reign of Edward VI., it was not till the time of Queen Mary that it absolutely became her property. By permission of the Queen she exchanged Bisham with Sir Philip Hoby for his house in Kent, and the property remained in the Hoby family till 1768. The Princess Elizabeth resided two or three years at the Abbey; and in one of the apartments, still called her Council Chamber, a bow window was thrown out and a dais erected for her use. The windows in the Council Chamber contain some ancient shields of painted glass, two of which were in the church at Bisham. Among them are those of Montague, who married Catherine, daughter of Lord Grandison, created Earl of Salisbury, and who died in 1343; Sir Richard Pole, and the Lady Plantagenet, his wife; the Countess of Salisbury, beheaded by Henry VIII.; and Cecil, Earl of Exeter, who married one of the daughters of Neville, Lord Latimer. These are the only pieces of stained glass which seemed to have escaped the fury of the Puritans. The windows of Bisham must have been very rich in painted glass. The Hall was formerly the site of a preceptory of Knights Templars, and afterwards the Church of a Priory of Benedictine monks. The bones of the founder of the Abbey, John Montacute, Earl of Salisbury, are said to have been removed hither by Maude, his widow, from the Abbey of Cirencester. When the ceiling of the hall was removed it disclosed an early English roof of oak, which has been thoroughly restored. At the east end is a fine Early English window, now built up and painted in imitation of coloured glass. When the plaster which for a long time had blocked the window was removed, the stone mullions were found in tolerable order; and on the upper part of the window was discovered a fresco of St. Peter with the Holy key, and the colours were in such a state of preservation that it was easily restored. In a recess on the north side of the hall is a fresco by Roddam Spencer Stanhope, representing the death of Thomas Montague, fourth Earl of Salisbury, and his esquire Sir Thomas Gargrave, at the siege of Orleans in 1428. His tomb, and that of the Earl of Warwick, the "King-maker," who was also buried here, was destroyed by Sir Thomas Hoby when he erected the oak screen at the entrance. Here also rest the remains of William, Earl of Salisbury, his son John, Earl of Salisbury, Richard Neville, Earl of Salisbury, and his two sons, Richard, Earl of Warwick, and John, Marquis of Montague, and Edward, Earl of Warwick, the last of the male line of the Plantagenets. Most of these illustrious characters had splendid monuments in the conventual church, but they were all destroyed after the dissolution of the Abbey. On the south side of the hall is a magnificent marble mantelpiece, with richly-carved oak panelling, which was originally given by James I. to the then Earl of Plymouth, and was brought here from the earl's country seat in Worcester, in 1843. The panelled room adjoining the hall is a fine specimen of domestic architecture, and contains a large number of notable portraits, including Van Tromp, by Sir Peter Lely; General Monk, by Peter Bursler, and another by the same artist of John Claypole, who married Cromwell's second daughter; Prince Henry, eldest son of James I., by Zuchera; Henrietta Maria, by Vandyke; Princess Caroline, mother of George III.; and two prints of George III. and Queen Charlotte, which were presented by the latter to the eldest daughter of the late Mr. G. Vansittart. There is also a singular painting of Lady Hoby (whose husband died in France in 1566), who is supposed to haunt one of the bedrooms, preceded by a self-supported basin in which she is perpetually trying to wash her hands. It is remarkable that the apparition is always in the negative, the white parts being black and the black white. The legend is that she beat her son William to death because he could not write without making blots; and it is very singular that about forty years ago in altering a window in the dining-room a number of children's copy-books of the time of Queen Elizabeth were found pushed between the joists of the floor, one of the copy-books being smothered in blots. Behind the tapestry in one of the bedrooms a secret room was discovered. The principal en-

trance to the mansion is through an Early English doorway of stone, deeply recessed, with pointed arch, and supported by slender stone shafts, and a groined roof within. This, and the hall, are the only remaining portions of the work of the time of King Stephen. The rest of the house is in the Tudor style, and was the work of the Hobys. In the grounds can be traced, in very dry seasons, the foundations of much of the old Abbey; and the original moat round the grounds still remains. The estate was purchased in 1781 by Mr. George Vansittart, who represented Berkshire in Parliament from 1784 to 1812.

#### Mr. Burges' Advice.

SIR,—The letter you published last week from a "Student of Nature" hardly seems calculated to advance the interests of the profession.

In this age when money-getting is regarded as the chief end in life, is it wise to criticise so severely any attempt to hold up art as an object to be pursued for its own sake?

Even in an architectural student of the age of 26 or 28 may not some germ of artistic feeling be still latent, waiting only for a favourable opportunity to develop? Is there no truth in the "Mute inglorious Milton" theory, or in the homely expression, "You never know what you can do till you try?"

Though probably anyone possessing *great* artistic ability will feel a strong desire to exercise it, yet may not uncongenial circumstances retard, and in some cases quite smother, the feebler impulses of ordinary men? And it is of these the bulk of the profession must be composed.

We are all formed from the same clay, and possess the artistic faculty in a greater or less degree. Compared with that of Pheidias or Titian the sense of form or colour possessed by a "Student of Nature," he doubtless will admit, must be faint in the extreme. Should it not be our endeavour to develop the little we have to its utmost perfection? A "Student of Nature" appears to think that Mr. Burges' advice may result in harm instead of benefit.

Let us take an extreme case. The lowest form of architecture, it will be readily admitted, is to be seen in the work of speculating builders: were these compelled to go through a course of figure drawing or sketching from nature, would their work be worse than it is?

Instead of throwing cold water on any endeavour, even though a tardy one, after higher things, let us say to our fellow-students, aim high, and then if your efforts end only in failure, that failure will be more glorious than the successes of other men.

Your obedient servant,

H. G. N.

August 9, 1882.

#### Surveyors' Fees in Criminal Cases.

SIR,—As an architect and surveyor practising in a Midland town, I desire to ask a few questions in your paper as to the practice of assize courts with regard to the scale of fees, plans, attendance, travelling expenses, and the like allowed to our profession. I trust I may therein receive such an answer that may decide the future action to be taken in what I consider an injustice. In the ordinary course of professional business, I was sent for by a firm of solicitors prosecuting for the county in a case of assault and manslaughter, to prepare a plan of the premises where an alleged assault and manslaughter had taken place. These premises are in the country, between five and six miles from my office, and to reach them it was necessary to drive there and back, which I did, taking measurements, plotting, attending solicitors thereon, and finishing plan for assizes. When requested, I gave the solicitors' clerk my account, 4*l.* 4*s.*, to present to the taxing-master of the court, which I think a moderate charge for two days' work, and horse, &c., hire half a day. In addition, I attended upon subpoena for two days at the assizes, and travelled twenty-four miles each day, for which I expected the greatly reduced fee of 1*l.* 1*s.* per day and second-class railway fare (6*s.*), making a total of 6*l.* 12*s.*

My fellow-architects I am sure imagine my disgust when I found that the taxing-master (without my being present) allowed 10*s.* 6*d.* only for the preparation of plan and journey to obtain measurements, 1*l.* 1*s.* for two days' attendance at the court, and 4*s.* railway fare—total 1*l.* 15*s.* 6*d.*, which I received and signed for under protest. The questions now arise as to how I am to obtain redress, and what is the best way to proceed. What remedy have I against the court to obtain the balance? I am told there is no appeal, and that the taxing-master can award what he pleases. Is this so? It certainly appears hardly justice that the prosecuting solicitor should be called on to pay the balance out of his own pocket.

I have no doubt some of our professional brethren have been similarly situate. Can they give me the benefit of their experience

in such matters? What are the authorised assize court fees for an architect and surveyor's attendance, &c.? Any information they can give will be esteemed a favour, and I trust be appreciated by your readers, as by  
Yours faithfully,  
A COUNTRY ARCHITECT.

### REVIEWS.

WEALE'S RUDIMENTARY SERIES. Vols. CCXXVI. to CCXXX. Crosby Lockwood & Co.

The latest additions to Weale's Series uphold the character of that useful collection of handbooks. The subject of No. 226 is "The Joints Made and Used by Builders," and the volume has been compiled by Mr. Wyvill J. Christy. The author has exercised much industry in arranging the joints of the different trades, and as construction is mainly the putting together of pieces, the little book, if it is not an epitome of the builder's art, is not far from being so. There is no volume in the series which is more useful.

A new edition of Mr. Campin's "Treatise on Mathematics as Applied to the Constructive Arts" is the next volume. As the author is a civil engineer he is able to suggest the relations between abstract science and practice throughout his book, and the architectural or engineering student consequently finds his progress facilitated by the constant reference to familiar things. Any book bearing Mr. Tarn's name is sure to be well received among architects. His "Construction of Roofs of Wood and Iron," which is 228 in the series, is described as an introduction to larger works. It is clearly written, but a great many of the examples refer to large structures. In a book for beginners it would be more advantageous to have several types of roofs which are required in every-day practice. It would have been easy to tabulate the information and to supply simple diagrams. Mr. Tarn would also render a service to students if he contrasted the theoretical dimensions of a few well-known roofs with those which have been employed in construction. The subject of No. 229 is "Elementary Decoration," by Mr. J. W. Facey, and the volume contains a surprising amount of useful hints and diagrams. In No. 230 Mr. Collings endeavours to explain the mysteries of handrailing according to a system devised by himself.

SIX ETCHINGS OF WELL-KNOWN VIEWS IN KENSINGTON GARDENS AND HYDE PARK. Etched on Copper from Nature by TRISTAM J. ELLIS. With a Descriptive Account by W. J. LOFTIE, B.A., F.S.A. Field & Tuer.

Hyde Park is the only park in England which may be called national: all others are local. But the natural beauties of the place have not been represented as truly as they deserve. The Park and Gardens afford so many subjects for the illustrations of periodical literature, it is supposed they are not adapted for a higher and more permanent form of art. That this is an error is seen from the fine etchings of Mr. Ellis. In them justice has been done to the noble trees, which cannot be matched in any Continental capital. The points of view have been in all cases well selected, and the etchings are picturesque without loss of accuracy. The greatest difficulty in representing Hyde Park arises from the necessity of introducing a number of figures, for the place is popularly associated with a crowd. A landscape artist cannot do justice to figures, and when a figure draughtsman is employed the co-operation is rarely successful. The men, women, and horses which appear in Mr. Ellis's etching of Rotten Row will not bear examination. They are, we suppose, to be accepted as conventionalisms, which could no more be omitted than the title of the plate. The series forms an interesting record of the Park and Gardens.

### ART WORKMANSHIP.

**Stained Glass.**—The east window of the chancel of the church of St. Stephen the Martyr, Avenue Road, St. John's Wood, has been filled with stained glass. The artist, Mr. W. G. Bailey, has treated the five lights with white Perpendicular glass, which well relieves the subjects. The Adoration of the Magi and the Shepherds fill the centre three lights, and the two remaining outer lights contain each two subjects—namely, the Annunciation and the Child Jesus in the Temple, and the Agony in the Garden and the three Marys at the Holy Sepulchre. In the tracery above are St. Stephen the Martyr, patron of the church; St. John the Baptist, patron of the district; and St. Paul the Apostle, patron of the See of London. At the foot of the window is the legend, "To the glory of God and in memory of Alfred Swaine Taylor, M.D. and F.R.S., and Caroline his wife, this window is erected by their daughter and son-in-law, Edith and Frederic Methold, A.D. 1882." The scheme of colour has been carefully studied, and is a very successful attempt to reconcile low sweet tones of quiet harmonious colours with the brightness and translucency required for a window. The effect during some parts of the day will be materially improved whenever the west window of the nave is also filled with stained glass, as the full glare of light through it now somewhat detracts from the delicate beauty of the new work.

### LEGAL.

**Supreme Court of Judicature.—Court of Appeal.—August 7.**  
(Before the MASTER OF THE ROLLS and Lords Justices BRETT and COTTON.)

ROBINSON v. THE LOCAL BOARD FOR THE DISTRICT OF BARTON, ECCLES, WINTON, AND MONTON.

"NEW STREETS."

This appeal from a decision of Mr. Justice Fry raised a question of some importance with reference to the powers of local boards with regard to "new streets"—viz., what is the meaning of the term "new street" in the Local Government Act of 1858, and the Public Health Act of 1875, and the bylaws made by the defendants in exercise of their statutory powers. Section 34 of the Act of 1858 provides that "every local board may make bylaws with respect to the following matters (*inter alia*):—(1) With respect to the level, width, and construction of new streets, and provisions for the sewerage through." Section 157 of the Act of 1875 gives the same powers "to every urban authority." Section 2 of the Public Health Act of 1848 (with which by section 4 of the Act of 1858 the latter Act is to be construed) provides that "the word 'street' shall apply to and include any highway (not being a turnpike road), and any road, public bridge (not being a county bridge), lane, footway, square, court, alley, passage, whether a thoroughfare or not, and the parts of any such highway, road, bridge, lane, footway, square, court, alley, or passage within the limits of any district." Section 4 of the Act of 1875 contains a similar definition of the word "street." There is at Patricroft, in the parish of Eccles, near Manchester, within the district of the defendant Board, a public highway called New Lane, which has existed for many years. New Lane is 885 yards in length, running in a direction nearly north and south, from the Liverpool Road to the Worsley Road. The plaintiff has agreed to take a lease for a long term of a plot of land on the west side of New Lane for building purposes. Eccles is about four miles from Manchester. Fifty years ago it was a small country village, but now it is a kind of suburb to Manchester. New Lane is not a turnpike road. It was formerly a country lane, with no well-defined footways, and it was usually repaired by having cinders thrown upon it. The Board have repaired it since the date of their formation, about the year 1850. Until the last ten years it was a cinder roadway, with no well-defined footways, and with grass growing at the sides. It has now a cindered footpath along the whole of both sides, except for a very short portion on the westerly side. The footpath on the easterly side was made by the Board in 1880; that on the westerly side in 1881. New Lane is repaired by the Board as a highway repairable by the inhabitants at large. In 1876 and 1877 the Board made a drive along the roadway, and in 1880 they channelled and paved it along the whole length and width. The population of the district has increased in the last ten years from 15,126 to 21,785, and the number of houses from 3,205 to 4,057, and one hundred new houses are now being built. On the west side of New Lane are twenty houses, some detached, others standing two, three, or four together. Of the land on the west side not actually built on, several plots, besides the plaintiff's, have been let for building purposes. On the east side there are sixty-seven houses, including a row of twelve cottages in course of erection, another row of sixteen cottages, a row of nine houses, another row of eight houses, another row of nine cottages, and another row of four cottages. Other land on the east side has been let for building purposes. The Board in 1871 made some bylaws as to the "level, width, and construction of new streets," and these bylaws were allowed by the Local Government Board on January 1, 1872. The first of these bylaws provided that "every new street shall be laid out and formed of such width and at such level as the Board shall in each case determine." Bylaw 36 required that every person should, before beginning to make or lay out any new street, give a month's notice in writing of his intention to the Board, and should leave with their surveyor certain plans and sections. Bylaw 37 made similar requirements with regard to every person who should intend to erect any new building. Bylaw 42 provided that the Board should approve or disapprove proposed new works or buildings within the times specified, and that the owner or person intending to erect any new street or building should give the notices thereby required, and if any owner or person should construct any works contrary to the provisions therein contained, the Board, after calling on such owner or person to show cause, might, if they should think fit, have such works removed, altered, or pulled down, as the case might require. The plaintiff gave notice to the Board of his intention to erect new buildings on his land, and left plans and sections at their office showing the intended building line of his proposed new buildings. The Board disapproved the proposed new buildings, on the ground that the houses would contravene the building line, and would be built within the line of the existing buildings on that side of the street, and they required the proposed building line to be thrown further back about ten yards from the roadway of New Lane. The plaintiff commenced to build according to his plans, and the Board called on him to show cause why his works should not be removed. The plaintiff disputed the right of the Board to disapprove of his plans on the ground that

his intended building line was too near the roadway, or to pull down his new buildings if erected in accordance with his plans. This action was brought to restrain the Board from doing what they proposed to do, and a special case was then stated for the opinion of the Court, whether New Lane was a "new street" within the meaning of the Acts, and whether the Board were entitled to disapprove of the plaintiff's proposed new buildings on the ground stated, or to pull down his new buildings.

Mr. Justice Fry held that the term "new street" in the Acts applied only to a street constructed for the first time out of grass land or other vacant land, and not to an old country road in the neighbourhood of a town, which, by the building of houses on each side of it, had become, or was gradually becoming, a street, and consequently that New Lane was not a "new street," and that the Board had no power to disapprove or to pull down the plaintiff's new buildings. The Board appealed.

The Master of the Rolls could not say that the Act was not fairly open to more than one construction. The case was a very difficult one, and was fairly open to a difference of opinion. But regard must be had to what must be presumed to have been the intention of the Legislature. The intention must have been to give to a local authority the power of regulating the laying out of new streets—a power to be exercised for the public benefit. What was the meaning of the term "new street?" His lordship should say it meant a street where there was no street before, though it might include more. This might take place in one of two ways. A street might be made out of a grass field, and, in his lordship's view, it would make no difference whether or not an old country lane or road was thrown into it. In such a case as this a person who designed to build houses along the street was to build them in a particular way, and subject to the bylaws of the Board. But then there was another case, where the street was not laid out in a formal way, but, so to speak, grew of itself. When did it become a street? At some time or other it must do so. But when? You could not tell unless you knew the locality. It was a question of fact in each case. Section 157 of the Act of 1875 plainly empowered the Board to make bylaws before the street was made, and the moment the street became a "new street" it was subject to the bylaws. Upon the facts of the present case his lordship thought there could be no doubt that New Lane was a "new street." It was a very young street indeed. On the east side, opposite to the plaintiff's land, there was a continuous line of houses, extending beyond his land on either side. The Board had in substance called on the plaintiff to build the street of a certain width. He was laying out a "new street," building a continuous line of houses. His lordship was satisfied that the defendants were acting within their powers, and the appeal must succeed.

Lord Justice Brett and Lord Justice Cotton delivered judgment to the same effect.

#### Queen's Bench Division.—August 9.

(Before Lord COLERIDGE.)

BRADWELL v. EARL OF KILMOREY.

A BUILDER'S ACCOUNT.

An application in this case was made by Mr. Grain on behalf of the plaintiff for judgment for 1,982*l.*, with costs, upon the report of the official referee. The action was one brought by a builder to recover a sum of 3,000*l.*, as certified by the architect employed by the defendant to be due to the plaintiff for work done at the St. James's Theatre. The defence as to this amount had been that it was exorbitant, and the official referee had indeed reduced it by about one-third. As to a counterclaim by the defendant for a large sum as representing the losses incurred by him through the plaintiff's delay in completing the alterations to the theatre—firstly, within a reasonable time before February 1879; and secondly, within a time named subsequently in a written agreement between the parties, viz. April 10, 1879—the official referee found that the defendant was entitled to only nominal damages, and awarded him 40*s.*

Mr. Maloney, for defendant, sought to show that the award of such 40*s.* had been made by the official referee on a wrong principle. The theatre, which is now let to Messrs. Hare & Kendal for nine years, had, as he contended, had a letting value from April to September 1879, and this the defendant had lost from the breach of their contract to complete the repairs by April 10 by the defendant. The defendant was therefore entitled to more than the nominal damages awarded him by Mr. Dowdeswell, Q.C., the official referee. For the short season of May, June, and July 1879 the defendant might have obtained quite 1,000*l.* as rent.

Lord Coleridge said that it had been only in deference to the urgency with which he had been pressed by the learned counsel for the defendant to send the case back to the official referee, that he might state his reasons for his award, that he (the learned Judge) had consented to do so. The official referee had gone fully and carefully into those reasons, and it was quite clear that his award was a perfectly proper one. The plaintiff would have judgment on his claim for 1,982*l.* and costs, and the defendant on the counterclaim judgment for 40*s.*, but without costs, except such as had been improperly thrown away by the defendant in resisting

the application to send the counterclaim to the official referee. There would be a special order that the taxation of the costs should be proceeded with at once, and there would be no stay of execution granted.

#### CHURCH BUILDING AND RESTORATION.

**Beedon.**—The church of St. Nicholas has been re-opened after restoration, which has been carried out under the direction of Mr. E. Dolby, architect. The alterations have as far as possible been made in a style to accord with that of the original architecture, which is Transition Norman. The nave and chancel having been stripped of their tiles, the roofs have been soundly repaired with oak and the tiles re-laid. The west wall, which was considerably out of the perpendicular, has been straightened without being pulled down, and an unsightly brick porch has been replaced by one of massive oak. The walls generally have been repaired where necessary. A new bell cot has been erected, supported by massive timber framing rising from the floor of the church. The nave has been seated with oak benches on a floor of wooden blocks, and the aisle has been laid with red bricks in patterns. In the chancel what is believed to be the restoration of an old feature has been supplied—viz., a ceiling of oak with carved oak bosses. The floor has been laid with glazed tiles specially designed by the architect, and manufactured by Mr. Godwin, of Lugwardine. New oak chancel seats have been put in; and the three east window lights have been filled with stained glass by Messrs. Heaton, Butler & Bayne.

**Cullercoats.**—The Duke of Northumberland laid the foundation-stone of St. George's Church on the 4th inst. His Grace has given the site, and undertakes the entire cost of the building, which, it is estimated, will amount to about 18,000*l.*; he has also given the site for a vicarage house, and, jointly with the Ecclesiastical Commissioners, has provided an endowment to the amount of 300*l.* a year. In style the church will be of thirteenth-century character. It will consist of a nave enclosing an area of 84 feet by 56 feet, with western narthex treated as a baptistery, and entered by porches on the north and south sides. The chancel, with apsidal eastern termination, will be 50 feet long and 21 feet wide. A tower, in which it is proposed to place the organ, will be south of the western bay of the chancel; and the corresponding position on the north side of the chancel will be occupied by a transept about 20 feet square, with a large vestry west of it. The total length of the church from east to west will be 158 feet, and the greatest breadth from north to south about 90 feet. The church is to be built entirely and faced inside and outside with local stone. The nave and aisles will be divided into five equal bays, and separated by simple arcades with circular columns and plain moulded arches. There will also be a narrow triforium, not pierced, and a lofty clerestory, with windows of two lights. The external surface of the clerestory walls will be unbroken, and the bays will be marked by buttresses on the aisle walls, with a single lancet window in the centre of each bay. The narthex will be groined over about 12 feet above the nave floor, and the nave, clerestory, triforium, &c., continued over it, thus giving the effect of an internal porch, over which will be seen the west windows of three lights each, and 22 feet high, and almost the whole width of gable. This gable will have angular turrets, corbel course, and circular window over to light the roof. The nave and aisles (as well as the rest of the church), will be groined with plain quadripartite groining, with a timber roof over of steep pitch. The height inside will be 44 feet, and to the point of ridge 20 feet higher. The chancel, including the apse, will be divided internally and externally into nine bays by upright shafts; externally the walls will be plain up to the level of the sills of the windows 25 feet above the floor. These windows will be of two lights, with blank arches on either side, thus giving the effect of a continuous arcade. A tall wall arcade will surround the chancel at the floor level. The blank triforium of nave will be continued round, and the clerestory windows will be widely splayed, so as to completely fill each bay. Lofty arches will open into the tower on the south, and into the transept on the north. The transept gable will be filled by a large four-light window, and a three-light window will light the lowest stage of the tower. The tower will rise to a height of 90 feet, and will be covered by a broach spire of about the same elevation, with one tier of spire lights only. The belfry windows will be long louvered windows of two lights, with transoms. The passage ways are to be paved with tiles, the chancel floor being a little more enriched than the rest. Under the seats the floors will be wood. The church will be seated with open benches in oak, and will have all the usual furniture and fittings of appropriate design. The church is being built from plans prepared by and under the superintendence of Mr. J. Pearson, R.A. The whole of the works are being executed by Mr. Walter Scott, Newcastle.

**Manchester Diocese.**—A sitting of the Manchester Consistory Court was held on the 4th inst., when faculties were decreed for rebuilding Christ Church, Walmersley, and for building a choir vestry and opening a window in the bell tower in connection with Holy Trinity Church, Habergham Eaves. An application was also made for a faculty to make certain alterations and improvements

in St. Mark's Church, Worsley, including a low old oak screen, altering staircase to pulpit, new chancel floor—marble, mosaic, and tiles—new marble steps and altar pace, removing the Earl of Ellesmere's stalls into the private chapel, and putting new choir stalls of oak in chancel, new chancel aisle for vestries, and removing organ to same, and making good the stalls in the church when organ and choir are removed. The consent of the Earl of Ellesmere to the changes affecting his rights having been obtained, a faculty was decreed as prayed. The vicar of Christ Church, Ainsworth, made a first application for permission to erect a small vestry on the south side of the chancel, and for removing the organ from the west gallery to the floor of the north transept, for removing the pulpit from the south to the north side of the chancel, and bringing over the reading desk to the south side. An application was also made for a faculty in reference to St. James's Church, Ashworth, to take up the old pews and replace them by sittings of a more convenient and modern kind, put in new heating apparatus, construct a new reading desk and make the present one into a pulpit, the present pulpit having fallen in from decay. A faculty was decreed in this case also, subject to a plan being brought in showing the final arrangements for the choir seats and pulpit.

### NEW BUILDINGS.

**Cardiff.**—The old public-houses and the book-shop by the Town-hall have been removed, and the site is occupied by a new building erected for the London and Provincial Banking Company, which takes the leading position among similar structures in the Principality. This building, which is partly in the Italian style—three storeys high with basement—is built with local brick, faced with Bath stone, with French rusticated ashlar courses, in three stages, each stage being marked by richly-moulded entablatures, with carved enrichments, and flanked with pilasters on front and side elevations, between which are windows, deeply-moulded dressings, balconettes, and balustrades. The building is covered with a high-pitched roof. The basement is built of massive masonry in blocks of extra thickness, closely set, lined with vitreified white brick, and arched over in brick and cement, with massive iron fireproof doors where necessary. The basement and the several storeys of the building are arched in brick and cement, on wrought-iron girders, which form the several floors, and cased over with pitch-pine flooring, rendering the whole building fireproof. The principal staircase, which is constructed of moulded Forest of Dean stone and ornamental cast-iron balusters, is lighted by a lantern light in the roof, which assists in the ventilation of the building. The building has been erected by Mr. Lock, builder, from the designs of Mr. W. D. Bleesley, architect, Cardiff. In the same street a building for the South Wales Dairy Company was opened last week. It was also designed by Mr. Bleesley and is in the Renaissance style, three storeys high, with basement built of rubble masonry, and faced with Bath stone. Each storey is marked by a richly-moulded entablature, carved and supported on cluster columns and pilasters, with rich foliage, caps, and bases, and divides the entire front into three bays. A building corresponding in style is also in course of erection from Mr. Bleesley's designs.

**Manchester.**—The works in connection with the new passenger station which the London and North-Western Railway Company are erecting at Hunt's Bank are making rapid progress. Built, as the station will be, entirely upon arches, and abutting upon the river Irwell, engineering difficulties of no inconsiderable character have presented themselves, but these have been successfully surmounted. The station itself will cover an area of about five and a half acres. Some of the platforms are now in course of construction, and the foundations for the iron columns supporting the roof are being prepared. The station itself will be covered by three iron spans, filled in with glass, and supported upon iron columns. There will be three main platforms, each of the length of 230 yards, and of varying width, with the necessary roadways for cabs, &c. The waiting-rooms, booking-offices, refreshment-rooms, and various other offices will be at the principal entrance to the station, opposite Victoria Street, and will extend round the corner to the east end of the structure, covering a length of 360 feet. The work is being carried out from the plans of Mr. Francis Stevenson, the company's engineer-in-chief, Mr. W. B. Worthington being the resident engineer. Messrs. R. Neill & Son are the contractors.

**Leeds Coliseum.**—The foundation-stone of this building was laid on Saturday by Sir Andrew Fairbairn, M.P. The new building is being constructed by the Coliseum Buildings and Offices Company (Limited), and will be suitable for the holding of public meetings, entertainments, amateur theatricals, and religious gatherings, or for a circus. It will be constructed in the form of an amphitheatre, and will hold 5,000 persons. Sitting accommodation will be provided for 3,500 people. The façade will be built of stone, and the roof will be in one span formed by a laminated rib. There will be two galleries, the approaches to which will be by fireproof staircases. Stables will also be erected in proximity to the Coliseum. The building is estimated to cost 12,000*l.* The

contractors are Messrs. Franks & Evans, excavators, bricklayers, masons, and plasterers; Messrs. Craven & Umpleby, carpenters and joiners; Mr. Geo. Thompson, plumber; Messrs. J. & W. Atkinson, slaters; Messrs. Nelson & Sons, ironmongers; Messrs. Walsh & Sons, painters. The building will be erected from plans prepared by Mr. Bakewell, architect.

### SCHOOL BUILDINGS.

**Glasgow.**—The new schools in Albert Road, Pollokshields, were opened on Monday. Advantage has been taken of a difference of level in the streets to get a covered playground under one-half of the building, and this has been of great service in increasing the size of playgrounds, and also obtaining greater than usual proportion of shelter. The building is two storeys high, and of square plan, measuring 82 feet by 75 feet. The separate stairs for boys and girls are combined on a novel plan, which gives spacious appearance and completely separate access to all the departments, the whole being at the same time under the view of the master from any point. The school will accommodate 850 scholars at the increased space now required by the Education Department, and the cost will be under the 10*l.* per child limit of the Government. The architects are Messrs. H. & D. Barclay.

### ENGINEERING WORKS.

**South Staffordshire Drainage.**—The iron and coal masters of the South Staffordshire district are earnestly discussing the prospects of the South Staffordshire Mines Drainage Commission. Its ability to do the work for which it was appointed is being questioned, and a failure would result in the drowning out of the district, and enormous losses in the coal and iron trades. The matter was brought up at the monthly meeting of the Commission. Mr. Walter Bassano, of the Old Hill district, declared that the Commission had frittered away between 130,000*l.* and 140,000*l.*, and had done nothing like the work that might have been done. The system upon which the drainage had been conducted was simply pumping the same water over and over again out of mines to which it was constantly returning. The Old Hill district had been drained at last, but not until a debt of 30,000*l.* had been incurred. One-half of the Tipton district was still under water. The Commission had just obtained security for further capital of 25,000*l.* or 30,000*l.* They could not afford, for their own credit's sake, to ask for more money. They must look upon this sum as all they now had left. Unless some radical change were made in the executive, this money would be frittered away like the rest. The pumps would have to be stopped, the mines would be flooded, the iron and coal industry paralysed, and the Commission—containing presumably the pick of South Staffordshire for men of standing and ability—be eternally disgraced. The Commission never had worked harmoniously as a body. Party spirit and jealousies had characterised its dealings. The only remedy was to vest the executive in one able man, if possible independent of the district—whether paid or unpaid—who should be recognised as the supreme head.

### GENERAL.

**Mr. J. E. Boehm, R.A.**, has been awarded the gold medal for sculpture at the Vienna International Art Exhibition.

**Mr. Millais, R.A.**, has taken the Murthly Moor, in the Aberfeldy district, for the season.

**The Design** of Mr. E. H. Bruton, A.R.I.B.A., of Cardiff, has been adopted for the new Institute of the Blind, Cardiff. The second premium was awarded to Mr. E. M. B. Vaughan.

**An Exhibition** of Art and Industry was opened at Crieff on Monday by Lord Aveland.

**The New Buildings** to be erected in Winnipeg, Canada, are expected to cost five millions of dollars. The Grand Canadian Pacific Hotel is being erected at a cost of 500,000 dollars.

**A Statue of Mr. Gladstone**, by Mr. A. B. Joy, was unveiled at Bow on Wednesday by Lord Carlingford. It stands in the centre of the roadway near the parish church, and has been presented by Mr. T. H. Bryant.

**A Conservative Club** has been opened in Blackburn Street, Bolton. It was erected from designs by Mr. R. Knill Freeman.

**The Members** of the London and Middlesex Archæological Society will visit Silchester on Thursday, when Mr. Price will conduct them over the ground. Mr. J. Parker and the Rev. T. Langshaw have promised assistance.

**Mr. Frank Matcham's** plans for the reconstruction of the Philharmonic Theatre at Islington have been passed without alteration by the Metropolitan Board of Works and the Lord Chamberlain. The work is to be commenced forthwith.

**Mr. R. H. Hodgson**, of Workington, has obtained the contract for the erection of the new steel works for Messrs. Cammell & Co. at Workington. The contract amount is about 50,000*l.*, and it is expected that operations will be commenced next week.

# The Architect.

## WHAT WE WILL DO WITH THE DUKE.

SIR HENRY HOLLAND, M.P., must be not only sympathised with, but cordially excused, if he felt himself unequal to the task of answering all in a moment Mr. GLADSTONE'S startling question, "What he would do with the Duke if he got him down?" The honourable member does not profess the particular knowledge or skill by means of which a question so insidious, and at the same time so insidious, could be answered by any one, in the House or out of it—say by Lord ELCHO, or Mr. BERESFORD HOPE, or Sir EDMUND BECKETT. Even Mr. SHAW LEFEVRE, who in a certain sense is the maintainer, upholder, sustainer, and keeper of the Duke, would scarcely trust himself to say "what he would do with him if he got him down," until at least he had obtained a full and sufficient report upon the subject from the wisest advisers of his Office. Sir JAMES MCGAREL HOGG, in like manner, would not be able to say a word upon so important and delicate a subject until a vote had been taken at his Board. Even the "Members of Council" or Brahmins of the Royal Institute of British Architects might hesitate, and indeed be allowed to differ a little amongst themselves, before returning a reply to the PRIME MINISTER'S demand; and perhaps Mr. President HORACE JONES himself, with whom the First Commissioner appears to be on such sarcastic terms of respect, might prove to be more unequal to the occasion than of late he seems usually to have been.

The Duke in question is of course that magnificent work of art the Bronze Duke, cocked hat and feather, cloak, baton, and charger, now surmounting the Triumphal Arch at Hyde Park Corner—surmounting it like an Old Man of the Sea, misappropriating it, squashing it, choking it, exasperating it, turning it into ridicule, and in general turning itself into a disreputable joke as well; and all this simply because it is a good thing in a bad place—we are only sorry we cannot say so very good a thing as we can conscientiously say so very bad a place. Sir HENRY HOLLAND took no greater liberty with the Government than to express a hope that, when once brought down to the level of the ground, the Duke would not be hoisted up again to the level of the chimneys; and it was in acknowledgment of this guileless and humble trust that the Premier, like jesting PILATE of old, put his puzzling question and did not wait for an answer.

It is a standing rule with young and indeed middle-aged people of even the most modest culture, when first privileged to behold the great equestrian statue of the Duke of WELLINGTON on the Arch, to "wonder how the dickens it got there." It is not the policy of our journal to join in the cry which is often somewhat carelessly and thoughtlessly raised against metropolitan statuary; neither do we deem it at all necessary to despise this statue in particular, whose merits evil fortune for the last five or six and thirty years has displayed to such singular disadvantage; but we will endeavour to recall the facts connected with its unhappy imposition upon its most inappropriate pedestal, as some of our readers who are getting on in years will no doubt remember them.

Mr. MATTHEW WYATT was the sculptor employed to design a heroic portrait statue of the illustrious Field Marshal, then very old and very much honoured by all the world. It was duly modelled, duly approved in the studio, and duly cast in the metal of captured guns. We cannot recollect how far the artist had been expressly instructed so to design it as to accord with Mr. DECIMUS BURTON'S massive and graceful Arch as a pedestal, but when the time came that the public were informed of the intention to place it thereon a universal shout arose of indignation and scorn. It was quite characteristic of the English practice of the art "how not to do it" that the Triumphal Arch should be seized upon with avidity by those who were in charge of so big an image, as a pedestal which not only was big enough, and not only was cheap enough (that is to say costing nothing), but was appropriately situated just under the nose of the living hero as he

sat at his parlour window. The architect of the Arch firmly protested against the measure; the press and the public laughed consumedly at an artistic absurdity too palpable to be mistaken; the sculptor, however, insisted that he would have that very pedestal and no other; the Government authorities confessed themselves at a nonplus; and the veteran original of the effigy was therefore at last appealed to. Having already one heroic image dedicated to his honour constantly before his shrewd and sensible eyes at the back of his house, and being a man of no childish vanity and no inconvenient amount of taste, it was confidently expected that the Iron Duke would express an opinion that the bronze one might be better bestowed elsewhere, and many excellent people thought the thing was as good as so settled. But, like the diplomatists at Vienna, they had altogether misconceived the veteran's character. They forgot how very much of a soldier he still was. The old gentleman, whose reply to the lady who wondered how he could turn on so very narrow a bed was only that "when one wanted to turn, madam, it was time to turn out," with equal simplicity and modesty contented himself now with inquiring what had been the orders; to which the sculptor answering that he had been promised the Arch for his pedestal and claimed the fulfilment of the promise, what could the warrior do but declare in his favour? If Mr. WYATT'S perversity had happened to go so far as to demand the fulfilment of a promise that the effigy should stand—perhaps more appropriately—on its head, the Duke would doubtless have ordained also that stand on its head it should. As for himself, as he very probably explained, he was a perfectly impartial arbitrator; one place would do as well as another, and indeed one image as well as another, or no image at all as well as the best; but orders were orders and a bargain was a bargain. So the big horse and his rider were slung up by means of the proper mechanical powers, amidst the ridicule of all nations; and there up to the time present they have remained.

It having been resolved now to remove the Arch to another spot, of course it is necessary, as a preparatory measure, to lift off the ornament; and all rational people have been taking it for granted that even the chronic fatuity in art matters of an English Government would never go so far as to restore it to its perch on the new site. It is suggested that the edifice should be moved in the American manner, by being made to walk down Constitution Hill on centipedal screw-jacks; and, if we understand Mr. SHAW-LEFEVRE'S remarks, he would almost like to see the Duke—perhaps for the fun of the thing—riding on his pedestal all the way; so that it was in connection with this happy thought that Sir HENRY HOLLAND hinted his objection, and was met with the Ministerial challenge to say what was to be done with the ludicrously-disposed centaur if it and its pedestal were at length to part company. To this question, in artistic seriousness, not an inquisitive and hesitating member of Parliament perhaps, but the recognised artistic authorities of the public, must now furnish a proper answer.

Given the statue by itself, and supposing it had never been put where it is, how ought it to be provided with a fit and appropriate pedestal? It shall be our present purpose not to advocate any particular plan, but to remind our readers of general principles, and by way of commencement to repeat once more the oft-repeated argument of five-and-thirty years ago, that on no principle whatever—except the wanton repudiation of all principle—ought it to be perched as an ornament on the roof of a Triumphal Arch.

A statue of that character and size, even if it had many more gross faults than it has recognisable merits, is worthy of having a pedestal expressly designed for it. There is no lack of examples in point, although of course few of them are to be found in England. The purpose of design would be to accept the dignified motive of the statue, and emphasise it; not merely to give it vulgar prominence, or to enhance the effect of its magnitude, as some superficial critics might say, but to follow up the effect of grandeur and give it force; to accommodate to the surroundings, also, and to the sympathies of observers, the characteristics of the sculpture—the purpose, the attitude, the outline, the mass, in a word the whole idiosyncrasy of the work of art—with all its peculiarities, as legitimate factors of artistic effect.

The first question is whether to have a high pedestal or a low one. The artistic answer is that the skilful architect can design with equal facility either the one or the other; but it is not improbable, nevertheless, that a good deal of diversity of

opinion may prevail on this preliminary point. There are certain features in the design of the statue, and especially of the horse, which, when it reaches the ground again, may be held imperatively to require an elevated position. It may also be argued that a pedestal as lofty as itself, or even loftier, is academically essential to the dignity of a figure on so large a scale. On the other hand it is equally fair to urge that the majesty of scale may be better developed more on the level of the eye, and that a wide-spreading base with an inconsiderable altitude would be found more truly grand than a massive academical substructure, imposing in itself, but probably tending to dwarf the figure.

In either case the desirability of introducing supplementary figures comes to be a question of importance; and here many good authorities may advise *in limine* that nothing of the sort should be allowed to interfere at all with the simple majesty which the heroic group can best sustain in the calm repose of its solitary stateliness.

Whether a site should be selected in the open thoroughfare or in the more secluded park is another point for consideration. One thing may certainly be said here, that a confined situation would be unsuitable, and that to set up so large a figure on a narrow rectangular block, like so many of our English equestrian statues, would be little better than to restore it to the bad eminence of the Arch.

The urgency of Mr. WYATT in insisting upon so lofty an elevation awakens a suspicion that he may have been conscious of a certain coarseness of detail in his work, which, in fact, most observers fancy they perceive even at the height at which it is placed now. This, however, as we think, if it should be the fact, ought scarcely to be too readily accepted as a reason for removing the statue to a distance from the eye; it is quite within the resources of skill to adapt the design of a pedestal to this characteristic, and even to render it an element of masterly vigour.

Neither should we be disposed to admit that the sculptor had modelled his figures for the special foreshortening of an elevated position; even if this were positively asserted, there are many reasons for disregarding the assertion.

On the whole we will venture to express the hope that, as a mere act of common-sense, the opportunity will now be embraced of getting the Duke down to the ground for careful examination, and of considering thoroughly *de novo* what it is best to do with him for the interest of art and the substitution of even partial honour for universal ridicule.

#### PROPOSED EXCAVATIONS AT EPHEBUS.

THE success which in recent years has attended the Germans in their exploration of Pergamum, the Americans at Assos in the Troad, and the French at Delos—to mention only some of the principal events—has served to draw attention to the fact that in this line of research England, which used to be foremost, is now lagging behind. No one feels this more than Mr. WOOD, who knows that when excavations at Ephesus were stopped some years ago a considerable part of the work remained to be done. He had cleared the actual site of the famous Temple of DIANA, which he found under about 20 feet of alluvial soil. In the way of sculpture very little was obtained, and among several theories to account for its scarcity, a not unreasonable one is that in the fall of the temple the sculptures on the upper part of it—assuming that there were such sculptures—would be projected to some distance on all sides. To confirm or refute this view of the case it would be necessary to clear away on all sides the soil which now, like a great wall, shuts in the site of the temple. That is what Mr. WOOD, as we understand, proposes to do. The expense would be great, and the Government having declined to proceed any further in the matter, he now appeals through the Mansion House for public subscriptions. When it is a question of charity there can be no better channel of appeal. In archaeology, however, we are by no means starving just at present. Indeed, so great has been the increase of new material of late that we may rather be said to be overfed.

On the other hand, our right to revive the excavations at Ephesus may not last much longer. Add to this that Mr. WOOD offers his services, and we have at the present moment a conjunction of advantages which, it would seem, should not be neglected. He has had a long experience on the spot, longer perhaps than was necessary. But the problem is dif-

ferent now. There is, in fact, no problem at all. It is merely a question of clearing away the soil round the temple, and so far there is no need of any special skill. It is only in the case of sculptures or architectural members being found that the presence of an experienced architect is required, and in this respect we cannot say that Mr. WOOD—to judge by the book which he published giving the result of his excavations—displayed a talent. There is, however, no absolute need for associating the proposed excavations with him. It is natural for him to desire to complete what he had already carried so far, but we do not know that the subscriptions are invited for this particular purpose.

The Temple of DIANA at Ephesus was known at a late period of antiquity as one of the wonders of the world, and in many ways it may have deserved this title, as, for instance, with reference to the things it contained, a mere catalogue of which would, according to an ancient writer, have filled volumes. But it was not for the high style of its sculpture, if we may judge from the examples now in the British Museum. Such at least would be the judgment now. In late antiquity, doubtless, taste was different, as indeed the sculptures of Ephesus themselves prove, since there is every reason to suppose that for so rich a temple the best artistic skill of the time would be sought. In that case the best artistic skill of Ephesus was on much the same level as that of Pergamum when EUMENES or ATTALUS erected the great altar, and caused it to be adorned with the sculptures which have now found a resting-place in Berlin. That was about the beginning of the second century B.C. Hitherto it has been usual to assign the Ephesian sculptures to the lifetime of ALEXANDER the Great, on the ground mainly that he when at Ephesus asked leave to dedicate the temple. From this, however, it does not follow that the building was then complete; it may even have advanced only a little. At all events, the comparison with the sculptures of Pergamum is so striking that we cannot well avoid holding the date which is good for them to be good also for those of Ephesus, or at least nearly so. About the middle of the third century B.C. would be near the mark.

At Pergamum the base of the great altar is decorated with bas-reliefs on a colossal scale, and though we may admire to some extent the knowledge, training, and boldness of the artist, we are at the same time depressed with the absence of refinement, or even of careful thinking, both in regard to the execution and in the conception of the design. These sculptures, though exhibiting much cleverness, are essentially coarse, and as such agree very well with the spirit of the times in which they were produced. At Ephesus we have again a prevalence of bas-relief, and it will afford an instructive comparison with the sculptures of Pergamum if the large blocks which Mr. WOOD mistakenly assigned to the frieze should in the end prove to belong to the base of the temple. There is already no doubt that they supported columns; the marks made by the drip from the base of the columns are visible on the top of the blocks, and we believe it was Mr. FERGUSSON's view, in a paper communicated to the Institute, that the blocks formed great plinths or piers, each supporting one of those sculptured columns of which several drums were found by Mr. WOOD. To suppose that the base of the temple was sculptured in relief, and that access was obtained only by steps at each end, and these not extending across the whole breadth, would [be in itself a reasonable deduction from the actual facts; it is confirmed, as we have said, by the results of the German excavations at Pergamum. However this point may be settled, the comparison between the sculptures of the two places is a matter on which there need be no doubt. At Ephesus, as at Pergamum, we have the same knowledge and technical skill, the same desire for picturesque effect, which probably was at the bottom of the great preference for bas-relief in both places; the same sleight of hand, and the same incapacity of mind to catch a spark of true invention. This applies even to the much-praised and much-discussed sculptured drum, on which the figure of HERMES may to some extent be admired as indicating technical knowledge and a limited artistic power; while, on the other hand, the female figure before him is merely a scheme of drapery, under which there is no form, or, what is worse, next to no form. Yet this drum is greatly in advance of the sculptured blocks of which we have spoken. There coarseness reigns supreme, and without rival even in Pergamum.

It may be said, then, that if it is more of this kind of sculpture that Mr. WOOD expects to find, there is no

occasion to wish him any great success. In this, however, we do not agree, because there are many interesting problems still to be solved in regard to the later ages of Greek art, and especially in regard to the art of the third century B.C. Not only that, but, as has already been indicated, not a few questions remain concerning the Temple of DIANA itself which an extension of the excavations might reasonably be expected to settle, or go some way towards settling. Besides, it is always possible that in the immediate neighbourhood of the great temple there had been lesser buildings, and perhaps also sculptures, which had survived from older times. But of this the probability is not very great, since the fire—which, according to tradition, occurred on the night when ALEXANDER was born—appears to have destroyed the temple, and doubtless had involved the neighbouring structures in its ruin. The most interesting pieces of sculpture obtained by Mr. Wood were fragments from the older temple, and showed evident marks of fire. They were found under the later building, and if by new excavations more of them could be brought to light a very important service would be rendered.

### GAS AND ELECTRIC LIGHTING.

THE report just published by Lieut.-Colonel Festing, R.E., the assistant director specially entrusted with the charge of the museum buildings, South Kensington, including lighting, heating, ventilation, &c., states that during the past year the consumption of gas at South Kensington shows a decrease as compared with 1880 of 3,151,200 feet, costing at present prices 498*l.* 18*s.* 10*d.*, and as compared with 1879 of 5,381,300 feet, costing 852*l.* This decrease is attributable to the extension of the use of the electric light. Since May a second 16-light Brush machine has been at work, and the Raphael and Sheepshanks rooms are now lighted, as well as the Lord President's court. An alteration of the method of hanging the lamps in the latter has been carried out on one side, and, being found satisfactory, is now being applied to the other side; at the same time it is found advisable to raise the lamps a little, so as to get them more above the level of the eye of people in the galleries, and to add two lamps to each side. The disposition of the lamps will therefore be as follows:—Lord President's Court, 20 lamps; Sheepshanks Galleries, six lamps; Raphael Gallery six lamps; total 32 lamps. The expectation of an economy in working if two machines were driven by the engine has been amply borne out. With the two machines and 32 lamps the indicated horse-power of the engine is 38, and the consumption of coal per hour of work, a fraction under 112 lbs., as against 81 lbs. last year, when there were only 16 lamps. There has been also considerable economy in wages, as the only addition to this head has been for the trimming the additional number of lamps. Up to the end of the year the thirty-two lamps had been at work for nearly six months, or 346 hours of lighting. The cost of working has been as follows:—Carbons per hour, 2*s.* (per lamp per hour, 76*d.*); coal per hour, 10½*d.* (per lamp per hour, 33*d.*); oil per hour, 5½*d.* (per lamp per hour, 17*d.*); wages, per hour, 2*s.* 6*d.* (per lamp per hour, 94*d.*)—making a total per hour of 5*s.* 10¼*d.* (per lamp per hour, 22*d.*).

The consumption of gas in the same space would have been 8,600 cubic feet per hour, costing at the present price 1*l.* 7*s.* 2½*d.* The saving in working expenses is therefore 1*l.* 1*s.* 4½*d.* an hour, or at the rate of nearly 750*l.* a year, or more than 23*l.* per lamp per year.

It is interesting to compare with the results of working two machines with a steam engine here, those of working one machine and fourteen lamps with a twelve horse-power gas engine at Jermyn Street. The lamps there are lighted for a little over 400 hours in the year, and from one year's experience the hourly cost of the light is found to be as follows:—Carbons, 10½*d.*; gas for engine; 340 feet at 3*s.* 11*d.*, 1*s.* 4*d.*; oil, &c., 4*d.*; wages, 1*s.* 6*d.*—total, 4*s.* 0½*d.*

This gives a cost of 3½*d.* per lamp per hour. Of the 14 lamps, three are in places not hitherto lighted in the evening. The consumption of gas in the Museum was at the rate of 2,100 feet, costing 8*s.* 3*d.* per hour, the gas being of the quality known as "20 candles." The cost of 11 electric lamps representing this gas is 3*s.* 2*d.* per hour. The outlay on the installation, including motive power, machines and lamps, and a rather more ornamental treatment of the latter than has been attempted so far, may be estimated at 70*l.* per lamp, on which the annual saving on working expenses as determined at South Kensington will represent 33 per cent. This, however, necessarily depends upon the price of gas and the quantity of gas which each lamp replaces, and it is not possible always to arrange the lamps so that each may replace its full equivalent of gas. For some months the temporary reading-room of the Art Library has been lighted by Lane-Fox incandescent lights with very satisfactory results. The room is 50 feet by 20 and 18 feet high. Twelve Lane-Fox lamps replaced 15 Sugg's argand gas burners. The current is supplied by a "Brush" machine

driven by the gas-engine. This small experiment does not give much information as to the cost of this system of lighting, as the lights take only a small portion of the power of the machine. There seems to be little doubt, however, that the working expenses of lighting with incandescent lamps is about the same as the cost of gas burnt in the best argand burners. It is evident that no fumes can be produced by an incandescent lamp, as the heated carbon filament is enclosed in a glass globe which is hermetically sealed. For the same reason the only way in which heat is given off is by radiation. From a somewhat rough test with a thermopile it is found that the quantity of radiant heat given off by a Lane-Fox lamp is, for equal light, in the proportion of about one-sixth that emitted from a good argand gas burner (Sugg's "London"). It should be borne in mind that the radiant is but a small portion of the whole heat produced by a gas flame, the chief part of which passes away in the heated fumes. It is possible to remove these fumes from the room by pipes; and even if this be perfectly accomplished the incandescent electric light will have the advantage of giving only one-sixth part of the heat. But the difficulty of applying these pipes is in many cases very great, and they are necessarily expensive and ugly. The light of these lamps is almost as yellow as that of gas, which renders it unsuitable for cases where colour has to be carefully studied, and it was not found to answer for the life room in the art schools when a trial was made of it. The Brush (arc) light has also been tried, and as to colour was found very satisfactory. The heat given out is, in proportion to the light, considerably less than in the case of incandescent lights; but the unsteadiness was at times very great. It is hoped, however, to be able to correct this defect to some extent in some lamps which will shortly be put in the schools.

### ART LIBRARY AT SOUTH KENSINGTON.

THE report by Mr. R. H. Soden Smith, F.S.A., the Keeper of the National Art Library, has been published. He says that the attendance in the Art Library during the past year has decreased, the numbers being 25,462 against 27,339 in 1880, a large increase having then occurred over 1879. The numbers for 1879 were 25,453, a total which it will be noticed is nearly the same as that of last year. The portion of the structure for the new library which forms the reading-room is now ready to receive its internal fittings; the rooms in which a large portion of the collection must ultimately be kept are not yet commenced. The new reading-room, lighted from the top and from the north, is calculated, when completed, to give good accommodation to 180 readers. The number of volumes acquired has been 1,215. Among the works presented the most important is the great work on the Antiquities of the Russian Empire, consisting of six volumes of text and six volumes folio of elaborate illustrations; this costly publication was presented through the Director by the Russian Government; also from the same source, "L'Ornement National Russe, avec texte de W. Stasoff;" and another work on Russian Ornament in five parts folio. There may also be mentioned: four volumes on the Coins and Medals of Portugal and on the Roman examples in the Royal Cabinet by Senhor A. C. Teixeira de Aragão, presented by the author; "Artillerie, c'est à dire vraye instruction de l'artillerie, par D. Ufano," sm. folio, 1621, and "Traicte des Chiffres, &c., par Blaise de Vigenère," 4to., 1586, presented by Henry Willett, Esq.; "Marieberg's Historia," &c., 8vo., 1880; and "Rörstrand's Historia," &c., 8vo., 1879, both presented by the author, Herr G. H. Stråle; R. W. Cochran-Patrick, Esq., M.P., "Records of the Coinage of Scotland," two volumes, 4to., 1876; "Saggi istorici d'Antichità Toscane di L. Cantini," ten volumes, 8vo., 1796-1800, from Admiral De Kantzow. Among those purchased may be noted:—A very fine copy of Watteau's engraved works, two volumes folio, a book of which no desirable copy has previously occurred for sale in London for many years. "Musée Royal de la Haye," folio, Amsterdam, 1830; Bunbury, "Military Costume," 1791; "Military Costume of Europe," two volumes folio; Roller, "Les Catacombes de Rome," two volumes folio, 1881; "Black's History and Antiquities of the Company of Leathersellers," folio, 1871, with fac-simile of Charters, &c. A few additions have been made to the collection illustrating early printing and book ornament, among which may be mentioned—Brandt, "Von dem Anfang und Wesen der hailigen Statt Jerusalem," 1518; "Dance of Death," printed at Zurich, 1650; "Reynard the Fox," Hamburg, 1660, and another edition, Rostock, 1662. The collection of bookbindings has also had a few additions, among which may be mentioned a "Manuel des Oraisons," in a good French binding of the latter part of the sixteenth century; and a favourable example of modern French work in an edition of Boileau, bound for King Louis Philippe in purple morocco, richly tooled and ornamented with cyphers and *fleurs-de-lis*. Duplicates of important books have been secured when possible; among these may be mentioned an additional copy of "Chippendale's Gentleman's and Cabinet Maker's Director," folio, London, 1762. This book, which is no longer common, was purchased very cheaply in Lisbon, where the designs of Chippendale and other English art-workmen were much used in the last century; Clarac's

large work, "Musée de Sculpture," and Kretschmer's *Costume, "Die Trachten der Völker,"* 1864.

The number of original drawings added to the collection has been 586. Among these are 12 studies by Blake; 21 designs by Stothard; 178 designs for monuments and mural tablets by J. Bacon; some sketches of animals by Robert Hills, and others by Verboeckhoven; two highly-finished drawings in gold and colour, continuing the series supplied by Herr G. Fuchs, in illustration of the enamelled shrine of St. Alban at Cologne. The number of engravings acquired has been 1,820, including some additions to the valuable collection of ornament by the early German masters; a series of eighty-six engravings after works by R. Wilson, R.A.

The number of photographs added has been 1,845. Among these may be mentioned a series of 40 illustrating Russian art objects, presented by the Russian Government; a collection of 299 giving details of Italian architecture, sculpture, and painting; 179 of the drawings of old masters in the Royal Collection, Windsor; and 35 of the Grand Ducal Gallery of Paintings at Carlsruhe. Two thousand two hundred and sixty diagrams, drawings, prints, and photographs have been lent to Schools of Art institutions in the country or for use in the lecture theatre. The number of prints, drawings, and photographs either lent to art museums for circulation or exhibition or otherwise, in use out of the library, is upwards of 11,000.

Special classed lists of the books contained in the Art Library continue to be prepared, and are found serviceable to students and readers. That on painting was issued during the year; it is divided into twenty-two classes with sectional subdivisions, and gives the titles of 812 works bearing on the subject. A classed list of costume, prepared by Mr. Alfred Maskell, was also issued, including 1,170 titles.

### LEEDS CASTLE.

A PAPER was read by the Rev. Canon Scott Robertson at the meeting of the Kent Archæological Society descriptive of Leeds Castle, Kent, the seat of Mrs. Wykeham-Martin, the following being an extract from the paper:—

This remarkably-fortified dwelling is surrounded by the largest moat in England. Originally it occupied three distinct islands. On one stood the barbicans; on the second and largest island were the gatehouse and guardrooms, with a large bailey or courtyard, and beyond was the lord's dwelling; on the northernmost island stood the keep, which still remains. The barbicans, now in ruins, are seen as we approach the gatehouse, and the ruined water-mill is beside them. Much of their masonry is of the thirteenth and fourteenth centuries. The gatehouse contains remains of the Early English building dating from the reign of Henry III. or John; it was raised in height by Edward I., and the machicolations were probably added by Richard II. The lord's dwelling was rebuilt in the time of James I.; but the Jacobean house was pulled down in 1821, and the present dwelling was built in 1822 and following years, when stone arches were for the first time placed beneath the ancient bridge between it and the old keep. Previously there had been bridges of wood between the two buildings and the central stone pier, and portions of these wooden bridges had been originally movable, as drawbridges. When the Domesday survey was made in A.D. 1086, Odo, Bishop of Baieux, had here a park and two arpents of vineyard. From the mention of the vineyard as well as the park, we cannot well doubt that a castle stood here in Bishop Odo's time. After the bishop's disgrace, Leeds was granted to a knight named De Creve-cœur or De Crepits Corde, whose name would now be called Croker. Seven generations of this family possessed Leeds during about 175 years. One of them founded Leeds Priory in A.D. 1119, and some portions of the foundation of his castle here may still exist. A cellar, 60 feet long, which extends beneath the modern residence from its front door to the grand staircase, is said to be of the twelfth century. It has somewhat the appearance of being hollowed out of the solid without any vaulted masonry at all. The foundations of the old castle are also thought by Mr. G. T. Clark to be those of a shell keep, either Norman or Early English. We find the fortress mentioned by chroniclers during the reign of King Stephen as having been seized in 1138 by Robert, Duke of Gloucester, a partisan of the Empress Maude. From him, however, it was rescued by Stephen.

In the contest between the barons and King Henry III. the owner of Leeds Castle fought with the barons at Lewes against the king. Consequently his estates were forfeited, and on November 30, 1265, Leeds Castle was granted to that distinguished and loyal Kentish knight, Sir Roger de Leybourne, who occupied the castle after he obtained possession of this estate; and when he was Lord Warden of the Cinque Ports he regarded Leeds Castle as his principal place of residence. As he died in 1271, his tenure was very brief. So much litigation ensued with the Creve-cœurs, that Roger's son, Sir William de Leybourne, was glad to alienate Leeds to King Edward I. and Queen Eleanor. This he did between A.D. 1271 and 1279. Mr. Wykeham-Martin traces his

descent back through the Lords Say and Sele to Idonea de Say, daughter of Sir William de Leybourne, and it was very remarkable that the estate should return to descendants of the family which held it so many centuries since. During the next two hundred and seventy years Leeds Castle was a royal domain, and for about the first half of that period it formed part of the dowry of successive queens. The good Queen Eleanor of Castile was the first on whom it was settled. Her royal husband, Edward I., delighted in rendering this castle stronger and more perfect as a fortress. Several important State documents, dated from Leeds Castle, prove that Edward I. resided here on seven different occasions in five of the years which intervened between 1279 and 1289. When the beloved Queen Eleanor died, on November 28, 1290, the king caused the anniversary of her decease to be observed with great magnificence in the chapel of the castle here. So stately and splendid was this anniversary celebration, that upon it was expended no less than 25%, which would then be equivalent to about 375% of our money. The king likewise founded and endowed in the castle chapel a chantry of four canons and one clerk, who should pray daily for the repose of Queen Eleanor's soul. When Edward I. visited Leeds in August 1289 it would appear that he planned the construction of a swimming-bath, which still exists, and is used as a boat-house. This bath was commenced a few weeks before Queen Eleanor died, and it is probable that grief for her loss kept Edward from ever again visiting Leeds; so that we believe he never used the bath which he had planned. It was paved with large slabs of Reigate stone, and protected by two wooden sluice gates.

Queen Isabella, on a pilgrimage to Canterbury, came hither, desiring to pass the night at Leeds, and as the reversion of the castle, after the death of Queen Margaret, had been legally settled upon her in 1314, she had full right to demand entrance. The king, however, had actually given the fee simple of the castle to Lord Badlesmere; and, as possession is nine points of the law, Lady Badlesmere refused to admit the Queen, and resisted her efforts to force an entrance. A siege of the castle was the consequence, and Edward II. summoned all loyal knights of Kent, Surrey, Sussex, Hants, and Essex to muster at Leeds, from October 20 to October 23, 1321. The king himself arrived on the 26th, and the castle being captured by his forces, Edward remained there till November 4. The castle having been seized, its lord was not long at liberty. Lord Badlesmere was hanged in Blean, and, according to the barbarous custom of the period, his head was fixed over the Burgate of Canterbury. Several of his supporters were also executed. In the reign of Richard III. Leeds Castle was settled upon his queen, Anne of Bohemia.

King Richard resided here for a day or two about 1392, and for one or two weeks in July and August 1395. During the latter visit he received Froissart, the chronicler, here; and from Leeds the king dated those writs by which the Chancellor of Oxford was bidden to expel Lollards from the University, and to cause Wycliff's book ("Trialogus") to be examined. Later on, the same king was brought to Leeds as a prisoner, consigned hither by Henry IV. That successful usurper was here himself in April 1401; and he settled Leeds Castle upon his wife, Queen Joan of Navarre, in 1406. This king granted the use of the castle to Archbishop Arundel, who probably became constable of Leeds, as he did also of Queenborough Castle. Several documents are extant, which he dated in 1412 from "our castle of Ledes."

In 1425 Queen Katherine of Valois, widow of Henry V. and mother of Henry VI., was put in possession of Leeds Castle. She retained it until she died, which happened a few months after that of Queen Joan of Navarre, in 1437; but whether Queen Katherine, the wife of Owen Tudor (grandfather of Henry VII.), actually resided here we cannot ascertain. Before her death, however, many additions to the building had been made, and much was done in the way of repairs. Amongst these works may be mentioned the insertion of the curfew bell now hanging in the tower, which still rings the knell of parting day at eight o'clock every evening. It is dated "Pan 1435," and is adorned with representations in low relief of the Virgin and Child, of our Lord's Crucifixion, and of St. George and the Dragon. Henry VI. seems to have visited the Castle soon after the death of his mother; the exact date of his coming is not known, but it was about 1437 or 1438. Under Sir Henry Guldeford's management the existing "Old Castle" assumed the shape which it now has, and the Maiden's Tower was built. He commenced repairing the Castle as early as the year 1517, and he continued the work during six years at least. For the cost of these prolonged building operations he received large sums annually from the king's privy purse; sometimes 200*l.* and sometimes 300*l.* in a year. In 1520 Henry VIII. determined to visit the Castle when going to meet the Emperor and the French King. Then special efforts were made to push on the works here in preparation for the King's arrival. No less than 426*l.* was therefore drawn from the royal purse for repairs of Leeds Castle during the months of February, May, and June, 1520. Nor was all then finished; three years later we find the King paying 150*l.* more to Sir Henry Guldeford for the buildings at the Castle of Leeds. While the Court remained in France, on the occasion of the celebrated meeting between Henry VIII. and Francis I. at the Field of the Cloth of Gold, bucks were continually sent over from the park at

Leeds to supply venison for the tables of the vast assemblage encamped at Calais and Guisnes.

The Castle passed by purchase into the hands of Lord Colepeper about the year 1632. His only daughter, Catherine Colepeper, resided here with her mother, and married Thomas, the fifth Lord Fairfax. She died here in 1710, and the name of Colepeper ceased to have any connection with Leeds. The Fairfax descendants of her daughter the Colepeper heiress, however, remained in possession until A.D. 1800. General Philip Martin was the last owner of Leeds who had in his veins any blood of the Colepepers or of the Fairfaxes. No near relations survived him. He bequeathed his estate to his second cousin once removed, Fiennes Wykeham, son of Richard Wykeham, a descendant of the Lords Say and Sele, and of Sir Roger de Leybourne, who possessed Leeds Castle for a short period 500 years ago. General Martin left 30,000*l.* for the restoration of the Castle, and this fund was judiciously expended by Mr. Fiennes Wykeham, who took the addition name of Martin. He pulled down the Jacobean residence of the Smythes, and erected the present dwelling-house of noble proportions.

### THE NATIONAL ART COMPETITION.

THE report of the examiners in the Competition for National Medals in 1881 has just been published. It states that the number of drawings sent up from schools of art for examination was 197,048 from 157 schools of art. Of these works, 1,218 were referred to the National Competition, being 229 more than in 1880, when the number was 989. In these works a general improvement has called for the award of so large a number of the higher distinctions, that only those are exhibited in respect of which medals or Queen's prizes of books in the National Competition have been awarded.

The examiners for Figure Drawing and Painting were Messrs. G. D. Leslie, R.A., W. F. Yeames, R.A., E. J. Poynter, R.A., Director for Art, and H. A. Bowler, Assistant-Director for Art. They report that in the competition for the medals for drawing from the Antique and the Life a decided improvement was observed. The competition was more equal than in previous years, owing to the rule forbidding the use of backgrounds in chalk studies, which has left the students more free to observe the niceties of form in the contours of the figures selected. The Gold Medal for the Antique was awarded to a figure of Silenus nursing the infant Bacchus, from Edinburgh. To Edinburgh also was awarded the Gold Medal in painting from the Antique, in which a background is admitted, for a monochrome study of the same figure, excellent in its treatment of the head, but in which the modelling of the limbs might have been carried further, as is shown by comparison with the chalk study. The Gold Medal for the drawing from the Life was awarded, with some hesitation, to a drawing from South Kensington, to which the least objection could be made, and which was characterised by a graceful treatment of a thin and delicately-marked figure. A Gold Medal was well earned by a painting of a nude figure from Birmingham, which was quiet in colour, firm in drawing, and well-considered in tone and in relation to its white background, though its effect was injured by incompleteness in the parts a little removed from the figure. The Examiners recommend that in future a special Silver Medal shall be offered for a study, in light and shade only, treating a number of objects with especial reference to "tone," and the true expression of their relative force in light and shade and their position in the picture. The subjects of these studies may be objects of still life, casts of ornaments, or combinations of these. This will supplement the drawing from the Antique, now treated without background, by a form of study for which the Antique figure has been in some schools too exclusively used.

The examiners for Design with Architecture and Modelling—Messrs. J. E. Boehm, A.R.A., William Morris, J. J. Stevenson, and the Director and Assistant Director for Art—state that the Gold Medal for architectural design was awarded to a design for a cathedral, somewhat grandiose, showing also imagination and a sense of beauty, though not quite practicable for execution. A second Gold Medal was given to a set of drawings showing an admirable method of study. Well-selected examples of church porches had been visited, measured, and carefully drawn in preparation for designing a number of porches in the historic English styles. The drawings were well executed in pen and ink, and the filling in of the tracery openings with dead black, which gave an ugly and untrue effect to some other drawings, was avoided. In a design for a candelabrum for a synagogue, remarkable for careful study of classic forms and ingenious application to its purpose, though unsuitable from the introduction of figures, the conventional form of the branches for seven candles was gracefully treated and thoughtfully enriched. It gained a Gold Medal. In Modelling, the excellent teaching of the instructor at South Kensington secured almost all the prizes for that school.

In the section of Design the examiners were Messrs. H. S. Marks, R.A., W. Morris, J. J. Stevenson, and the Director and Assistant-Director for Art. They say that a Gold Medal was awarded for a carpet from Salisbury of good colour, carefully designed, and well expressed in the drawing, the various parts

being in good proportion, and the border especially well treated. A Bronze Medal was awarded to another carpet for good colour and design, though wanting in constructive knowledge; and a Book Prize for one treating the thistle cleverly as regards form, though failing in colour. Generally the works in this section suggest the observation that too much interest is shown in ingenious twisting of the plant forms used in the designs, and too little pleasure in colour, which should be the first consideration in a carpet. Wall decoration was represented by numerous carefully-executed works, especially from Nottingham, in one of which the Guelder rose was ingeniously conventionalised. The use of gold is too readily resorted to, and designs are too frequently put on a black ground; black and gold no doubt form a safe combination with which almost any colour may be made tolerable, and the difficulties of combining pure tints are thus evaded in many cases; moreover, the pattern would have had a better effect on a white or some other light ground, but many of those exhibited would have made the walls of an ordinary room oppressive. Lace designs were as usual beautifully executed. Gold Medals were given for designs showing a just distribution of textures of thick and thin work, and a genuinely artistic conventionalising of plant forms and flowers in design for pillow lace which came from Dover. The designs for Pottery were discouraging. Students seem to have studied the current show in shop windows rather than examples of work of the best periods. Little skill was shown in the proper conventionalising of plant forms. The designs were frequently merely direct copies of bunches of flowers, not even well placed on the surface to be decorated. Ribbons also seem to have been designed without thought, mere vulgar copies of flowers, and those not well done. One sheet received a small award for evidence of a somewhat better treatment. Designs for white damasks exhibited want of appreciation of the opportunities this fabric offers for beauty to be obtained by the interchange of shades of white, which when skilfully employed should depend rather on agreeable distribution of quantities than on arrangements based upon flow of line. The exercises in Design, which were too much confined to simply covering a given space with mere repetition of accidental forms, would have been better if based on selected geometrical lines, to which floral forms derived from nature should be applied. The analysis of plant forms, valuable as a study, is still too much used for supplying in the place of design mere mechanical arrangements.

The examiners for Painting in Oil and Water-colours were Messrs. H. S. Marks, R.A., L. Alma-Tadema, R.A., Val Prinsep, A.R.A., and the Director and Assistant Director for Art. The works representing still-life in oil and water-colour excited the admiration of the examiners, which was expressed by a large number of awards. The Gold Medal for oil painting was gained for the Liverpool South District School of Art by a firmly-executed imitative painting in a large style, in which the objects represented kept their places in their various planes remarkably well, owing to the truth of tone in the work. The effect of many of the oil studies is lost by the too great use of mediums. The most successful water-colour work was distinguished by similar qualities, and was a pure, broad, carefully-finished, and effective drawing painted in washes, with close attention to truth of tone and light.

The useful study of drapery should be more general.

### THE GHENT EXHIBITION OF INDUSTRIAL ART.

THE first exhibition of industrial art organised by the *Chambre Syndicale Provinciale des Arts Industriels* was opened in Ghent on August 12, 1877. The exhibition comprised two sections—the modern and the antique—representative of modern house-furniture, carved oak work, inlaid work, &c.; also textile fabrics of every description, specimens of Belgian lace, ceramic ware, crystal, and jewellery, along with highly-finished iron and metal work in mediæval style, tapestry, ivories, glasswork, &c. The *Chambre Syndicale* was founded at Ghent in 1866 for the purpose of "stimulating the genius of artistic creation in relation to industrial applications, contributing to popularise the study and sentiment of the beautiful in the production of industrial objects," and its first exhibition exerted a distinct influence on the manufactures of the country; but it was noticed that the art of industrial drawing had not kept pace with the demands of manufacture. As it was impossible to organise an exhibition every year, the *Chambre Syndicale*, with the special object of improving the art of industrial drawing, and of improving the position of the draughtsman, instituted an annual competition in designs, to which was added an exhibition of illustrated works bearing upon the subject. At the first of these competitions, which was held in 1879, there were ninety-nine entries for the nine competitions, seven first and seven second prizes being awarded. In the following year there were over a hundred competitors in the twelve competitions, the first prizes being withheld in only a few instances. Last year the number of competitions was increased to twenty, and included designs for a ceiling, an entrance door, a cast-iron pump, a wrought-iron balcony, a staircase, &c., the first prizes being withheld in five cases, while the number of entries are gradually increased. For the present year the

Chambre Syndicale announce an exhibition of industrial art, to open in the halls of the Ghent Casino on August 28, and to continue until October 18 following. Like the former, it will comprise two sections:—1. Modern, including (a) a general exhibition of objects of industrial art manufactured in the country; (b) competitions in designs for such objects; and (c) competitions in manufactured objects. 2. A section of objects anterior to the nineteenth century, relating to industrial art, Belgian or foreign. Besides the prizes in the competition, medals of silver-gilt, silver, and gold, as well as honourable mentions, will be accorded to such exhibits as evince the greatest merit in design, taste, and execution, or which illustrate a new industry; while medals will also be granted to the designers of successful exhibits. It is expressly desired that the selling price be affixed to the exhibits. Works intended for competition, which must be strictly original, are to be deposited anonymously before August 12, a clause which, it is announced, will be rigorously observed. The competitors are not restricted to Belgians, but are extended to those who have lived three years consecutively in that country. The committee reserve the right to purchase the works entered at the prices stipulated in the programme.

The following is the classification decided upon for the modern section of the forthcoming exhibition:—

*Building.*—Ornament in stone, carton-pierre, plaster of Paris, artificial stone, &c.; natural and artificial marbles, pavement, &c.; joinery, including doors and floors.

*Furniture and Decoration.*—Decorative painting on stone, wood, cloth, graining and marbling; cabinet making, including furniture in which wood predominates; furniture with the application of marquetry and inlaid metal work, including carriages and sledges, pianos, and articles of furniture connected with telegraphy and telephony, wood frames, gilded or not, for mirrors, pictures, &c.; earthenware and porcelain, moulded and cut glass; stained and engraved glass, mirrors, wall paper and imitation leather.

*Metal Industry.*—Goldsmith's work, jewellery, watchmaking, engraving on cameos, &c.; enamelling, nickelising, chasing, &c.; ecclesiastical art, artistic bronzes, wrought and cast iron, clocks, appliances for lighting and heating, stoves, fenders, &c., electro-metallurgy, arms and cutlery, wrought and cast iron-work, including balconies, articles in brass and zinc, the panels of doors, gates and locks, door-handles, bells, knockers, &c.

*Textile Industry.*—Various wove fabrics, shawls, &c.; book-binding, tickets, &c.; printing, engraving on stone, on wood, on zinc, and on copper, chromo-lithography; photography in its application to industrial art, to the exclusion of portraits and landscapes (the proofs must be permanent, i.e. obtained by the carbon process, heliography, photo-lithography, &c.); models for the teaching of drawing, reproduction of objects of ancient art in plaster and wood, or by electro-metallurgy; materials for the arts of painting and drawing; designs and models of industrial art, &c.

The competitions of the first series include designs for a mantelpiece, a funeral monument, a candelabrum for gas, a book-case, a cabinet, a staircase window, a pulpit, an ecclesiastical gaselier, a carpet in seven colours, and an epergne; and of the second series (executed works), the furniture and decoration of an office, a staircase *jardinière*, a telescopic table, four chairs, a porcelain dinner service, a table-cloth and dozen napkins, an ecclesiastical lamp, artistic and economical bookbinding, and a *courouse* carriage.

The Président d'Honneur is M. Léon Verhaeghe de Naeyer, Governor of East Flanders; the president, M. Constant Verhaeghe de Naeyer; and the secretary, M. Emile Varenbergh, Ghent.

### PRIORY OF ST. PANCRAS, LEWES.

EXCAVATIONS of a highly interesting character are, the *Sussex Advertiser* says, now on the point of being undertaken in the grounds of the ancient Priory of St. Pancras at Lewes, under the direction of Mr. Somers Clarke, jun., F.S.A., and under the local supervision of Mr. W. H. St. John Hope, of Cambridge, whose name is well known to antiquarians. The researches promise to be of national interest. The Priory of St. Pancras, founded by William de Warrenne and Gundrada, is one of the most ancient specimens of Norman architecture in this kingdom. Considerable historical interest attaches to the building, partly on the ground that it is one of the very few houses of the Cluniacal order once established in this county. The Cluniacs were noted for the splendour of their appointments, the magnificence of their churches, and the openness of their hospitality. The great Monastery of Clugny, in Burgundy, possessed a church which was exceeded in size by few, if any, in Europe. Its plan presented the unusual feature (in France) of eastern and central transepts; a plan we find in England at Canterbury, Lincoln, Beverley, and several other places. It is evident that the great church at Lewes was planned in the same way. The foundations of the eastern portion of the great church, and also part of the chapter-house, were laid bare in the year 1847, at the time of the construction of the Brighton and Hastings Railway. The bones of the noble founders were also discovered. Since then nothing has been done. It is,

however, sufficiently evident from an examination of the remains, and a comparison with others of a somewhat similar nature, that beneath the surface must lie a large portion of the nave and choir of the church, together with the bases of the western towers; also the substructures of the dormitory, refectory, infirmary, and other important adjuncts connected with a monastery of the first importance. A rough description by Portenari, who superintended the demolition of the church in 1537, gives a list of the number of pillars and the dimensions of certain parts of the building. It is now intended to open up the rest of the ruins.

### ROMAN CAMP AT BIRDOSWALD.

A VISIT was paid by the members of the Royal Archæological Institute to the Roman Camp at Birdoswald. While inspecting the ruins of the eastern double gateway Dr. Bruce made the following remarks on the Roman wall. He said it was known that Agricola came in the year 80; and before he advanced into Caledonia he left several bands of troops located in strong posts from which they were never driven. He fancied that this at Birdoswald was one of Agricola's camps. The position was a remarkably strong one. It was well defended. In the year 120 Hadrian came to the camp, finding the country in great disorder and requiring his personal attention; he built a wall, and he seemed to have made use of such of Agricola's stationary camps as suited his purpose in laying the line of his wall. This wall consisted of two parts. One was a stone wall 8 feet thick, and how high they could not tell—probably about 16 or 17 feet. On the north side of this wall there was a ditch or fosse, and frequently material was taken up to form an additional rampart. As they went along they would see the fosse frequently. On the south side of the stone wall, from Newcastle to within a short distance of the termination of the western end at Drumburgh, there was an additional fortification—three earthen ramparts parallel to one another, with a fosse between the first and second of them, nowadays called a vallum, or earth or fosse wall. Between the two walls there ran the road by which supplies were carried, and portions of the road were quite distinct and perfect to the present day. To the east of them they had it for ten miles together. Another feature of the wall was the accommodation made for the garrison. In all probability it took 15,000 troops to garrison the wall. At the average distance of four miles there was a station, such as this on which they were standing. The station or mile castle consisted of a series of buildings about 60 feet square. Between these mile castles there were three or four turrets about 10 feet square, the walls of which were about 3 feet thick. He called them stone sentry boxes. One feature of these stations was the gateways. They had here a remarkably good specimen of the gateway, and they were all built on the same principle. The gateway was a double one, usually about 11 feet wide. These gateways were arched over. On each side of the gateway was a guard chamber. He pointed out the sites of the guard chambers, which had been filled up, and, continuing, said that opposite the arch in front there was an inner arch, and the gateways were in a double sense double. They frequently saw marks of the pivot holes of the gate. There were pivot holes at the bottom and at the upper part, so that in order to put a gate in its place they had to lift it up through the upper hole and let the gate down into the bottom one. This station was the largest on the wall, and consisted of five acres and a quarter. The one next in size was at Chesters, on the North Tyne. Both of these camps had the peculiarity of having two gates on the eastern and western sides. Usually in every other instance the Romans had four gateways, at north, south, east, and west, and roads going from one to the other about 18 feet thick. Minor streets in the camp were very narrow, scarcely enough to let two to pass, the object being to show as little face to the enemy as possible. The gateway immediately opposite to them had tumbled in, the ground having given way, and the other was a single one. The wall went right away from the east. They saw a series of serrated hills over there. These were called the "Nine Nicks of Thirlwall," the wall having been *thirled* or pierced there first of all. For ten miles the wall went through a basaltic dyke, and this dyke was steep towards the north, and the wall was on the top of that again, giving a strong defence against the Caledonians. It came along and crossed the Irthing, and then came up a steep ascent. Always in the vicinity of a Roman camp they had suburban buildings. In addition to the troops they had camp followers, and they occupied generally the sunny side of the slope. At this eastern side they had extensive remains of suburban buildings. Generally the prefect or commander of the cohort had a villa outside the walls. In times of peace and quietness he did not like to be cramped up in the camp, and he had his villa outside. He did not think they had any trace of it here.

The vallum and the wall did not run parallel. The wall caught rising eminences, and the vallum ran more in straight lines, and usually by the tail of a hill. Sometimes the wall and vallum were a quarter of a mile apart, and sometimes as close together as possible. The question bore on who built the wall. The vallum going along the tail of a hill, leaving great elevations to the north of it,

would give a great advantage to the Caledonians; and that was one reason why they fancied the two works were the work of one engineer. Some of the better buildings of the camp were warmed by a hypocaust. In all the Roman camps they had hanging floors; and they had a furnace at one extremity which warmed the air, and this heated air was carried underneath the floors and up the sides of the house, so that a small quantity of heat produced great effects. The floors were perhaps 9 feet thick, and the system of heating had one advantage. If the furnace were ever so hot it did not immediately affect the temperature of the room; or if the fires went out it was a long time before the cold was experienced. The heat would be kept constantly uniform, and would be greatly economised. There was no doubt that the Romans used coal. They found coal and coal ashes in their stations. The Romans were particularly careful to be in the vicinity of good water. He did not think they were fond of having a well in the stations. There was a well in the camp at Maryport, but they usually had the water outside. In this instance there was a well in the middle. The last time the Institute was at the camp they found there was a tank there. The water was brought from a considerable distance by means of a conduit under ground, and arrangements were made for filtering the water. Remains of charcoal were found, and it was believed that the water before being used passed through sides made up of gravel and of charcoal.

The Romans built the wall on the north of rivers. The object of this was to secure the fertile land of the valleys, and further, when driven from the wall, to have an additional barrier in the river. As to the shape of the stones the Romans no doubt made the ancient Britons work at the wall, and the stones were usually 8 or 10 inches square in the front, and almost always cut across the line of stratification, so as to stand the weather. He had seen them 2 feet long, so as to get a good grip of the wall, and they were always wedge-shaped, tapering smaller at the inner end than at the outer. The mortar was harder than the stones. There were no tiles used in the wall.

Passing to the southern gateway, Dr. Bruce pointed to the remains of a circular vault next to the western guard chamber, which he thought must have been used for drying wheat. In this country the corn did not ripen quickly, and they required to dry it. He drew their attention to the corners of the camp, and said they were always rounded. The reason of this was that the Romans, when they came to build the wall, first of all made themselves secure within good stone ramparts, and they built a camp independently of the wall, and adopted the plan of rounded corners. The remains of the north gateway were in the road. Before leaving the south gate he read a passage from the late Earl of Carlisle's "Diary in Turkish Waters," in which, speaking of a view at the supposed site of Troy, he said the best notion he could give of it to a Cumberland borderer was by telling him that it resembled the view just outside the camp at Birdswald.

## THE SCIENCE AND ART DEPARTMENT.

THE twenty-ninth report of the Science and Art Department of the Committee of Council on Education, just issued, states that the number of persons who have during the year 1881 attended the schools and classes of Science and Art in connection with the Department are as follows, viz.:—61,177 attending science schools and classes in 1881, as against 60,871 in 1880; and 917,101 receiving instructions in art, showing an increase upon the previous year of 79,793. The attendance at the Art and Educational Libraries at South Kensington and the National Library of Ireland in 1881 has been 84,949, or an increase of 765 over that of last year. The museums and collections under the superintendence of the Department in London, Dublin, and Edinburgh were last year visited by 2,464,538 persons, showing an increase of 132,095 on the number in 1880. The number of visitors to the South Kensington Museum has increased from 981,963 in 1880, to 1,017,024 in 1881. The returns received of the number of visitors at the Local Art and Industrial Exhibitions, to which objects were contributed from the South Kensington Museum, show an attendance of 1,361,900 persons, as against 696,541 in 1880, or an increase of more than 95 per cent. The total number of persons who during the year 1881 attended the different institutions and exhibitions in connection with the Department has been 4,811,258. This total, compared with that of the previous year, presents an increase of 876,103.

New schools of art have been established during 1881 at Bedford, Bournemouth, Burton-on-Trent, Chiswick, Hertford, Ilkley, South Shields, St. Albans, Waterford. The total number of schools of art in operation throughout the kingdom was 160, with 11 branch classes. The total number of students in these schools and their branch classes was 31,592. At the annual examination in April 1881, 19,940 students submitted 197,048 drawings or models; the corresponding numbers in 1880 having been 19,338 students, and 170,383 works, so that the annual increase reported in previous years is still maintained. In this examination 17,361 students, on account of whose instruction payments were made to the committees of the schools, were of the industrial

classes. The examinations in second grade drawing were attended by 11,994 students of schools of art, of whom 4,521 were successful, and 1,180 obtained prizes. The corresponding totals in 1880 were 10,949, 6,022, and 1,934 respectively.

The number of students in art classes was 23,026 in 584 classes, the corresponding numbers in 1880 having been 26,646 in 632 classes, and in 1879, 29,323 students in 732 classes. This decrease in 1880 and 1881 as compared with 1879 is attributable to the extended operation of the rule requiring a higher certificate to be held by teachers of art classes. The number of students in these classes who attended the examination in drawing of the second grade was 11,322, of whom 2,905 passed the examination, and 600 obtained second grade prizes; while 428 obtained prizes for works sent up for inspection. The total number of works sent up from art classes for examination in April was 168,720 by 13,187 students.

## PROTECTION AGAINST FIRE IN THEATRES.

IN a paper read before the members of the American Franklin Institute, Mr. C. J. Hexamer stated that a list of fires in theatres, compiled by himself and necessarily incomplete, showed that 150 theatres had burnt down in the last 100 years. This study of the subject had led him to conclude that destruction by fire is the natural end of theatres. Various devices have been used to render the decorations more incombustible. The flies have been made of wire gauze and the interstices filled with an incombustible material, giving entire security against fire, but rendering the flies inconvenient to handle, on account of the weight. Water glass, which has been used as a fireproof paint for scenery, has been found to change its chemical composition after a time, and to then give no further security. The same deterioration is found to exist with several other substances which have been tried, and it would seem from experience in the Paris theatres that combustibility of scenery was even ultimately increased in some cases by the application of protective substances. When water glass is used the water colours employed in scene-painting may have dissolved the greater part of the silicate at the start. To obviate this some incombustible substance might be precipitated into the fibres of the canvas. For instance, after thoroughly soaking the canvas in water glass it should be placed in a dilute solution of hydrochloric acid; which would precipitate the silica inside of the fibres of the yarn itself. The silica, being insoluble in water, could not be washed out, and on account of its precipitation in the fibres could not readily be thrown out. The combustibility of scenery is also lessened by painting it on both sides, thus destroying the fuzz on the back of the scenery along which the flames spread; simply whitewashing the back of the scenery would be useful for the same reason.

But before the scenery is attended to it is necessary that the building itself should be of proper construction. The rear and two sides of the stage (including green and dressing-rooms) should be enclosed by thick brick walls. The roof and roof-trussing should be made as nearly as possible fireproof, as the rigging loft is generally attached to the roof-trussing. To divide the stage from the auditorium a wire drop curtain becomes necessary, which should be kept in perfect order and be automatic. "It should be let down after every performance, and should not be raised until fifteen minutes before the beginning of the performances." This would insure its being in good order. Proscenium boxes should be of brick or iron, as some of the stage settings are very near them, and in case of fire these boxes might be ignited in the time required by the curtain to lower itself. The wall dividing the stage from the auditorium (proscenium wall) should be of brick; starting from the foundation, it should be broken by the stage opening and orchestra doors only. Above the stage opening an arch should be sprung, and the wall carried up on this at least 18 inches above the roof. The joists and flooring boards of the stage should not extend beyond one foot of the proscenium wall, as they would transmit flames to the woodwork of the orchestra. In the same manner, the joists of the parquet should extend merely to this wall, and by no means through it. The doors contained in this wall should be lined with iron, as solid iron doors in great heat soon become warped and useless, while iron-lined doors in the greatest heat retain their shape. All doors in fire-walls should have springs or weights attached to them, so as to be at all times closed. They can be closed automatically by a weight, which is released by the melting of a piece of very fusible solder employed. One of the chief dangers of theatres is in the numerous gas flames, in dressing-rooms as well as on the stage, and all gas brackets should be protected by wire baskets, and swinging brackets be abandoned. Foot and border lights should be protected by wire screens and lighted by electricity, and care should be taken to keep the flies at a proper distance from the lights.

**Cardiff.**—The memorial stones of a Methodist chapel at Cogan Pill have been laid. Mr. Peter Price, of Cardiff, is the architect, and Mr. Marshall, Grangetown, the builder. The building is designed in the Gothic style, built of local stone. There will be sitting accommodation in the new building for 500 persons. Underneath will be vestries, where about 300 children can be taught.

## NOTES AND COMMENTS.

THE Glasgow Institute of Architects, in deference to the wishes of many of the architects engaged in the late competition for the proposed new Municipal Buildings at Glasgow, as also in accordance with the wish of the general public, have undertaken the management of an exhibition of the preliminary sketch designs submitted in the earlier stage of the competition. Rooms in the Corporation Galleries have been put at the disposal of the committee by the Town Council for the purposes of the exhibition, which it is intended shall be open from September 2 to September 14. It is desirable that all the competitors should endeavour to meet the wishes of the committee by sending up their sketch designs, so that the exhibition may be thoroughly representative of the work which has been done in connection with this important competition.

THE magnificent collection of bronzes, ivories, &c., of the Renaissance period lately purchased for the Louvre Museum, Paris, from Madame TIMBAL has just been arranged in the Salles de la Colonnade. The museum has also received a series of sketches by PAGNEST, the portrait-painter, and a fine bas-relief in stone by SARRAZIN, presented by M. FONQUIAU from the courtyard of his private house, the old Hôtel Effiat, in the Rue Vieille-du-Temple.

A SUM of nearly 11,000*l.* has now been subscribed for the establishment of the proposed art gallery and museum in Aberdeen. At a meeting of the general committee appointed by the subscribers, held in Aberdeen on Friday last week, the sub-committee proposed that out of this sum 5,000*l.* should be devoted to the erection of a building to accommodate the gallery and museum. This, it was urged, was quite a sufficient sum to expend on the building, the last ten or fifteen years having shown that art galleries need not be expensive buildings; and if a balance of 2,000*l.* or 3,000*l.* could be retained for future administration, a revenue of 120*l.* per annum would be obtainable.

As to the site of the art gallery some divergence of opinion appears to exist. At a meeting of gentlemen interested in the project, held the previous day, a site in Castle Street was advocated, it being thought that, in the event of the suggestion being agreed to, a number of improvements would be made in the property in the neighbourhood, and that thereby the rates of the city would be materially benefited. It was in consequence resolved to request the general committee to defer deciding on a site till more definite information could be obtained. The latter body, however, approved of the recommendation of their sub-committee, advising the grounds of Gordon's College to be taken in preference to the Castle Street site, the cost of the land per square yard being 10*l.* per annum in the former locality, as against 2*s.* 3*d.* in the latter. This was eventually decided on, though one gentleman expressed his opinion that it was tantamount to putting a wet blanket on the whole scheme, and protested that the question should not be settled offhand for the whole 100,000 inhabitants of Aberdeen, and without giving the public an opportunity of expressing their opinion.

THE passing of the Ancient Monuments Bill will be received with satisfaction by the archæological world and the public at large—with satisfaction, as it will, it is to be hoped, prove an efficacious power to safeguard whatever of interest we still possess of ancient days from wanton destruction and from mischievous mutilation. There will be no danger of the rights of property and private ownership being affected, as opponents of the measure were wont to insist, and in many cases landlords will be glad to have the benefit of that supervision which they are unable, or do not care, to exercise themselves.

THE solution of the Paris gas question, alluded to last week, has been put off for the present. M. FLOQUET, Prefect of the Seine, seeing that his project of an arrangement with the company had no chance of passing the Municipal Council—which, on the contrary, showed itself eager to begin a struggle, with the object of putting down the pretensions of the monopolist body—at a late meeting of the Council asked and received permission to withdraw his Bill; at the same time undertaking carefully to study the question during the recess, with the view of finding a means of compromise.

THE Scottish Arboricultural Society made an excursion last week, by permission of the Duke of ARGYLL, to the Rose-neath woods. Among other matters of arboricultural interest the yew tree avenue, a favourite walk of the late Dean STANLEY in his visits to Roseneath, was inspected. It consists of some forty aged yew trees, backed by two noble rows of limes and Spanish chestnuts respectively, while at its entrance stands a fine sycamore 120 feet in height, the bole of which, over 18 feet, measures more than 13 feet in girth at a height of 5 feet from the ground. The two silver firs named after our first parents "Adam" and "Eve," and said to be the finest in the kingdom, were also inspected. These trees are nearly 200 years old, and are mentioned by STRUTT in "*Silva Scottica*," the cubic contents of both being not less than 2,500 feet. The tree known as Eve, when measured in 1817 at five feet from the base, had a girth of 15 feet 9 inches, 19 feet 8 inches at one foot from the ground, and 17 feet 7 inches at three feet. In 1833 the measures of the girth were respectively 17 feet 7 inches, 22 feet, and 18 feet 4 inches; in 1881, 21 feet 8 inches, 28 feet, and 22 feet 8 inches. The measures just taken by the party on occasion of their visit gave 21 feet 8 inches at five feet from the ground, 28 feet at one foot, and 22 feet 8 inches at three feet, the altitude being 124 feet. The second fir, named Adam, is mentioned by STRUTT as measuring in 1822, 22 feet 4 inches at one foot from the base, and 17 feet 5 inches at five feet. In 1833 the measurements were, at the root 24 feet 9 inches, and at five feet, 18 feet 2 inches, while the height is given as 115 feet, Eve being 10 feet less. The girths of Adam are now 28 feet 10 inches at one foot, at three feet, 23 feet 4 inches, and at five feet, 22 feet, the height being about 130 feet.

SEVERE punishment has just fallen upon the members of the Executive Committee that has organised the carpenters' strike in Paris. This body has denounced or proclaimed the workshops of Messrs. PATRICE, and brought pressure upon the hands therein employed to come out. Under Article 416 of the Penal Code, which a month ago the Senate refused to repeal, although its abrogation had been voted by the Chamber of Deputies, the eleven members of the Committee have been condemned to fifteen days' imprisonment, to each pay a fine of 24*l.* as damages to the firm, and to insert the judgment in three different papers designated by the complainants. The importance of this decision is manifest, as it brings all picketing under the ban of the law, and renders it practically impossible for the future.

THE Corporation of Southampton have lately been in communication with the Keeper of the Public Records, having written to ask the Commissioners to have an examination made of the various ancient muniments of the Corporation with a view of ascertaining whether the muniments were of sufficient public interest and importance to justify them in publishing an abstract in the reports of the Historical Commission or of classifying them for general reference. In response the Commissioners say that they would gladly undertake an examination, having every confidence that much would be gathered from the Corporation's records of interest to historians and antiquaries. They are not, however, in a position to enter upon the work at once, as they have on hand many examinations of a like character which will fully occupy them to the end of the present year. The matter will, however, be borne in mind when the Commissioners meet to decide on the examinations for next year, and thus it is probable no great delay will take place before the wishes of the Corporation are carried into effect.

Two municipal schools of technical design, the first of the kind that have been established under official auspices in Paris, are to be opened towards the beginning of next October. These establishments, which are registered as communal schools, will be devoted to affording superior instruction in drawing and modelling to apprentices and workmen who have mastered the general principles of design, &c., at the ordinary day schools, and are desirous of learning how to apply them usefully in their several industries. This is but the first in a series of measures that the municipal authorities have expressed their intention of undertaking with the purpose of furthering technical education.

Church of S. Mary B.V. Balham.

Proposed additions.

Arthur Cawston, Architect.

## ILLUSTRATIONS.

AGRICULTURE, DECORATIVE FRIEZE: CARPENTRY.

NEW CHANCEL TO THE CHURCH OF ST. MARY, B.V., BALHAM.

THE illustration shows the additions which are in progress in the Church of St. Mary, Balham, from the designs of Mr. ARTHUR CAWSTON, architect, of 11 Clement's Lane, E.C. The walling has just been completed, and it is hoped that the mural decorations and choir stalls will be speedily undertaken. The seven small windows are to be filled with stained glass by Messrs. CLAYTON & BELL, at the cost of a benefactor to the church. Another gift is the pulpit, which has been carved by Mr. FRAMPTON from designs by the architect. It has been the endeavour to have all the details of the additions in accordance with the style of the original structure, and to preserve an ecclesiastical character without having recourse to Romanesque or Venetian Gothic for inspiration, as is sometimes done.

At present, naturally, the walls look very bare and uninteresting, but the good proportion shows itself, and when completed we consider that it will show the proper classical treatment of a classic church, instead of the popular mixture of Romanesque and Italian-Gothic with a pure Greek example.

The works have been carried out by Messrs. BOWYER BROS., of Upper Norwood, from the designs of Mr. CAWSTON, who was chosen architect from among some dozen competitors about two years ago.

## THE ROYAL ARCHÆOLOGICAL INSTITUTE.

IN course of the excursions, Lanercost Priory was visited by the members of the Institute, and Mr. C. J. Ferguson, architect, of Carlisle, gave a short sketch of its history on the occasion. In the course of his remarks he called attention to the two figures in the upper part of the gable, stating that it was a question whether, standing as they did, they had been properly placed. The buildings consisted of a cruciform church with conventual buildings on the south side. The plan almost sufficed to tell its history. It was a priory of Austin canons similar to that of St. Mary at Carlisle. The church must have been at first a smaller building and without any aisle. Subsequently aisles were added and extensions made, except on the south side, there being on the south side the conventual buildings. The south part of the church was the earliest and of the Transitional period. It seemed that the intention of the builders was at first to erect extensive buildings, and that was carried out by degrees. They found the choir and eastern portion of the church and the south and west sides of the cloister were built later, and the church was gradually built westwards, increasing in richness and culminating in the beautiful front they had now. The earliest portion, the transitional work to which he had referred, was built of different stone from that of the cathedral at Carlisle, and here the Roman stones were palpably to be seen.

Mr. Micklethwaite said the key to the form of a church was almost always more easily got inside than outside. When they had once mastered how a church grew they could almost at once walk to the place where the earliest work was. This was a church of regular canons, like that at Carlisle, but it differed in one respect, which was characteristic of the order. Here they had a church with only one aisle. The explanation of this was that the regular canons always founded their churches where parish churches already existed. If they had not done that this church would not have been at present in existence as it was. When the canons built it, it was built on the parish church lines, though much larger than the parish church. The twelfth-century parish church was built in different forms. He would only speak of one of these forms. There was a church in the form of a cross, but without aisles. The canons built on the same model, or at least began to build so. They had a church without aisles and a transept without aisles; and when they had built that much, they would build a cloister and the buildings round it to live in. The next thing they built was the nave. By the time they got to rebuilding the nave—it was about one hundred years or more after the foundation—the ideas of aisles had grown; by the end of the twelfth century or the beginning of the thirteenth the larger parish churches began to have aisles, and the canons thought they must have aisles too, and they accordingly made such additions. The canons had certain rights here, notably the right of procession, and there were doors for the procession to go through; and they found a door from the cloister as they found it in every abbey church. A door built up opposite the present organ would bring the canons into the church; that did not serve their turn, and therefore they had another door, traces of which they would see, not far from the other, not going into the church, but into the canons' part. Proceeding to the chancel, now without the roof, Mr. Micklethwaite

said he would only call their attention to the way in which, having freed themselves from the difficulty in the position of the cloister, the canons went in for double aisles and symmetrical arrangement. He could not give a reason for the pillars being longer on one side than another. As they came into the chancel they came through a doorway rather Early English than transitional. There, he believed, was one of the doorways between the parish church and the collegiate church. On the other side they saw the door by which the canons came in. He pointed to a transitional door, which he thought probably entered a little sacristy, and close to it there was a patch in the wall which he thought was the way up to the old dormitory.

Mr. Tucker, after describing the coats of arms on the tombs, said that the tomb of Sir Thomas Dacre on the south was interesting, because, like Lord Crawford's the other day, it was violated. This was about 100 years ago, and the body was never recovered.

## Naworth Castle.

This castle was the next place visited, where also Mr. Ferguson made some observations. The new portion of the castle, which is not yet finished, was inspected with interest. It has been described as a new wing at the north side of the castle, carried out in red and white stone. It comprises four storeys above the basement. At the east end is the Stanley Tower, each floor of which contains spacious well-lighted rooms, and at the west end is the Watch Tower. Between the two towers are bedrooms and domestic offices. On the basement is constructed one of Hayden & Co.'s apparatus for heating the entire castle with hot water. The floors are fireproof. The wing has a double connection with the main building, one of which has been cut through the solid walls of the original building.

## Hexham Abbey.

The Abbey church was here visited, the party assembling in the Cloister Garth. Mr. C. C. Hodges described the features of the building:—He said the site on which they stood was one of great antiquity, and could be traced back with tolerable certainty to the time of Hadrian. He would not, however, dwell on the Roman period, but come down to the time of St. Wilfrid of Ripon, who built a Saxon Cathedral here about the year 674, the only trace of which now remaining was an ancient crypt, the church having been laid in ruins by the Danes in 875. About the beginning of the twelfth century, when a great many churches were built in the north of England, a church was built here by the Canons Austin of St. Augustine. The place had been an exceeding fine one, as was evidenced by the remains. The Abbey was in its palmy days in 1296, when the nave was destroyed by the Scots. It was on record that on April 8 of that year the men of Galloway came into Tynedale under the command of William Wallace, burning and destroying every church and monastery and gutting the town of Hexham, where they cruelly roasted to death 200 boys who were in school by locking the door and setting fire to the building. In 1311 Robert Bruce came here several times, and in 1346 King David of Scotland came to Hexham on his way to the battle of Neville's Cross. After visiting the site of the ancient nave, of which a few remains were exposed, the party perambulated the exterior of the church, and afterwards entered by the south door. In going round the interior, commenting on the restoration, Mr. Hodges remarked that he looked upon restoration as mischievous stupidity or downright wickedness. They might be thankful that the outside of the building at least was comparatively untouched, and that Canon Barker, the incumbent, was thoroughly conservative, and would not let a stone be unnecessarily displaced. The attention of the visitors was drawn, among other antiquities, to a large Roman slab, found in looking for a crypt supposed to exist under a portion of the church. The carving depicted a Roman standard-bearer on one of the small horses of the day, brandishing aloft his ensign and trampling under foot a Pict. The inscription was quite perfect, and indicated that the monument was to the memory of a Roman soldier who had served with the Roman legions for twenty-seven years. Two Roman altars were also inspected, and many of the party evinced great interest in the effigies of departed knights that were placed about in great profusion.

Before leaving the church, Mr. Peacock said he thought the party ought to express their indignation and disgust at the ignorance and ruffianism of the architect who had carried out the work of restoration. They had never seen anything half so revolting as what they had seen to-day, and he thought that, considering the amount of destruction wrought, they should not go away without expressing their strong feeling.

Mr. Tucker (Somerset Herald) made some remarks on the heraldic paintings that adorn the front of the woodwork of the vestry, and Baron de Cosson, pointing to an old and battered helmet suspended on a crook from the wall of the chapel, said it clearly dated from the end of the fifteenth century—probably 1480. He pointed out that it had no very remarkable features except a "reinforcing piece" over the forehead.—Mr. Hodges said the helmet was that of Sir John de Fenwick, who was killed at the battle of Marston Moor in 1644. His skull was preserved, and in it was an aperture which corresponded exactly with the hole in

the helmet.—Baron de Cosson said the helmets were often worn long after they were made, and this one clearly dated from 1460 to 1480.

#### Town Hall and Moot Hall.

Luncheon was taken at the modern town-hall, after which the party visited the old Moot Hall, now partly used as an ironmongery store. A number of the members ascended to the top of the tower and enjoyed a magnificent view, one of the chief points of interest in the landscape being the site of a British camp on Warden Hill. Mr. Hodges said the Moot Hall had been built about the year 1400, but by whom or for what purpose there were no records to show.

Excursions were also made to Abbotsford and Melrose and Dryburgh Abbeys.

#### Melrose Abbey.

Here a paper was read by Mr. Kerr descriptive of the history and architecture of the buildings. He said that the name indicated the original appearance of the locality, being composed of two Gaelic words, Mull and Rhoss, or Ross, signifying a bare promontory. The name was formerly spelled Mulross, now Melrose. The site was formed by the winding of the River Tweed through a narrow valley with rising grounds on either side. This locality had been distinguished from an early period, as it abounded in ancient remains of Roman buildings, ecclesiastical and baronial structures, cairns and tumuli indicating the site of feuds and more formidable conflicts. In drawing attention to the Abbey buildings he would remark that where they now stood was not the site of the original monastery of Melrose, which was situated at Old Melrose, nearly two miles further east. The site was still pointed out as the Chapelknowe, but not a vestige of the buildings remained. Some carved red stones were dug up there a few years ago, indicating that the more recent buildings were in the Norman style. In the earliest period Bede stated that the churches were all of oak and thatched with reeds. The old Abbey was supposed to have been founded towards the end of the sixth century and afterwards dedicated to St. Cuthbert, its third abbot. It continued to be recognised as an abbey till 1136, when the present one was founded; afterwards it was referred to as St. Cuthbert's Chapel. The early ecclesiastics in the middle of the twelfth century were merged into the Austin Canons, the order which they most resembled, and were afterwards only noticed occasionally until about the middle of the fourteenth century, when they finally disappeared. The present Abbey was considered to have been a new institution, founded by David I. in 1136. None of the buildings of the period, if they did exist, could be identified, and it was probable that they were not so extensive as the subsequent erection. The Abbey of 1136 was ten years in building, and according to the "Chronicle of Mailros," was dedicated to St. Mary in 1146. It was colonised by monks of the Cistercian order from Rievall, in the North Riding of Yorkshire, who were the first of the order introduced into Scotland, and continued as its head while it existed in this country. The "Chronicle of Mailros" was begun by the order establishment in 735 and continued down to 1270. The remains before them appeared to have belonged to buildings erected after the demolition of David I.'s structure in 1322. Between this date and 1510 the present abbey had arisen, which continued the Cistercian arrangement. There was one exception here to the general rule, by placing the garth or cloister court upon the north instead of the south side of the church. There were, however, examples of this deviation in England, as at Gloucester, Dore, and St. David's, &c. It had been remarked that it was difficult to trace the progress of the styles in Scotland, on account of the sudden transitions that existed occasionally in the same building, but this was readily accounted for, from the frequent destruction of these during the inroads from England. The church presented unity of interest throughout, and as religious teaching and education was committed to its care, it became necessary, even for the Church's existence, that her establishments should be placed in an efficient state as early as possible. The buildings were therefore restored according to the best examples, whether in style or arrangement. If the political situation of this country was such as to admit of architects or master masons being got from England, English features appeared; but if not, these were obtained from France. Thus they had in Melrose work of English character up to 1385, when the Abbey was partially destroyed by Richard II., and from this period until 1510 the work in some places showed indication of French features. The Abbey suffered many reverses, amongst the most prominent being its destruction in 1322 by Edward II. In 1385 it was burned by Richard II., and in 1545 it was literally destroyed, with the best of its outlying buildings, by the Earl of Hertford. To secure a portion of the nave to be used as a parish church the plain buttresses and sub-vaulting were introduced into other fittings in 1618, and continued in use till 1810. Behind the altar is the resting-place of the heart of King Robert the Bruce, which was placed there after being brought back from Andalusia in 1330. Upon the south side is the grave of Alexander II., upon the north the graves of the Douglasses—"the dark Knight of Liddesdale, and the hero of Otterburne." In the small chapel to the south of the altar is the grave of Sir Ralf Evers, and nearest the wall that of Sir Bryan Latoun (sometimes said to be that of

Michael Scott, the wizard), who were killed at the battle of Ancrum Moor in 1545. At the entrance to the cloisters is the burial-place of the house of Yair, and opposite to it are the graves of the Kerrs of Keppilaw.

Mr. Micklethwaite, pointing to the rich and elaborate carvings of various parts of the ruins, said it was an extraordinary place for the order of Cistercian canons, who in their churches aimed at being plain. He described the subsidiary buildings, and from the chancel pointed out the doorways in the transepts and aisles, and described the buildings into which they led. In the guide-books the positions of the nave and choir had been reversed. The choir was really on the other side of what was said to be it. In the exterior view of the east window there were two figures which were said to be those of David I. and his Queen Matilda. He did not think the figures were correctly described. His opinion was that the figures represented the crowning of the Virgin.

#### Dryburgh Abbey.

Mr. Kerr read a paper in the Cloister Court of the Abbey. He said the name Dryburgh was derived from the Celtic Daroch-Bruach, which signified the Oak Grove. A colony arrived here about 522 under a presbyter, whose name was Modan, and founded a settlement of Christian missionaries. The Abbey was founded by Hugh de Morville and his wife Beatrice Beauchamp, with the concurrence of David I. It was colonised from Alnwick by monks of the Premonstratensian Order, following chiefly agricultural and literary pursuits. The buildings were first occupied on St. Martin's Day 1141, and dedicated to St. Mary. In 1150 the cemetery of St. Martin was consecrated in order that "foul spirits might not walk therein;" and a second cemetery was added in 1208. Besides the abbey buildings there were remains of a corn mill and brew-house with some other ruins. The old graveyard was upon the north side of the church, and the site of the altar with that of the village upon the south-east side of it. The buildings of 1150 had been entirely demolished, as the existing ones did not appear to be later than the early part of the fourteenth century. In reckoning from the styles of Scotland it was found that they were about a century later than the corresponding periods in England. The architectural styles were more decidedly marked here than at Melrose. The remains of the buildings upon the east side of the cloister court were Transition Norman. The choir and north transept, and the gable of the south transept of the church were Early English, and the nave Early Decorated. It would also be noticed that the circular arch was retained in all the principal doorways and smaller openings. The abbey buildings being situated upon a slope, required a considerable extent of stairs to communicate with the various apartments. Sir Walter Scott was buried in St. Mary's aisle.

Mr. Micklethwaite said that though the place did not belong to the Cistercian order, it really gave a better idea of what a Cistercian place would be than the gorgeously-carved architecture of Melrose Abbey. It belonged to the order of canons, corresponding to the order of monks; they were Augustinian canons, and corresponded to the Benedictines in their way. He did not think they were so strict as the Cistercians, but they went in for perfectly plain buildings. He pointed out where the various buildings stood, and described the rooms into which the doorways before them in the cloister court led. From the passage, which would probably lead to the infirmary, there was a door to the left which led to one of the most interesting rooms of the place, a very good example of the common room. The people did not warm the place with hot water in these days, but they had a large fire in winter in this common room, to which the canons had access, and where when they were cold, which they did not seem to care much about, they went and warmed themselves. This seemed to have been altered in later days. In an arch behind them were the remains of the lavatory, in which the canons washed themselves before going into the frater, the site of which was on their right. The building near them was called the Cellarium, and it was now in a very ruinous condition. In the lower part there must have been storehouses; he did not think there were any dungeons. The prisons for the offenders of their own order were always in the infirmary. He advised them to go and see the common room and the chapter-house. The latter was very perfect indeed. They would see the benches all round, with the rather superior bench for the big man.

The proceedings were closed by a meeting held in the assembly rooms of the County Hotel, presided over by the Bishop of Carlisle.

The temporary loan museum organised on occasion of the Congress contained a good collection of implements of the Stone Age, British urns, Celtic weapons and ornaments, including a gold torque found in Carlisle; Roman bronzes, brooches, and sandals; old books and manuscripts, and among these the magnificently-illuminated altar missal formerly belonging to Calbeck Church, now in the possession of the Roman Catholic chapel at Warwick Bridge. The walls were hung with portraits and other historical pictures from Muncaster Castle, Greystoke, and other private collections, among which were several portraits of Mary Queen of Scots; one of Skelton, the famous "Fool of Muncaster," in his motley garb; a portrait of Erasmus, by Holbein; and a head of St. Thomas of Canterbury, by Van Eyck, cut out of a larger picture

at the time when all memorials of St. Thomas were destroyed. The collection of ancient church plate from all parts of the diocese included a lovely fifteenth-century chalice from Old Hutton, that bequeathed to St. Bees by Archbishop Grindal, and some curious little beakers without a stem or foot. A collection of gems from the Greek and Roman sites of Dalmatia and the east coast of the Adriatic was lent by Mr. Arthur Evans. Among the Greek gems are a faun holding an amphora, a passant lion, and Dædalus presenting Icarus with wings. The Roman series contains examples of portraiture, notably a carnelian head of Antoninus Pius. A remarkable intaglio represents the personification of the city of Salona. There were also a few Christian designs. On one the Good Shepherd is seen opposite an amphora symbolising the waterpots of Cana, with the Christian monogram above. Another shows St. Veronica holding the icon, and a large amethyst from Ravenna bears a full-length portrait of Christ.

### THE NATIONAL PORTRAIT GALLERY.

THE 25th annual report of the trustees of this gallery was issued on Wednesday. The total number of visitors during 1881 was, according to the report, 84,533, being 8,423 in excess of the number of the year before. The number of visitors on the Bank Holiday, August 1, 1881, was 3,037, against 2,206 of the previous August. On Boxing Day, December 26, 1881, the visitors numbered 1,619, against 1,690 of the year before. The number of visitors on Easter Monday 1882 amounted to 2,851 against 3,584 of the previous year. On Whitsun Monday in the present year the number of visitors was 2,388, against 3,528 of last year. The number of visitors during the first six months of the present year was 39,200. The number of visitors to the Gallery, from the commencement in Great George Street, Westminster, to the end of last year, was 1,053,103 and the total number of visitors during the last ten years, 749,046. The donations during the year have been as follows:—William Page Wood, Lord Hatherley, painted by George Richmond, R.A.; H.R.H. Edward, Duke of Kent, K.G., by Sir William Beechey, R.A.; H.R.H. Frederick, Duke of Sussex, K.G., by Guy Head; John Rennie, F.R.S. (a bust sculptured in marble), by Sir Francis Chantrey, R.A.; Margaret Woffington, painted by Arthur Pond; Dominic Serres, R.A. (a small sketch on paper, or full-length figure washed upon in sepia and Indian ink); Earl of Beaconsfield, K.G. (small-sized full-length bronzed figure); George Berkeley, Bishop of Cloyne, painted by John Smibert; Sir Francis Chantrey, R.A. (in black and white chalk); heads drawn in outline by Sir Francis Chantrey, R.A., being a series of 100 portraits of celebrated persons drawn from the life. They are executed by means of the *camera lucida*, on large sheets of paper, in lead pencil, some shaded, and mostly of the size of nature; Thomas Carlyle (terra cotta bust), by J. E. Boehm, R.A.; William Hayley (bust); James Watt, painted by Henry Howard, afterwards R.A.; and George Legge, first Lord Dartmouth, painted by Michael Dahl. The purchases comprise the following: Richard Brinsley Sheridan, signed "J. Russell, pinxt., 1788;" Edmund Burke; Nathaniel, Bishop of Durham, painted by John Riley; John King, Bishop of London, by Daniel Mytens; Abraham Cowley, the painter of this is uncertain, as also of John Whitgift; and Sir James Outram, by Thomas Brigstocke.

Two pictures, it appears, were purchased on July 8, 1882, from the Hamilton Palace collection, *King James II.*, painted by Sir Godfrey Kneller, and *Ratification of the Treaty for Peace and Commerce between England and Spain*—a large historical picture representing the English, Spanish, and Austrian plenipotentiaries assembled in an apartment at old Somerset House, August 18, 1604, to conclude a treaty of peace and commerce between the Kings of Great Britain and Spain and the Archdukes of Austria—(James I., Philip III., Albert, brother of the Emperor Rudolf, and Isabella Clara Eugenia, sister of the King of Spain). The names are inscribed on the lower part of the picture in Spanish in two columns, with corresponding numbers and letters near the heads. Those on the left, being foreigners, are distinguished by numerals. Those on the right, the English, are identified by capital letters. Below, on the left, in a deep yellow colour, is written "Juan pantoja dela x f. 1594." There can be little doubt that the name of the artist and date have been subsequently added, although at a remote period. In the year 1594 there was no historical conference, and the titles by which the English nobles are designated in the writing on the picture were not conferred till some time afterwards. The method of painting does not correspond with the known works of Pantoja de la Cruz, who never visited England. He died in 1609. The picture may with probability be assigned to Marc Gheeraedts, who arrived in England from Bruges 1580, and was much employed at court. A small and highly-finished portrait of Queen Elizabeth, standing, with a sprig of olive in her hand, and the sword of justice at her feet, painted by Marc Gheeraedts, signed M.G., is in the possession of the Duke of Portland. His portrait of Camden in the Bodleian Gallery at Oxford is signed in full. Excellent pictures inscribed with his name

are at Woburn Abbey, Barrow Green, Surrey, and Penshurst Place in Kent.

The trustees record the successful completion of the alterations in the upper long gallery specified in their previous report as about to be commenced by her Majesty's Office of Works. The skylights inserted in the sloping roof to the north and south are at a very favourable angle for concentrating light where most required. The screens projecting from the north wall have been heightened and connected with the beams of the ceiling so as to strengthen the construction of the building. They have also been perforated with doorways in order to facilitate the circulation of visitors at holiday times. The walls have been painted in distemper colours to correspond with the rest. It is, however, to be feared that the heterogeneous character of the grouping of pictures and sculptures on the ground floor, more particularly round the eastern staircase, adverted to in the concluding paragraph of last year's report, must be allowed to remain some time longer. The portraits in question have been temporarily displaced from the upper long gallery during the period of alterations. Although the structural improvements are now completed, the replacing the portraits and electro-types, and re-hanging pictures on the newly-gained extent of wall, will be a very costly undertaking, and such funds as might be available for that purpose may now be urgently required to meet the unexpectedly heavy demand for recent purchases at the Hamilton Palace sale. The trustees have to acknowledge the readiness with which the Government have acceded to their request that special facilities might be granted to them for availing themselves of the opportunity of making valuable additions to the gallery from the Hamilton collection. These demands have proved to be in excess of what was originally anticipated. The high price which the trustees have thought it necessary to pay for the conference picture rather than allow it to pass into foreign or other hands, have more than exhausted the funds specially placed at their disposal, which expenditure will have to be met by saving under different heads in subsequent years.

The trustees state in conclusion that they believe that the interest felt in the gallery by the public is in no way diminished, and that the advantages which all classes have derived from the study of the national portraits have more than realised the expectations of those who originated the establishment of the institution.

### THE INSTITUTION OF MECHANICAL ENGINEERS.

THIS Institution opened its summer meeting on Tuesday morning at Leeds. An address was given on the occasion by the president, Mr. Percy G. B. Westmacott, in the course of which he said:—It is desirable there should be from time to time a general survey of progress—some stocktaking, in fact, of work done—some guidance, help, or advice to younger members of the profession—some forecast of the direction in which investigations or improvements or inventions should be pressed—some expression of thought, or reflection, to raise the mind to the higher attributes and duties of our profession; and it is to the chair of our institution that we may very fairly look for the accomplishment of this portion of the work. About this time last year we received from our past-president, Mr. Cowper, a most admirable and concise summary of the recent progress of engineering and scientific inventions; and shortly afterwards, at the meeting of the British Association, another of our past-presidents, Sir Frederick Bramwell, shook down with all his power and generous energy the ripe fruits of his knowledge and experience in engineering and scientific matters during the progress of the past half-century. I shall not attempt to traverse the same ground. Even if I had the power or experience to do so, it must be confessed that this last year has been unusually barren in mechanical inventions; but at the same time many scientific and mechanical appliances are being projected and pressed forwards into use, for the benefit and, let us hope, for the peace of mankind. Reflecting then upon the results of the great and rapid progress in practical science and art that has taken place of late years, there is, it appears to me, a point of significant interest to engineers, and it is this—that the nation or community which applies its inventive faculties, its powers of adaptation and construction, to the moving of materials for useful purposes with the least amount of manual labour and waste—in a word, which extends and cheapens transport by land and by water—is in the van of all real work, substantial progress, wealth, and civilisation. It requires no statistics to prove this—no toy calculations, having for their base some popular formulæ such as the measure of a belt round the earth, or the distance from earth to moon, to call forth comparisons. We have but to glance back at a man in his savage state, living with earth's latent riches around him, and yet incapable of moving these rich materials for his benefit, without the guidance of some higher intellectual and cultivated power. We have but to contemplate the marvellous and gigantic structures of the East, which were erected, at an enormous waste of manual power, for no good or useful purpose to mankind, and thus stand as monuments of man's pride and self-glorification. There was no power of real and bene-

ficent progress in these—no real work. How do we in this country stand in this respect? We may reverse the medal: we have availed ourselves of the natural resources of our land; we have made progress and done good work; but, in all humility we must own, the results of our work and progress have been greatly tarnished and impeded by the savage waste and selfish spoliation of the good things we have moved and lived upon for our benefit. We may pride and plume ourselves upon the vast strides which science, art, and engineering have made in our time; but posterity will assuredly lay its finger upon the great blot of waste, and may stigmatise our age as the Black Age, which has spoilt—by careless, unnecessary, and selfish emissions of smoke and noxious gases—many a noble town and many a lovely spot on earth. The smoke nuisance is altogether inexcusable, and cannot be too severely dealt with. Science and art have practically overcome it; and experience enables many, like myself, to assert that money can be profitably laid out and yield good interest in the abatement of this unpardonable nuisance. Then with regard to waste, much ingenuity and skill have certainly been displayed, and much work has already been done to lessen this evil; and the records of our institution will bear witness that many of our members have striven and succeeded well in their efforts to remove this stigma from our age. I would urge upon the younger members of our profession to study this question profoundly, and as if the whole of their success in life depended upon it; and never to undertake the smallest piece of work without wrapping it round with economy. Those who carry out this advice will assuredly succeed.

A paper was then read by the secretary, Mr. A. H. M. Thompson, of Leeds, on "The History of Engineering in Leeds." In the course of his paper Mr. Thompson said that mechanical engineering appeared to have made but little progress prior to the commencement of the present century. The necessary machinery in the district, whether the motive power was wind or water, was of a very simple character; and the appliances for colliery working, or for the smelting and working of iron, were of a very primitive description. It was about a hundred years ago that improvements in the steam-engine gave an impetus to mechanical engineering throughout the country; and the genius of Matthew Murray soon enabled the Leeds district to take a prominent place in this industry. Having introduced various improvements in machinery, engine building soon became a large branch of his manufacture. Two engines of his make, one of fifty, the other of sixteen horsepower, are still driving machinery at Messrs. Titley, Tatham & Walker's, Water Hall Mills, Holbeck. For one of his engines, sent to Russia, he received a gold medal from the Emperor. So rapidly did his business progress in the North of England, that James Watt found him a formidable rival—so formidable, indeed, that the firm of Boulton & Watt bought up the land round his works to prevent their extension. In 1812, in conjunction with Blenkinsopp, Murray brought out what was undoubtedly the first locomotive engine ever successfully employed for commercial purposes. It was constructed for the conveyance of coal from the Middleton Colliery to Leeds, a distance of about  $3\frac{1}{2}$  miles, and was capable of dragging thirty loaded coal waggons at a speed of between three and four miles an hour. It continued to run for many years. Murray's works were the school in which numbers of engineers of note in the early part of the present century were educated, many of whom started works in Leeds and elsewhere.

On Wednesday, among other papers read was one by Mr. T. R. Crampton on his automatic hydraulic system for excavating the Channel Tunnel. He said this was one of the most prominent engineering problems of the day. His system was founded upon the employment of hydraulic power for driving all the machinery necessary to cut down to the chalk at the tunnel face, and to remove the *débris* out of the tunnel to the surface through pipes to any place where it could be disposed of. He treated the question on the assumption that the whole length of ten miles was executed at a level of 400 feet below the level of the sea, and that the arrangements were such as that the work of excavation and the removal of the *débris* had all to be carried ten miles from the starting-point. A minute explanation was given of the powerful machinery to pump water from the sea; of inlet pipes conducting water under high pressure as a means of driving the cutting machinery, and of the various modes of dealing with the cream or sludge arising from the *débris* or chalk. It was shown how the space lying between the boring machinery and up to the top of the shaft was left entirely free, excepting so small a portion of it as was occupied by the high-pressure water inlet-pipe, and the cream outlet-pipe. After going into details regarding the powers required by the various operations, the size of the inlet and outlet pipes, and other data in connection with hydraulic machinery, Mr. Crampton explained in which way his system afforded facilities for the speedy lining of the tunnel, and a great saving of time and expense. For the men who might hereafter be employed at the boring machinery he proposed to carry sufficient air under compression with the water, which being discharged at certain motors, would keep that part of the tunnel cool and well ventilated. He said for the comparatively slight traffic which would be necessary to carry in the men and materials air locomotives would be employed, and the discharge of air from their motors would ventilate all the space occupied by men working on the lining, and at all events the quantities of air

required for ventilating purposes would be inconsiderable, and a very small pipe would supply them. In conclusion, he observed that the power required by the hydraulic system would not amount to one-third of that required when the chalk was cut in a dry state by compressed-air machinery, and had to be conveyed by air locomotives in trucks, and lifted to the surface by the ordinary means.

## THE DUBLIN EXHIBITION.

THE Dublin Exhibition was opened on Tuesday, and at the same time the unveiling of the O'Connell statue took place at Carlisle Bridge, which in future is to be known as O'Connell Bridge. The statue, which was left unfinished by Foley, has been carried on by Mr. Brock. The structure stands 40 feet high, and consist of three distinct parts. Surmounting all is the figure of the Liberator, 12 feet in height, representing him enveloped in his historic cloak. Next comes the cylindrical drum, bearing fifty allegorical figures in high relief. Of these the principal is Erin, 8 feet high, trampling her cast-off fetters under foot, while with one hand she grasps the Act of Emancipation, and with the other points up to her Emancipator. The other figures are symbolic of the Church, the Professions, the Fine Arts, the Trades, and the Peasantry. Then the third part is the base itself, formed of two gradients. The four winged Victories, which are to project from the corners, are unfortunately absent, owing to the incompleteness of the casting of one. The Victory of Patriotism has seized a sword in her right hand, and bears a shield in her left; the Victory of Fidelity holds a mariner's compass and caresses a dog—both types of constancy; the Victory of Eloquence, with a look all fire and life, clasps a roll of documents; and the Victory of Courage is in the act of strangling a serpent as she grasps a bundle of reeds, typical of the doctrine, union makes strength.

The Exhibition building is situate in the Rotunda Gardens. It is well designed and laid out picturesquely, though with a view to the utmost economy of space. It covers an area of 33,000 square yards, or about two acres and a quarter. The structure is of wood and glass, with corrugated iron for a portion of the walls and roofing. The amount of material used in the construction includes 25,000 feet of scantlings, 35,000 feet of slating and corrugated iron, 26 tons of iron, and 9,000 feet of canvased roofing. As no contractor could be found who would undertake the construction at the estimated outlay or within the time specified, the directors themselves undertook the work, which has been carried out from the plans of Mr. G. C. Ashlin, A.R.H.A. The Agricultural Hall is entirely detached, and situated close to the railings at the north side of the square. The Art Gallery is also a separate house, but connected with the gallery at the north-east side by a passage which runs parallel with the Machinery Department. The latter runs at right angles, and upon the same level with the Central Hall. The chief entrance is at the Cavendish Row side; but there are other doors, one by the Rotunda and one in the south-east corner. The main building or central hall is 250 feet long by 100 feet wide. It is roofed in three spans, the centre span being 50 feet and the two others 25 feet each. There is an apsidal projection in the centre of the east façade 100 feet wide and 50 feet deep, in front of which the main entrance porch is situated. This porch enters on a level half-way between that of the ground-floor and that of the gallery, which runs all around this section of the building. The galleries occupy the side span of the main hall and apse, and are 25 feet wide, the height above the ground-floor being 15 feet, leaving the centre bay of the building open to the roof—a clear height of 53 feet. The Art Gallery is entered by a large passage from the gallery at the north-west side of the main hall. It is 137 feet long by 32 feet wide and 30 feet high. It is lighted entirely from the roof, and has an apsidal projection at one end. The machinery annexe is 150 feet by 100. It is roofed in four bays, each 25 feet wide, divided by rows of columns, brackets being provided on each bay of the shafting which drives the machinery. The roofs are of iron, with a large glass lantern in each space about 30 feet from the ground-floor. The roofs—except in the Art Gallery—are supported on arched lattice ribs of light construction, those in the nave roof being double, with cross lattice work between; and the roof of the Art Gallery has framed principals, having collars and king-posts with moulded ends. The ceiling here is caved on each side, and has a large roof-light in the centre extending the whole length, and being the only light required. The decorations are all in distemper colour in various tints, and the main uprights, gallery front, &c., are decorated with stencil pattern of various appropriate designs. The tints in the main hall are—uprights, brown, buff, and light blue; clerestory framing, white; and gallery front and roof trusses in red, bluish grey, and yellow, the remaining roof timbers being white Xisler; uprights, &c., to correspond with the main hall and roof, in tints of bluish grey and salmon colour. The refreshment-rooms at the north side have boarded ceilings decorated with stencil ornaments, and open out the verandah. The Art Gallery has been decorated in a quiet tone, the walls a light chocolate and the ceiling a light blue, the roof and cornice being buff. The exhibits are numerous, and chiefly of an industrial character. Many are of the highest class. The machinery department is well filled, and contains specimens of

Dublin manufacturers' design and work. Every important Dublin firm is represented, and there is scarcely any industry established, at all events in the midland and southern districts of the country, that is not amply illustrated.

Various schools of art are represented in the Picture Gallery, and the works of known living Irish painters are abundantly illustrated. Besides foreign canvases there are works also by Sir Joshua Reynolds, Sir Thomas Lawrence, Creegan, Hamilton, M<sup>r</sup> Manus, MacLise, Edwin Hayes, Smith, Sharpe, Nichol, Watkins, Duffy, Shiel, Gray, and Marquis. In addition to special contributions of pictures in the possession of private families, there are many works by the younger Irish artists. On the wall facing the entrance are hung almost exclusively paintings by Irish artists. Facing them are hung in sections works of the foreign schools and portraits by the great English masters; and at one end of the room is suspended the great painting by John Fergus O'Hea, *Punchestown*, 1868. Along the centre of the room stand the marble sculpture and casts by Foley, Hogan, and the Farrells.

#### BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE thirty-ninth annual congress of the Association will take place at Plymouth on Monday, the 21st inst., terminating on Saturday, the 26th. There will be three extra days, however, for the purpose of paying a second visit to Cornwall, beginning on Monday, the 28th, at Liskeard, and ending there on Wednesday, August 30.

The Duke of Somerset, Lord-Lieutenant of Devon, has accepted the office of president, and the following sketch of the proposed programme of excursions, &c., has been arranged:—

Monday, August 21.—Reception by the Mayor and Corporation in the Guildhall, and delivery of the inaugural address by the Duke of Somerset, K.G., President of the Congress. Visits afterwards to be made to the churches, old buildings, and antiquities of Plymouth, under the guidance of Mr. R. N. Worth, F.G.S.

Tuesday, August 22.—Visits will take place to Buckland Church and Abbey, which will be commented on by Mr. E. P. Loftus Brock, F.S.A., and others; thence by Devil's Bridge to Princetown, the Cyclopean Bridge at Blackbrook, the pre-historic remains near Merivale Bridge, consisting of hut-circles, avenues, menhir, sacred circle, and to Tavistock. Evening meeting at the Athenæum, Plymouth, for the reading and discussion of papers, &c.

Wednesday, August 23.—A visit will be made to Totnes, where the party will be received by the Mayor and Corporation, and then proceed to visit the castle, after which the party will proceed by the river steamer down the Dart for Dartmouth, and inspect the church of St. Saviour, its carved stone pulpit and celebrated carved wood screen; then to Butter Walk for examination of curious old houses there. Evening meeting at the Athenæum at Plymouth.

Thursday, August 24.—A visit will be made by Tavistock over Black Down, by Mary Tavy to Lydford, for inspection of remains of castle, the church and, curious tombstone in churchyard, also the ancient earthwork, which will be commented on by R. N. Worth, F.G.S. Afterwards by way of Brent Tor, with its Church of St. Michael; thence by Kilworthy House, formerly the seat of the Glanvilles, to Tavistock, where the church, the refectory, Betsy Grimbal's Tower, and other remains of the Abbey, as well as the Ogham and other inscribed stones in the vicarage gardens will be inspected. Evening meeting at the Athenæum.

Friday, August 25.—By Totnes to Berry Pomeroy Church, mansion, and castle, and remains of Tudor House, all of which will be commented on and described; Compton Castle, and thence to Torquay. Tor Abbey will be examined and commented on by Mr. E. P. Loftus Brock, F.S.A., Mr. George Patrick, and others. Evening meeting at the Athenæum.

Saturday, August 26.—Slade Hall and drive by Cornwood and Harford to Fardell, formerly the seat of the Raleighs; and thence to Ivybridge, returning by way of Plympton, for the examination of the churches of St. Mary and St. Maurice, the remains of the priory and castle, &c., under the guidance of Mr. J. Brooking Rowe, F.S.S. Closing meeting at the Guildhall, Plymouth.

The following gentlemen have promised papers for the Congress:—Mr. C. Spence Bate, F.R.S.; Mr. E. G. Bennett, on "Robert Blake, 1656"; Mr. T. R. A. Briggs, F.L.S.; Mr. Walter de Gray Birch, F.S.A., on the "County Seals"; Mr. E. P. Loftus Brock, F.S.A., on "The Peculiarities of the Churches of Devonshire, St. Germans," &c.; Mr. William H. Cope, on "Old Plymouth China"; Mr. C. W. Dymond, F.S.A., on "The Hurlers, Trethevy Stone, and Duloe Stone Circle"; Mr. James Hine, F.R.I.B.A.; Mr. Thomas Morgan, F.S.A.; Sir James A. Picton, F.S.A., "Glimpses of Municipal Life in the Olden Times"; Mr. J. Brooking Rowe, F.S.A., on "Plympton Castle and Churches," &c.; Rev. J. Erskine Risk, M.A.; Rev. W. S. Lach-Szyrma, M.A.; Mr. John Reynolds; Mr. R. N. Worth, F.G.S., president of the Plymouth Institution, on "The Antiquity and Antiquities of Plymouth," and on "The Plymouth Municipal Records"; Mr. George R. Wright, F.S.A., "Fardell, the Family Seat of the Raleighs"; Mr. Francis Brent, "On a Group of Prehistoric Remains on Dartmoor hitherto undescribed," &c.

#### LONDON THEATRES.

AT the last meeting of the members of the Metropolitan Board of Works prior to the usual autumn vacation, held on Friday last week, a sum of 150*l*. was allowed by the Board to meet the extra expenses incurred by the officers and men of the Fire Brigade who were employed under the chief officer in the work of inspecting the London theatres. The Building Act Committee reported that in their opinion it would not be practicable to make any general regulations under the provisions of the 45th section of the Metropolitan Board of Works (Various Powers) Act, 1882, authorising the Board to require the means of exit from theatres to be kept open. The Committee, however, recommended that a reference be made to them, instructing them to frame and submit to the Board from time to time, for approval and adoption, special rules with respect to the times during which, and the conditions under which, the doors of each of the theatres and music-halls of the metropolis should be kept open, the persons to be charged with the duty of closing and opening the same, the nature of the fastening of such doors, and the notices to be posted in each building specifying the means of exit.

With reference to the application of Mr. T. Verity, on behalf of Miss K. Santley, for a certificate by the Board, as required by the Metropolis Management and Building Act Amendment Act, 1878, in respect of the reconstruction of the Royalty Theatre in Dean Street, Soho, the Building Act Committee recommended that the applicant should be informed that the plans did not comply with the Board's regulations, and that therefore the Board were unable to grant the application; and that the applicant should be also informed that, unless the site were improved, the Board would feel it necessary to advise the Lord Chamberlain not to issue his licence in respect of any theatre that might be erected thereon.

The several recommendations of the Committee were adopted.

#### MR. WARWICK BROOKES.

THE death is announced of Mr. Warwick Brookes, of Manchester, on Friday evening, the 11th inst., at his residence, Egerton Grove, Stretford New Road, in the seventy-third year of his age.

In the death of Mr. Brookes we believe (says the *Manchester Guardian*) we are not in the least exaggerating when we say that Manchester has lost one of the most distinguished draughtsmen and one of the most accurate and delicate limners of the human form and face she has ever produced. In artistic circles we have every reason to believe that this opinion will be generally endorsed. Mr. Brookes was born in the neighbourhood of Birtle's Square, Salford, about 1809. At a very early age he was employed in the then well-known Broughton printworks of Messrs. John Barge & Co., to which firm he was subsequently apprenticed as a pattern-designer. After serving his apprenticeship, and being some time in the employ of Messrs. Barge, he was engaged for a short period by another firm of calico-printers, ultimately entering into the service of the Rossendale Printing Company, with which firm he continued until some few years ago, when the weak state of his health incapacitated him for the prosecution of his ordinary business. At an early age, however, he imbibed a taste for drawing which developed itself in a marked degree during the remainder of his life. One of the first men to recognise his genius in his drawings of the human figure was the late B. R. Haydon, who, upon his first visit to Manchester, saw the works of the young pattern-designer, and commended them in the highest terms. Among the earliest work which Mr. Brookes exhibited was at the Royal Institution in 1849, to which he sent a series of exquisite sketches illustrating the "Journal of a Poor Vicar." In 1850 he sent two capital examples, *The Mendicants* and *Street Music*. He was subsequently an occasional exhibitor at the autumn exhibition of the Royal Institution, but never sent more than one or two examples to each exhibition. His sparseness in quantity, however, was more than redeemed by his undoubted richness in quality. His sketches and studies, especially of children, were always eagerly sought for on our Institution walls alike by the admiring connoisseur and critical artist. Some of his sketches of children, we believe, were purchased by the Queen. The little old man was shy and retiring to a degree, and never seemed to care to court popular applause by the works he exhibited. When urged to produce larger and more pretentious work, he would calmly reply that he was perfectly satisfied with the scope of his genius. In 1868 he was elected a member of the Manchester Academy of Fine Arts, of which he continued a member until last year, when he resigned. To the spring exhibition of the Manchester Academy he generally contributed one or two of his exquisite drawings. Owing to his incapacity through sickness for either following his business as a pattern-designer, or in the close prosecution of his profession as an artist, representations were made, mainly at the instance of Dr. Samuel Crompton, to Mr. Gladstone that Mr. Brookes was fairly entitled to a pension from the Civil List. The Premier was thoroughly satisfied with the claims of the old artist, and recommended her Majesty to grant him a pension of 100*l*. per annum.

which was made on April 24, 1871, "in consideration of his talent as an artist." In private life and among his artist friends Mr. Brookes was greatly admired, not only for his high ability as an artist, but also for his kind disposition and readiness to impart his own long and valuable artistic experiences to all who sought his counsel and advice.

### CRYSTAL PALACE SCHOOL OF ENGINEERING.

THE certificates awarded by the examiners to the most successful students during the summer term were distributed on Saturday last in the school, in the south tower of the Palace, by Sir James Nicholas Douglas, C.E., Engineer-in-Chief to the Trinity House, and Member of Council of the Institution of Civil Engineers. The report of the examiners, which was read by Mr. Shenton, the superintendent, stated that the number of students who had attended the lecture examination on railway and dock work was thirty-six, of whom twenty-one were eligible for examination, and of these sixteen had passed; that the division of civil engineering and the drawing office of the mechanical course showed by the results attained the value of the system of instruction practised; and that the workshop practice, as exemplified by the specimens of fitting and patterns, was highly creditable.

Sir J. Douglas said this was the first time that he had visited the school, and he had been highly gratified by the way in which everything was carried on in it. He was sure they would all have been gratified by the report of the examiners. It was his good fortune to commence his career in the workshop. He had four years of it, and he had always considered it the backbone of his career. There was no royal road to engineering. They must make up their minds to a life of thoroughly earnest hard work, and if they did, and they had ordinary ability, they would probably succeed. The life of an engineer was one of noble enterprise; he came in contact with all the great forces of nature, and it was his duty and his privilege to tame those forces, and to utilise them for the benefit of mankind and the progress of civilisation. Therefore no nobler career could be opened before a young man, and to begin that career well he must begin it in a well-regulated workshop. He asked them to avail themselves of the splendid opportunity afforded to them there of acquiring a thoroughly practical training. In acknowledging a vote of thanks given to him for his address, Sir J. Douglas said in the early days of the Institution of Civil Engineers it was thought that forty or fifty members would be a good number, and that they could do all the work that was required, but now there were more than two thousand members, and there was room for fifty times as many.

### UTILISATION OF SMOKE.

AT Elk Rapids, Michigan, is a blast furnace in which are manufactured fifty tons of charcoal iron per day. There are twenty-five charcoal pits, constructed of brick. Each pit is filled with 100 cords of hard wood and then fired. The vast amount of smoke from these pits, which was formerly lost in the air, has now been utilised by Dr. Pierce, a chemist. Chemical works have been erected, which are thus described by the *Boston Courier*:—First, they have a circular tube made of wood, with pine staves 16 feet in length, bound together with heavy iron hoops. This tube is placed directly over the pits in a horizontal position, with an opening from each pit into the tube. At the end nearest the building there is a large drum containing a rotary fan propelled by machinery, the power of which is gas. That acts as a suction or draft for the smoke, which is conveyed into five stills filled with copper pipe 2½ inches in diameter. The boxes in which the pipes are situated are 20 feet square, 8 feet deep, made of heavy pine, and filled with cold water; these are all connected by copper pipes; they are connected with the main still, 100 feet in length, 10 feet wide, 8 feet deep, filled with copper pipes 2½ inches in diameter in a horizontal position, surrounded with cold water, from this conveyed to a purifier, from which runs what is called pyroligneous acid, which is as clear as amber, with an unpleasant odour. From the acid is produced, first, acetate lime; second, alcohol; third, tar; the fourth part produces gas, which is consumed under the boilers. Each cord of wood contains 28,000 cubic feet of smoke; 2,800,000 feet of smoke handled every 24 hours, producing 12,000 pounds acetate of lime, 200 gallons alcohol, 25 pounds tar. These articles have a commercial value in the manufacturing of various articles. The alcohol has been contracted to a firm in Buffalo, New York, for five years, they furnishing the packages and receiving it at the works at 80 cents per gallon. The smoke from 40,000 cords of wood consumed per annum is thus made a source of much profit, as the works are nearly automatic.

The Rochdale Town Council have decided to pull down the spire of the Town Hall, which is nearly 70 feet high above the stone tower, owing to the whole structure, which is timber covered with lead, being in a rotten and dangerous state. The erection was completed about eleven years ago.

### THE ART UNION OF LONDON.

THERE is now on view at 112 Strand an interesting collection of pictures, being the forty-sixth annual exhibition of the works selected by the successful members of the Art Union of London in the drawing of the present year. The catalogue contains between eighty and ninety pictures, ranging in value from 100*l.* to 10*l.*, which have been chosen by the respective winners from the walls of the Royal Academy, the Society of British Artists, the Grosvenor Gallery, the Royal Hibernian Academy, the Royal Scottish Academy, the Royal Society of Painters in Water-Colours, the Institute of Painters in Water-Colours, the Royal Albert Hall, and the Society of Lady Artists. With few exceptions the pictures are exceedingly good, and show no small amount of taste on the part of those whose task it was to select them. One of the first the visitor comes across is a picture entitled *Sleep*, by Mrs. Laura T. Alma Tadema, showing the listless form of a young girl who has apparently dozed off in the middle of her work of stocking knitting, while a large book has fallen on her lap, and lies open at her feet. This picture has been drawn from the Royal Academy as a 75*l.* prize. Further round, one is struck by a small picture from the S.B.A., by G. S. Walters, called *The Mist of the Morning*, in which two smacks at anchor are gradually becoming visible through the early haze rapidly disappearing under the influence of the rising sun. Mr. Walter Stacey's *Boys will be Boys*, a capital painting, has been chosen from the S.B.A. as a 60*l.* prize, and attracted a good deal of attention from visitors yesterday; as did also *A Waterfall on the Dulus* (75*l.*), by J. B. Smith, from the same gallery. The most important prize is that to the value of 100*l.*, which this year has been won by Señor L. De Ysasi, and selected from the S.B.A. by him, in the shape of a picture by G. A. Holins, *Mothers and Children*. It represents a young woman standing at a farm gate, and dandling her infant before a she-goat and her two kids, which contemplates the little urchin in mild wonder, the whole forming a very pretty and interesting group. Besides the picture prizes, all of which are well worth visiting the Strand to see, a large number of sculptures, vases, and china tazzas are given away, specimens of which may be inspected in the same rooms as the pictures. The exhibition will remain open until September 2.

### THE CHANNEL TUNNEL.

MR. JUSTICE NORTH sat as Vacation Judge on Wednesday in Vice-Chancellor Hall's Court, Lincoln's Inn, when the application of the Crown for sequestration was mentioned. The action was that of the Attorney-General *v.* The South-Eastern Railway Channel Tunnel Company and others, and the motion was for sequestration, on the ground that boring had gone on in violation of the undertaking given by the defendants when the matter recently came before Mr. Justice Kay for an injunction to restrain the boring, and for an order for inspection. On the motion being called on Wednesday Mr. Dundas Gardner said the Attorney-General and Mr. Littler, Q.C., were now in conference with the view of arranging terms, and the matter would be mentioned later on, with his lordship's permission. Later in the day the Attorney-General said Mr. Littler, who appeared for the defendant company, and himself had spent the interval in bringing the matter in dispute to a determination. He had obtained from his learned friend an undertaking that the boring-machine should not be used again for any purpose whatever. Having obtained this positive undertaking, he felt that he ought to be satisfied, and therefore asked his lordship to allow the motion to stand over *sine die*. The motion was therefore adjourned *sine die* in terms of the Attorney-General's application.

### CHURCH BUILDING AND RESTORATION.

Killearn.—A new parish church for Killearn has been opened. The length of the building over the gables is 96 feet, the breadth 41 feet, and the transepts measure 15 feet long by 27 feet broad. The general character of the architecture is Gothic of the Early English type. The nave roof, which is supported by open timbers, is lined throughout with pitch pine between rafters, that are supported on purlins stretching between carved and moulded principals. These principals spring from moulded wood corbels set in the walls, and borne on small polished stone shafts, with ornamental caps and bases, standing on carved stone corbels. The transepts have also open timbered roofs of similar design, though somewhat simpler, the ridge being lower than that of the nave. There is accommodation for 600 persons. Messrs. D. & J. Bryce, of Edinburgh, are the architects. The contractors for the various works were:—Mason-work, Mr. A. Stuart; joiner-work, Mr. R. Shillinglaw, Edinburgh; painter and decorators' work, Messrs. J. Ballantyne & Son, Edinburgh; slater-work, Messrs. J. Morrison & Son, Glasgow; plumber-work, Messrs. Burn & Baillie, Edinburgh; plaster-work, Mr. J. Annan, Edinburgh; glazier-work, Messrs. Alex. Cunningham & Co., Edinburgh; heating apparatus, Messrs. J. Combe & Son, Glasgow. The tower bell has been made by Messrs. J. C. Wilson & Co., Glasgow.

**Colwyn Bay.**—The corner-stones of a chapel, schools, and minister's manse have been laid. The material used for chapel and schools is Yorkshire stone, with local stone dressings. The chapel will accommodate about 700 worshippers, and has on the west side a tower and spire rising to a height of 140 feet. It is in the form of a Latin cross, and consists of a nave, aisles, and transept, and a polygonal chancel. The architect is Mr. Robert Curwen, London and Liverpool. The contractors are Messrs. Foulks & Son, of Colwyn Bay, and the amount of the contract is about 6,000*l*.

**Cockington.**—The church of Cockington, situated in the park of Cockington Court, is to be thoroughly restored, under the direction of Messrs. Hine & Odgers, architects, Plymouth. The works will include the setting upright portions of the arcades, the removal of the west gallery, the removal of all plaster from the walls internally, the restoration of the screen and pulpit, and fitting the choir and aisles with carved oak stalls and seats. Several ancient bench ends will be re-used. The church contains a font, the gift of Robert Cary, as recorded on a brass still affixed to the masonry, and on the surface of the font may still be seen the remains of the original polychrome with which it was adorned. In the upper part of the tower is a room with a fireplace, supposed to have been occupied in pre-Reformation days by the serving priest.

**Sedgley.**—The foundation-stone of a new chancel for the church of St. Mary the Virgin has been laid. The new erection will provide additional accommodation for 80 sittings. On the north side of the chancel space is left for an organ-chamber, and on the south side for two vestries. At present only the chancel is being proceeded with. The erection will be in keeping with the church, of red bricks, faced with Gornal stone. The work is being carried out by Messrs. J. Jones & Son, Sedgley, from plans by Mr. T. H. Fleming, Wolverhampton.

**Wotton-under-Edge.**—At a public meeting held to take into consideration the restoration of the parish church, it was determined that the work should be carried out according to the plans and recommendations of Mr. F. S. Waller, diocesan architect. Among the works proposed it is recommended that the galleries should be taken down, and that the tower-arch and window be thrown open; the dressed stonework of the windows, piers, and arches be cleaned, and the plastering on the walls be made good; the windows, where the stonework is displaced or perished, carefully restored; the chancel to be re-arranged; the stonework of the walls, windows, doorways, &c., outside, to be properly repaired.

**Arkingarthdale.**—The foundation and memorial stone-laying took place on Bank Holiday of a new Wesleyan chapel at Arkingarthdale, North York, of which Messrs. Leeming & Leeming are the architects. The design is in the classic style of architecture, accommodation being provided for 345 persons at 2*s*. each. The masonry work is let at per schedule to Mr. J. Smith, of Arkingarthdale, but the other works are unlet, being now in process of tendering.

**Alfreton.**—Plans have been prepared for a new Wesleyan chapel to be erected in High Street, Alfreton, and the contracts have been let. It is intended to build a chapel, with schoolroom and classroom on the ground floor, and rooms for service on the second floor to accommodate 150 worshippers. The front of the building is to be of Mansfield pressed brick, faced with stone. The timber for seats and rostrum, &c., is red deal and red fir. The tender of Messrs. Goodall & Dennis, of Pinxton and Kirkby, for 351*l*. has been accepted. Mr. John Wills, of Derby, is the architect.

## ART WORKMANSHIP.

**Brass and Bronze Work.**—Messrs. Crichley, Westley & Co. have completed an elaborate brass fender to the order of a foreign potentate, and which is one of the most remarkable works of its class. It was designed by Mr. John Ward, and the style is Renaissance. The fender is made of brass with the exception of a sub-base of bronze, and figures of mermaids at the corners and a mask face in the centre, also of bronze. The combination proves in this instance a most effective one. The bases are richly ornamented with worked mouldings and banded reeds, surmounted with bronze figures of mermaids facing opposite directions, and occupied with their traditional toilet arrangements. From the tail of these figures grows a bracket or support on to the top rail of frieze, ornamented with raised leaf-work and scrolls. The frieze, or portion between the bases, comprises elaborately-worked mouldings with fluted and ornamental interior space, the corner of which is enriched with an exquisite mask in bronze with a polished brass frame. The whole fender is mounted upon a bronze sub-base about 5 feet 6 inches in length, and the extreme height is 20 inches. The ashpans comprises enriched mouldings with a frieze like to that of the fender, with a similar mask in the centre, but of smaller dimensions. The fire brasses are also of special design in polished brass ornamented with richly-worked swells and bronzed dolls or heads. The tongs open from a square box by means of spring handles. The pan of the shovel is ornamented with *repoussé* work *en suite* with the ornament on box of tongs. The suite complete will cost about 100*l*.

**A Painted Window**, of five lights, with rich tracery, has just been erected in Whittingham Church, Alnwick. The centre light has a figure of our Lord as the Good Shepherd, supported on each side by the four evangelists; the figures, being life-size, are set on richly-coloured backgrounds; under each figure are appropriate emblems. The tracery is filled with foliage, the central or larger piece having a representation of a dove, with rays of light. The colouring is full yet harmonious, and the work has given great satisfaction to the subscribers, who have placed the window in the church to the memory of the late vicar. The work was executed at the West of England Stained-glass Studio, Stonehouse, Plymouth.

**A Painted Window** has just been erected in the church of Islington near Lynn, containing the subject of Mary at the feet of Jesus, and below it a memorial brass with the arms of Bagge impaling Keppel. They have been executed by Mr. Taylor, of Berners Street, for Mr. Thomas Bagge, in memory of his wife, who was a descendant of the Earls of Albemarle.

## TOWNS IMPROVEMENT.

**Thoroughfare between Oxford Street and Charing Cross.**—Steps have at length, says the *Times*, been taken for making, at all events, a beginning of this long-needed public improvement. The materials of about forty houses about Newport Market have lately been sold by Messrs. Eversfield & Horne; the structures themselves are in process of demolition, and in the course of another month a large portion of the following streets will have disappeared:—Newport Court, Little Newport Street, Market Row, Market Street, Prince's Row, Lichfield Street, Hayes Court, and Grafton Street. The market itself was named after the Earl of Newport, on whose land it was built. It was hereabouts, according to Mr. W. Thornbury's "Old and New London," that the famous "Orator Henley" held his mock-preachings; and, if we remember right, the celebrated Horne Tooke was the son of a poulterer—or, as he himself used to say, of a "Turkey merchant"—in Newport Market.

**Hyde Park Corner.**—It has been decided that when the arch at Hyde Park Corner is removed, in accordance with the plan of Mr. Shaw Lefevre, which has just received the assent of the House of Commons, the statue of the Duke of Wellington shall not be replaced upon it. Those who remember the placing of the statue in its present position are aware that the act was then declared to be merely experimental, and that the public taste immediately pronounced very strongly against the appearance presented by the horse and rider; a principal cause of objection being that they were set lengthwise on the arch instead of across it, as is usual in such structures. But it was easier to set the Duke on the arch than to bring him down, and for a generation past he has kept his place amid the indifference rather than the admiration of Londoners. A new site will now have to be found for this colossal work of art. It was the production of Matthew Cotes Wyatt, who had a considerable reputation in his time, and was placed in its present position in 1846. The cost of it was defrayed by a large public subscription.

## ARCHÆOLOGY.

**The Somersetshire Archæological Society** on Thursday closed a three-days' meeting in the neighbourhood of Chard. On Wednesday the Roman villa at Walford, Whitestanton Church, camp, and manor-house were prominent on the programme. Mr. E. A. Freeman, D.C.L., Bishop Clifford, Sir A. H. Elton, and the Rev. H. M. Scarth have been amongst those who contributed papers, and a local museum added to the attractions of the gathering. The Society contemplates the publication of a "*Bibliotheca Somersetensis*," the MS. of which has already been prepared by the hon. secretary, who has been engaged twenty years on it, and the Dean of Wells (Dr. Plumptre), who has taken part in the proceedings, said he looked forward with great pleasure to the appearance of this work. The Committee of the Society have, under instructions from them, directed attention to the pathways of roads leading to Taunton Castle.

**Guildhall Museum.**—A collection of old views of celebrated City buildings of the past has been placed in the annexe room adjacent to the above-named rendezvous in Basinghall Street, which will be found of much interest to those with antiquarian tastes who like, while seeing how they appear in this improving age, also to see how they appeared in their forefathers' days. The following is, according to the *City Press*, the list of the places illustrated:—Westminster Hall and Abbey; Lord Nelson's funeral procession by land and water; Crypt within Aldgate, pulled down in 1872-73; Old Royal Exchange, Cheapside Cross; Gerard's Hall, Basing Lane, Bread Street; Inside Guildhall, 1690; Exterior of Old Guildhall; Crypt of Bow Church from north side near the east end of nave; St. Bartholomew Church, Royal Exchange; St. John's Gate, Clerkenwell; Pye Powder Court, Cloth Fair; Crypt on site of the late College of St. Martin's-le-Grand; Ruins of St. Leonard, Foster Lane; Royal Palace (called Placentia), East

Greenwich; Old Palace, Hampton Court; True and exact prospect of the famous City of London from St. Marie Over's Steeple in Southwarke, in its flourishing condition before the fire; another prospect of the said City from the same place as it appeareth now after the said Calamitie and Destruction by fire in the year MDCLXVI.; Egyptian Hall, Mansion House; the exterior of the Mansion House, with what was called Noah's Ark on the top of it, since pulled down; Sir Paul Pindar's Lodge or Garden House, Half Moon Alley, Bishopsgate Street; Old London Wall.

### SANITARY WORKS.

**The "Sanitary Engineer,"** of New York, says that the first case of persistent violation of the plumbing law in that city, after a warning had been sent, has resulted in a victory for the Board of Health. Although there have been upwards of two hundred notices of violation sent to the owners of houses of which the plumbing or drainage had been found by the inspectors not to conform to the regulations, no one has before cared to defy the Board and test the law. In this case the house drain was of earthenware with defective joints; the soil-pipes also had very defective joints, the traps were unventilated, and in many other respects the work was in violation of the requirements. The owner paid no attention to the notices of the Board, and proceeded to complete the houses. Accordingly the Board put the case in the hands of their attorney, who obtained an injunction restraining the owner from selling or renting them. This he tried in vain to get removed by the Court, and at last repented, having found houses which he could neither rent nor sell not a very profitable investment. He has signed an affidavit to do whatever the Board may require, which will be to reconstruct the work, or so change it as to make it conform in all respects to the law.

### GENERAL.

**Plans by Mr. H. C. Charlewood,** architect, of Manchester, have been approved for the new church to be erected in Higher Chatham Street, Chorlton-upon-Medlock.

**Messrs. Cornish & Gaymer,** contractors, North Walsham, have undertaken the restoration of the nave roof of Deopham parish church, under the direction of Mr. Ewan Christian.

**The Death** of the landscape painter M. Alexandre Desgoffe is announced. He was a pupil of Ingres, and in 1868 executed decorative works in the Salle des Etudes de la Bibliothèque Nationale.

**Mr. E. Howarth,** curator of Weston Museum, Sheffield, has received on loan for the Museum, from the executors of the late Mr. Charles Brewster, of Retford, a large and valuable collection of pictures. The collection was opened to view on Thursday.

**The Paris Authorities** have appealed to the inhabitants to economise water, the absence of snow and rain last winter having told on the springs. The watering of the streets has been limited to twice a week.

**The Metropolitan Board of Works** have, with certain stipulations, granted permission for the construction of a subway from the Middle Temple to the Law Courts.

**The Bo'ness Town Trustees** have decided to close the Town Hall after the 31st, on account of the insecurity of the building through the existence of disused mine workings underneath, which have been causing subsidence for several months past.

**The Erection** of the new pier at Broadstairs has been stopped as a result of the proceedings lately taken by the Marquis of Conyngham, the owner of the foreshore.

**An Amateur Art Exhibition** was opened at Exeter on Tuesday by the Mayor, who observed that the extent and character of the Exhibition had greatly outstripped the expectations of the Committee.

**The Gaelic Society** have decided to present Professor Blackie with a testimonial in recognition of his services to the Highlanders. The testimonial will in all probability take the form of a portrait of the Professor.

**Glasgow Municipal Buildings.**—The authors of the design bearing the motto "Gauntlet," one of the four specially selected in the final competition of ten, are Messrs. Thos. Worthington and J. G. Elgood, 110 King St., Manchester.

**The Sanitary Institute of Great Britain** will hold its fifth autumnal Congress and Sanitary Exhibition at Newcastle-upon-Tyne, on September 26 to 30, under the presidency of Captain Douglas Galton, R.E., C.B., F.R.S. Among the vice-presidents are the Right Hon. the Earl of Durham, Right Hon. Lord Algernon Percy, Sir W. G. Armstrong, K.C.B., and others. Professor De Chaumont, M.D., F.R.S., has consented to give a lecture to the Congress.

**The Aberdeen Town Council** proposes applying to Parliament in the ensuing session for a City Improvement Bill.

**The Mills Building,** New York, has been wired for 5,588 Edison lamps. The conductors consist of 1,650 feet of Edison's patent electric tubes, 628 feet of lead pipe containing taped wires thoroughly insulated, 23,658 feet of zinc tubes, 75,909 feet of wire conductors, and 24,162 feet of wooded receptacles, placed between the doors, to hold the system of distributed wires. The total amount of wires used was 3,774 lbs., besides 48 vertical main cut-outs and 253 division cut-outs.

**An Installation** of fifty "Swan" Incandescent Electric Lights has just been completed at 279 Edgware Road, for Mr. Bowron, provision merchant, and a great saving is expected in the amount of the provisions spoiled by the heat of the gas, which is now dispensed with. The work has been carried out by Messrs. Edmundson & Co., of 19 Great George Street, Westminster, who are also engaged in fitting up these lights in several large country mansions, where a similar saving is expected, owing to absence of dirt and smoke which necessitates frequent painting and decoration.

**Two Stone Coffins,** apparently of very ancient date, have been discovered upon the northern side of Castle Church, Stafford. One of these is plain and the other sculptured, with a rude chevron and *fleur-de-lys*. The position of the coffins upon the northern side of the church, and the remarkable sculpture of the one, seems to indicate such unusual circumstances as would make them worthy of the notice of archaeologists.

**A Winter Exhibition,** for the purpose of developing the economic and general application of electricity for daily requirements, is proposed to be held at the Royal Aquarium, Westminster, from November 1 to March 1.

**A Carved Circular Pulpit** has just been completed and erected in Caldmore Church, Walsall. It is of Caen stone, with rich serpentine marble columns in front and coloured Irish marble column at the back. It is carried out in the early English style, and is from the works of Jones & Willis, Birmingham and London.

**The Committee** appointed to negotiate for the construction of a new church on the West Cliff, Whitby, held a meeting on Tuesday, the rector (Rev. Geo. Austen) in the chair. A letter was read from Sir George Elliot, Bart., M.P., in which, reverting to his promised subscription of site and 2,000*l.* towards the fund, he reminded the Committee that, in appointing Mr. Armfield as architect, they had forgotten the conditions attached to the gift, namely, that he should be consulted as to the appointment of architect. After some discussion it was agreed, with some expression of sorrow, to rescind the resolution referred to, and Mr. Johnson, of Newcastle, was unanimously appointed architect.

**London Water Companies.**—An analysis of the accounts of the Metropolitan Water Companies for the year ended December 31, 1880, compiled and arranged by Mr. Alfred Lass, has just been issued. It is that gentleman's intention to publish similar analyses of subsequent year's accounts, those now laid before the public referring to the transactions of the companies immediately subsequent to the inquiry into their undertakings by Sir William Harcourt's Committee.

**A Bust of the late Sir Charles Hastings,** by Mr. Brock, of Worcester, was presented to the city of Worcester on the occasion of the jubilee meeting of the British Medical Association just held there. Mr. G. W. Hastings, M.P., speaking on the occasion, said that Sir Charles Hastings, in his lectures, always advocated sanitary science, and impressed upon all the necessity of having pure water, well-ventilated houses, and clean streets. How he had grasped this great question had been shown by the advice given by the Social Science Association, in which he took a great interest. In sanitary science he did what he could to make its benefits known amongst the people; and the speech he then made, and which was published, showed how largely and deeply he had studied the question.

**Quantity Surveyors.**—The St. Pancras Board of Guardians having intimated that they would themselves appoint the quantity surveyors for the new workhouse buildings, the Workhouse Accommodation Committee met on the 8th inst., and after considering the qualifications and standing of the applicants (about twelve in number) selected the three following firms as fully entitled to the confidence of the Board, viz. Messrs. Maughan & Cuxson, Messrs. Sandall, Corderoy & Farthing, Messrs. Stoner & Sons; the votes obtained by each firm being 9, 8, and 7 respectively. The Committee's report was presented to the Board on the 10th inst., when Messrs. Sandall, Corderoy & Farthing were appointed. The total outlay contemplated is about 100,000*l.*, and the surveyors' charge allowed by the Board is 1½ per cent.—The Fulham Board of Guardians met on Thursday, the 10th inst., to consider applications received in answer to their advertisement for a surveyor to take out the quantities for the new Fulham Infirmary. The number of applicants was twenty-six; these were brought by ballot to two, viz. Messrs. Quilter & Hardcastle, and Messrs. Maughan & Cuxson. These were again put up, and each firm obtained five votes, when the chairman gave his casting-vote in favour of the former, who were appointed.

# The Architect.

## THE PHILOSOPHY OF ARCHITECTURAL SKETCHING.

NOTHING is without its philosophy ; and when our architectural students are just now pervading England, with Scotland and Ireland in some measure, and certainly the Continent of Europe in a very large measure, "filling," as the phrase goes, "their sketch-books," there is a sufficiently clear philosophy in their purpose and their work. It is not amusement, healthful recreation, or agreeable holiday occupation, and nothing more. Neither is it the covering of paper for the sake of a custom, nor even the collection of indispensable material for study and use. Amusement, recreation, and holiday occupation can be had in many ways with less trouble, less expense, and less strain upon faculties which are already in many cases a little overstrained. The accumulation of examples of design can be better done in the time at disposal by the purchase of photographs and books, or even by carrying on one's back one's own camera. But the real benefit to be derived from a sketching tour, if judiciously conducted as a course of instruction and exercise, is what cannot well be had by any other means.

There is a very old maxim which most people think they understand ; and so, superficially, they do—*Ex nihilo nihil fit*. Of course no thing can be made out of nothing ; the equation, *nil equal to nil*, is too clear to be disputed ; the man who has in his head emptiness brings out of it emptiness ; and so on the changes may be rung to any extent. But, in respect of such intellectual work as architectural design, it is peculiarly the fact that what has not been got into the designer's wits cannot be got out of them. The doctrine of intuitive genius is quite exploded. Genius of the best is but cultivated faculty, and faculty of the best is a felicitous but wholly adventitious organisation. When the man of genius is accustomed to regard his excellence as a thing he has to thank himself for—or perhaps his mother (it is clever women, they say, who have clever sons) ; his pride—and sometimes it is pride indeed—is after all no better, if no worse, than that of the man of riches who has inherited from others what he never could have made for himself. At any rate, genius or no genius, the expert designer of architectural and kindred art cannot produce a thing out of no thing, any more than a mathematician can, and, in other words, if he is to work at all with skill he must acquire that skill. What is more, his production, as has been often said, must be reproduction.

There is an appearance of paradox, no doubt, in this concluding phrase, but that is owing to the mere ambiguity of language. The real meaning of the proposition is that the designer, if he has not acquired specific material for design, or if he has not attained to the specific knack of using that material, fails to be able to design, by reason of want of knowledge, or want of skill, as the case may be. As a notable case, it is well known that a highly-cultivated Classic architect, who has never studied and practised Gothic, is actually quite unable, whatever may be his general ability and taste, to produce creditable Gothic work : we need scarcely add that our Gothic designers, forced by change of fashion to try Classic, are seen to have just as little success, even the best of them. Not only so, but there are no doubt men in City counting-houses and lawyers' offices who would have made the most admirable architects, if chance had not turned their attention in some other direction than towards the field where alone the requisite knowledge is to be picked up and the requisite skill to handle it. The work of design has otherwise been truly described as nothing more than the recombination of ideas or elements which have previously been laid up in the designer's mind ; laid up perhaps under very different conditions and in a very different shape, and often not recognisable in their recombination, but invariably *there*, because out of nothing comes but nothing. The cause and the effect, in fact, are mathematically equal.

The philosophy of the sketcher's labour, therefore, is that he is laying up ideas and learning how to handle them in

recombination. The process of sketching, indeed, if properly conducted, is the best possible means of acquiring both the material for use and the skill for using it. The more the student thoroughly sees and thoroughly understands—let us say "reads, marks, and inwardly digests"—the more he knows, in every sense of the word ; a full sketch-book is a full purse, therefore, and the quality of the contents is the quality of the coin. So also, the more he handles, the more he can handle ; practice, as the copybook used to tell us, makes perfect. The sketcher, therefore, by carefully delineating the subjects of his observation, carefully studies them ; analyses them, if perhaps unconsciously ; stows away in the recesses of subtle memory the essence of them ; acquires them as so much intellectual property ; accumulates for himself wealth of ideas and associations, to be employed hereafter as circumstances may happen to suggest. This is the acquisition of material for design by the best of all practical processes. At the same time, secondly, the sketcher is more and more "getting his hand in" for the twofold work of the recombining of those ideas and associations and (what is quite of equal importance) the handling of the instrument—draughtsmanship—whereby this act of recombination or design has to be performed. Much knowledge makes an easy fancy ; much drawing makes a facile hand ; sketching therefore makes both.

Now the fact is not at variance with this argument, but rather one to which it directly points, when we remember that there are architects of great academical knowledge who are the feeblest of designers, and others whose power of draughtsmanship is marvellous, but whose skill is not according to knowledge. A scholar may be a perfect cyclopædia of information, and yet have no more literary genius than his neighbour ; on the other hand, the poetaster may be of imagination all compact, while his knowledge of the world in which he flutters is on a level with that of the primrose by the river's brim of which he is so passionately fond. Nay, in plain language the case is even harder still : much knowledge may make the architect, not mad, but worse—stupid ; whilst much facility of drawing may make him, or rather another of his brethren, a mere sounding brass and tinkling cymbal. This cannot be helped ; there must be extremes in everything.

But, taking the ordinary well-trained, well-instructed, and well-intentioned architectural student, we cannot recommend to him any other educational process upon which he can so well rely as upon the practice of sketching for the double exercise of acquiring first—we say again, however unconsciously—a stock of material for the work of imaginative design ; and for attaining, secondly, by practice, the knack, not merely of handling the pencil, but of handling this material. What kind of subjects, then, shall he prefer to sketch ?

To this question no sufficiently clear and comprehensive answer can be given in few words. It is of no use in these scientific days to say he must throw the reins on the neck of his instinct and leave the choice to chance. At the same time it is impossible to lay down even the semblance of a hard and fast rule which all may follow. Inclination, no doubt, is very good evidence of aptitude ; although, in ardent youth, facility and ease are too often the fallacious guides of taste. Perhaps the best rule is to follow the lead of the best men, but, above all, to let palpable eccentricity go its own way. No one need desire to be before his age ; and the folly of a clever fool is almost more foolish than that of a dunce. The sketch-books of a fair average excursionist ought to be at any rate consecrated to quality rather than quantity. To confine attention to work which is really very good—let us say of the best—is more than we can propose. Architecture of the very highest order—supreme refinement in supreme repose—is not likely to be sufficiently in demand amongst the public of England for a long time to come. The picturesque has laid hold upon the land. And so be it ; picturesque architecture supplies a large field—and of course to a sketcher an especially delightful field—for study of a certainly satisfactory kind. At the same time, if the student can be persuaded to devote a share of his time to the less attractive and more refined examples of the non-picturesque, it may safely be said he will never regret it. When the fashion was to measure and delineate with scrupulous precision the graceful mouldings and delicate ornament of ancient Greece, the effect of the mere exercise upon the mind was acknowledged to be in every way exquisite ; and to the students of another nation than our own it is so still. We cannot be wrong, therefore, in recommending our young men, especially in their Continental rambles, to

take in hand, when opportunity offers, if only for a change, some of the very refined modern work of the best French, Belgian, Italian, and German schools. It is difficult to make "a good sketch" of such work, no doubt; but all the better for the sketcher; a tumble-down alehouse in a rustic hamlet is very much easier, but it does the sketcher, not only as much harm as good, but sometimes more harm, as an architectural designer, than he is ever aware of till it is too late.

The best *architectural* subjects, at any rate, ought to be the rule, as distinguished from things more fascinating but non-architectural. The object of the architectural designer is to lay up architectural examples and to acquire architectural skill.

### AUTUN.

BY A CORRESPONDENT.

THE traveller who finds himself at Nevers, under the pleasant necessity of making his way from central France towards her eastern boundaries, should by all means spare a day or two to leave the iron way and turn aside into the carriage-roads through the forests of the Morvan. Issuing from that delightful region for all lovers of wild woodland, streams, and ever various change of mountain and valley—be they wayfarers on foot, horseback, or four wheels—he will, or may, by the picturesque ravine of the Canche drop down past La Selle into a well-watered plain, encircled on all sides by mountains of no great height, but of fine outline. To the south-west rise the heights of Morvan, with the Mont Beuvray conspicuous, site of ancient Bibracte of Gallo-Roman times; in face, on the eastern side of the curving plain, slope up, with more abrupt spring at every higher terrace, hills richly wooded, cleft by deep ravines, an umbrageous and deeply-tinted background for the city, only younger than Bibracte, successor to its power, *Augustodunum* of the Romans, Autun of modern France. Built on the side of the hill, surrounded by its ancient walls, enclosed again by walls and towers of mediæval date, and crowned at its highest point by the grey cathedral of Saint Lazare, the town of Autun is an impressive end to a day's journey—a worthy reward for a *détour* from the beaten track.

This little city, once famous and powerful, is now a station on one of the loop lines off the main railway of the Paris and Lyons route; but before railways were it was a chief resting-place on a post-road from Lyons which ran this way and right on through the Morvan, the Roman road of AGRIPPA, of which the traces yet remain. So late as last year diligences yet traversed this road, but it was said to be their last season. Two of the grand Roman gateways yet are standing—*Porta Senonica*, or the gate of Sens for Paris, now called *Porte d'Arroux*; and *Porta Lingonensis*, or the Gate of Langres, now called *Porte St. André*. With their massive uncemented masonry, and grand, stately proportions, arcaded in double storeys, even in ruin these gates are most imposing. The *Porte St. André* was partially restored in 1847 by VIOLETTÉ-LE-DUC; it is, perhaps, the finer monument of the two, built in the Ionic order, with sculptured frieze and medallions, and arcading of varied proportion, and having projecting wings or towers which give shadow. These fortified gateways were supplemented by a system of earth-works and solid outposts, of which last one remains, and is popularly called the Temple of JANUS. It is a solid shell of masonry, broken within by arcades and niches below, with window apertures above; it stands now amid the meadow grass and clear streams, grand in its massive simplicity, and helps to increase in the landscape surrounding of Autun those reminiscences of Roman Italy which the curving plain and circling mountain line, and something in the colour too, constantly bring up. Two sides of Autun the Roman wall rears its massive bastions, now shaded by avenues of lime and chestnut planted beneath. As the town lies on the slope, the wall takes the slope also, and stalks up and down hill, setting its round towers at regular intervals, and affording an ancient massive substructure for many an incongruous construction of to-day. Garden terraces are planted on the top, cellars and storehouses scooped out of the thickness of the wall, or flights of steps managed by adjustment of the outer course. In one place a mediæval tower has been built on the ruins of the Roman tower, and this again is surmounted by an addition of the present century, coved roof, and conspicuous Madonna—sign of the pious Ursulines, who

now hold the old tower within conventual enclosure. Within these venerable defences, gardens, streets, miscellaneous buildings, fill up the space on the lower slopes up to the inner circle of the mediæval wall which marks how the city had shrunk in compass since its Roman renown. FRANCIS I., after Autun had suffered by the fortunes of war—fire, siege, and pillage, over and over again—united within the same wall two separate portions of the town, thereby leaving outside the enclosure some of the great abbeys, as can be still traced by their ruins. The wall which FRANCIS I. joined, so to speak, makes one of the most picturesque features of the place: erections of various dates, with more or less quaint constructions of deep and overhanging roofs, round towers and square towers with conical tops, projecting balconies, dormer windows and long staircase lights, break up the winding wall; gardens and orchards muffle round the feet, and the town mounts up within, up to the Cathedral of St. Lazare.

St. Lazare is not a strikingly beautiful edifice, but it is interesting and rather imposing. It was built in the twelfth century, pulled about in the fifteenth, and furnished with a very elegant stone *flèche* by Cardinal ROLIN. The interior presents that curious conjunction of Classic treatment and Gothic form which marks the Romanesque transition in parts of Central France. Fluted pilasters, Romanesque capitals, square piers, are found with pointed arches and vaulting. For the rest, the interior, though lofty and massive, is not pleasing; by far the most striking feature of the church is the great western open porch, which covers a space wide as the nave and the two aisles, and is approached by double flights of steps. The tympanum over the centre door is filled by a curious sculpture of *The Last Judgment*, in the archaic energetic style of the sculpture at Vézelay, but more grotesque. There is a curious story told about this piece of sculpture. During the "Reign of Reason" VOLTAIRE came down to visit Prince TALLEYRAND, Bishop of Autun, and of course he inspected the cathedral, where, seeing this sign of a devout age long past, he remonstrated, and pointed out that the enlightened people of Autun would do well to cover up anything so foolish, barbarous, and ugly as this archaic *Last Judgment* with a good smooth plaster coat. He being so great a man, his advice was taken; and when the worshippers of Reason had come to the pass of breaking up the imagery of the Catholic cult, the sculpture of Autun, safe beneath its plaster, escaped injury. Within the last thirty years a stranger knowing in the arts was struck by the anomaly of this plain tympanum in such a great cathedral, and observed, moreover, a peculiar inequality of surface, which indicated something beneath. So he got up a ladder and began chipping, and having very soon found that there was something beneath, he wrote to Paris for permission to meddle with this registered "ancient monument," and, permission obtained, chipped in good earnest, until out came the *Last Judgment* in perfect preservation, kept safe through troublous times, thanks to anti-Christian VOLTAIRE! They took casts of it and of the fine figures and devices on the door-lintels, last year, for deposit in the new retrospective museum of casts at the Trocadéro. Another curious occurrence that befell recently at this church happened only the other day, when, by a fine feat of engineering, they removed the supporting piers of the central tower, lifted the stone *flèche* bodily in the air, replaced the piers with more reliable courses, and set down the spire again! That was a kind of thing the good people of Autun would appreciate, a piece of practical nineteenth-century audacity and invention. As regards care for "ancient monuments," they are most decidedly in opposition to anything of the kind; and it is only by dint of great pertinacity that the few savants and art-loving gentry of Autun can hinder the constant demolition of the remaining traces of Mediæval or Renaissance domestic architecture here and there left in the town. To make a short cut for business traffic, your citizen of Autun would break up the tombs of his forefathers and mix their venerable ashes with the mortar for a new wall. Not that any commercial activity of Autun justifies such utilitarian views. The town is out of the main routes; it has no special industrial developments of any importance; it is a respectable, moderately thriving, cathedral town, owing its importance chiefly to its episcopal dignity, and to the large seminaries for the instruction of Catholic youth which occupy a great portion of the habitable area. Such establishments are in accord with the most conservative repose, and it would be well that Autun should preserve itself in peace, if the picturesque charm of the place is to last. Its history is

a history of the past. Among the treasures of the museum in the Hotel de Ville, and much more in the *Musée Lapidaire* of St. Nicolas, and in the walls and towers of the little town, its own history is told in a sequence that whoso studies may read. The very soil is full still of records in stone; the spade of the peasant and the navy becomes at any moment the tool of the excavator; and there is a sense in which one seems nearer to the time when the Roman eagle passed under the gates of *Augustodunum* than to the reign of the bold Dukes of Burgundy, or to the later days of that siege of 1591, when the inhabitants of Autun, even the women, fought rather than submit to the generals of HENRI QUATRE. There is, indeed, very little of the Renaissance left in Autun. The exquisite little fountains of St. Lazare, in the cathedral *place*, stands almost alone, and even that is shorn of its second dome, surmounted by a pelican, which is now in the St. Nicolas museum.

We have not time to take the reader out of the town up the steep ways through the woods to Montjeu, seat of the family TALLEYRAND-PERIGORD, from the terraced parterres of whose château is one of the finest and most romantic views to be seen hereabout; or to plunge into the umbrageous ravines where the waters from the pure and exhaustless pools *de la Toison* and *de Paillard* come dashing down in joyful and noisy cascades. Nor can we turn aside to wander on the turf underneath the splendid Spanish chestnuts that sweep the ground with their great branches on the western slope of the hill behind the town or look out to see the cloud shadows flit over the plain, and rest lovingly about the crest of old Beuvray; or follow up the shining streams among the eastern hills, past many a quiet village with its château and old church, to pretty Lucenay l'Évêque, where of old the Bishop of Autun must always sleep one night before he entered the city to be consecrated. These and other pleasant things must go untold now, and we must leave but half related the attractions of Autun.

### THE STUDY OF ANCIENT BUILDINGS.\*

THE present age is distinguished by a tendency towards combination and union of effort in every department of human activity, whether commercial, literary, scientific, or ecclesiastical. In commerce limited liability companies are the order of the day. Science holds its periodical symposia in the great centres of our population, where observations are compared, and the most recent theories brought to the test of investigation and argument; and ecclesiastical affairs excite an interest never before witnessed, and create discussions not always of the most harmonious character. Archaeology has partaken of the same impulse, and has not been backward in the career of progress. The venerable parent Society of Antiquaries still pursues its quiet, useful course, undisturbed by the more excursive character of its offspring. The two metropolitan societies, the Association and the Institute, have for many years carried on a friendly rivalry in the investigation of our national antiquities, for which the increased facilities of travel in these modern days offer unexampled opportunities. In addition to these, there is not a county or a considerable town in the kingdom which has not its local society devoted to the same object. It might be thought from the number of these agencies at work, and the amount of interest taken in the study, that the subject had become pretty nearly exhausted, and that little room was left for further investigation; but it is not so. The inquiry extends over a vast field; the objects are numerous, and many of them, perhaps the most interesting, are either difficult of access, or not obvious, and require to be brought under notice by skilled experts who have made them a lifelong study. It may be asked, What is there in the investigation of ancient buildings—many of them in a state of hopeless ruin, or in heaps of rough stones, apparently meaningless, or in grass-grown mounds of earth now furrowed by the plough—to excite such an amount of fervour and enthusiasm? Our interests are all in the present and future—

Act, act in the living present . . .  
Let the dead past bury its dead.

This would indeed be a short-sighted and frigid philosophy, and would unsettle some of the noblest associations and impulses of which the human mind is capable. The present is only secure when it is well anchored in the past. The continuity of our institutions is the one great cause of their stability. The why and the wherefore of the present can only be ascertained by reference to the past. The motives, the feelings, the principles, and the prejudices of our own times are inherited from our fathers, and we, in turn, will have to hand them down, improved and elevated let us hope, to our successors. The law of mental association is a very important

factor in our habits of thought, and dictates a large portion of our ordinary course of life. If these associations connect us with what is noble and elevating in the past, they are surely worth entertaining and cherishing. The words of Dr. Johnson, when musing amidst the ruins of Iona, have often been quoted, but have lost none of their force, during the century which has since elapsed. He says:—"To abstract the mind from all local emotion would be impossible if it were endeavoured, and would be foolish if it were possible. Whatever withdraws us from the power of our senses, whatever makes the past, the distant, or the future predominate over the present, advances us in the dignity of thinking beings. . . . That man is little to be envied whose patriotism would not gain force upon the Plain of Marathon, or whose piety would not grow warmer among the ruins of Iona."

We have in the history of England a glorious inheritance. It is a wonderful story of development and progress—from darkness to light, from slavery to freedom, from ignorance to knowledge, from short-sighted folly to long-sighted wisdom—until it has become—

A land of settled government,  
A land of just and old renown,  
Where Freedom broadens slowly down  
From precedent to precedent.

We are justly proud of our English institutions, with their roots firmly fixed in the past, and their vigorous branches stretching forward into the unknown future; but history does not consist entirely of written documents, however valuable their contents may be. The surface of our country is studded with historical records written in stone, and brick, and earthworks, which bridge over the period between the ages before the dawn of written history, and connect them, without a break, with the living present. Written history without these—however eloquent—would be comparatively tame, spiritless, and uninteresting. What written history speaks more graphically or spans more completely the whole course of British events than the Tower of London, whether its origin be British, Roman, Saxon, or Norman? What reality it gives to the varied events which have taken place within its walls! How, in passing along its gloomy corridors, we seem to feel the presence of the illustrious departed! The memories of Sir Thomas More, Queen Anne Boleyn, Lady Jane Grey, Raleigh, Sidney, Russell, and a host of other worthies, seem to hover in the air, and bring to our senses memories of the past which no merely written documents could do. Or take Westminster Hall, with its feasts and coronations, and State trials of five hundred years ago; or the Abbey, with its stately architecture and its unparalleled series of national monuments. Imagine these swept away, and from whence could the loss be supplied? I mention these as being metropolitan and well known, but there are thousands of objects all over our country which have special associations with the past, or at all events form links in the chain which binds the remotest ages with the present. Going further back, the Roman remains—additional specimens of which are from time to time disinterred—give evidence supplementary to written history, which on this subject is very sparse; of a degree of cultivation, refinement, and general prosperity, which must have prevailed during several centuries, but of which no records are extant. The mining operations of the Romans, of which such extensive *débris* remain, the splendid roads which traversed the country in all directions, many of which are still in use; the great wall and stations of Hadrian, all manifest the application of engineering skill and capital, which could only have existed under a settled and wisely-administered Government. Further back still we come to the twilight of English history, which is ultimately lost in darkness. Here written evidence fails us, but we are not without a clue to guide us through the labyrinth to certain definite conclusions. The cromlechs, the stone circles, the dolmens, the barrows, the grave mounds, the pit dwellings, the primitive fortifications, supply in themselves no certain indications of the date of their construction, but they afford very strong evidence of the state of society, the manners and habits of those who erected them. Further back still, we are introduced into the habitations of the cave-dwellers, where man struggled for supremacy with the cave lion and the bear, and used the primitive weapons of bone and flint for the capture of the fish and deer on which he subsisted. Again we go back until we reach the drift period, where we have the earliest intimation of human life in its incipient stage of feeble progression. Now, reasoning from analogy and comparison, we are able to draw certain conclusions from what we find, and present with tolerable accuracy a picture of the forefathers of our race in their earliest development. These earlier stages belong more properly to what is called Palæontology, but it is difficult to draw the line where Archæology ends and Palæontology begins. As investigation goes forward the two will, of necessity, blend together and form a single department of inquiry. I think a very cursory glance will show that there is ample scope and verge enough for a union of effort devoted to one common end, the examination and elucidation of our relics of antiquity of all ages and of every description. This is the origin and the *raison-d'être* of the existence of the British Archæological Association, and the fruits of its labours are to be found in the thirty-eight volumes of its Transactions

\* Presidential address delivered by Sir James Picton at the meeting of the British Archæological Association on Monday evening.

I wish now to say a few words on the objects it has in view and the means of carrying them out. Its main purpose is to call attention to the precious relics of antiquity which remain amongst us, to facilitate their inspection and examination, to inquire into and illustrate their history where practicable, or otherwise to deduce from their own internal evidence the conclusions to which they lead; to encourage an intelligent study of our antiquities and of the art and science displayed in their construction; to place on record the results of the annual meetings and visits in the various localities; and last, but not least, to engage public sympathy in the guardianship and preservation from injury of these precious remains. Here is a wide field, in which all who take an interest in the objects of the Association may find a sphere of usefulness. I will just allude to the last—the preservation from injury, or, it may be, effacement. Many valuable objects, especially of the prehistoric character, have been, and still are, consigned to destruction through simple ignorance of their value. I will give one instance in which interference of the kind I have mentioned proved successful. One of the finest Danish monuments in the kingdom, the Great Stone of Thor, at Thurstanton, in Cheshire, was recently doomed to destruction, the monument to be destroyed and the land enclosed and built over. Public attention was called to the subject by a member of this Association, and the ultimate result has been that the stone has been preserved, and a reserve of forty-five acres round it has been dedicated to the public as a recreation-ground. Much may be done by keeping the public alive to the importance of preserving our national monuments. There is on the whole a desire to do what is right and proper in the matter. All that is wanted is to enlighten the public mind, and to point out in what the interest consists.

This leads to another vexed question, which has raised considerable discussion, not unfrequently conducted with unnecessary warmth, and even violence. I mean the so-called restoration of our ancient buildings, especially churches. The revival of mediæval architecture within the last fifty years, concurrently with what is called the Oxford ecclesiastical movement, drew attention, especially amongst the clergy, to the neglected and dilapidated state of our churches in some instances, and in others to their degradation and disfigurement by the interpolation of galleries, box pews, and rebuildings in an altogether unworthy style. Considerable zeal was manifested in improving this state of things by removing the excrescences and endeavouring to restore the buildings to their original condition. Zeal, however, is not always accompanied by sufficient knowledge and wisdom, and hence it has too frequently happened that the restoration has resulted in an error of the opposite kind, and in the attempt to reproduce a specimen of pure mediæval architecture, all the flavour of antiquity has been done away, and the residuum has become a raw, cold, staring building, reminding us rather of the modern contractor than of the hoary freemason of old. Sentiment has much to do with our appreciation of antiquity. We like to feel that these are the very chisel strokes of the ancient mason, that these are the *ipsissima saxa* which he laid. Here is the mason's mark cut with his own hand. There are the tiles worn into depressions by the pacing of the priest to and from the altar. Father Time comes with gentle hand, and tints the surface with weather stains, and here and there chips off a corner or rounds an angle; but he imparts a mellowness and flavour which give a wonderful charm, and carry us back through the distant ages, when we can realise in imagination the original state of the work. Then comes the half-informed restorer, clergyman, probably, fresh from the Ecclesiological Society, full of his notions about parvies, and rood lofts, and credence tables, and sedilia. Down go the pews and galleries, which none will regret. New tracery is put in the windows; the walls are scraped and chiselled until the ancient surface is all gone. Minton's tiles are laid down in the chancel, and a wonderfully sculptured reredos is placed above the altar table. He contemplates his work of destruction with smiling complacency, while the grieved antiquary can but sigh like the Jews when they saw the second temple and compared it with the first.

Matters of this kind have been bad enough in England, but they have been still worse on the Continent. It is pitiable to see the fine old Romanesque churches in Cologne, fraught with the hoary antiquity of a thousand years, mellowed and tinted by time, now scraped, chiselled, and pointed up to such a degree that they look as if the builder had just received a certificate for the payment of his last instalment. Much mischief has been done, but there are still many fine buildings which have hitherto escaped the ravages of the restorer. It is to be hoped that all who have a true reverence for antiquity will lend their aid to prevent all needless desecration.

The true principle of restoration is this—Where an unsightly excrescence has been introduced, remove it. Where a stone is decayed, replace it. Where the walls are covered with whitewash, clean them down. If tracery is broken match it with new of similar character, but spare the antique surface. Do not touch the evidence which time has recorded of the days gone by. I say nothing of buildings in ruins, or in danger, which of course must be rebuilt in the style best suited to the purpose.

Not the least pleasing feature in these annual gatherings is the

social intercourse thus promoted and encouraged. The association and mingling of like-minded persons having a pursuit in common is always agreeable, but this is greatly enhanced when the object in view is one which recommends itself by its connection with our historical studies, our patriotic feelings, our love of Nature, our pursuit of knowledge. We here renew our friendships, compare notes, report progress, and if in this ever-changing scene some are removed, others succeed to fill their places; and thus the flame is kept alive by the torch being handed on from generation to generation. Not the least pleasing feature is the presence of the fair sex, who add a charm and give a zest to our proceedings; and whose intelligent appreciation of the value of our antiquities may lend important aid towards their preservation. The history of the proceedings of this Association, as exhibited in its published volumes, is fraught with interest. My connection with it is not of very long standing, but I recall with pleasure those meetings which I have been privileged to attend. Last year we visited Worcestershire, under the presidency of the Rev. Lord Alwyn Compton, who gave us a most hospitable reception, and who conducted us with natural pride over the grand cathedral which now dominates over the Severn in all its pristine magnificence. Unfortunately, the heavens did not smile upon us in the manner to which we have been accustomed, and many of our excursions resembled explorations after the deluge. However, mutual sympathy and forbearance kept us alive, and a very enjoyable week was spent in spite of the weather. One great advantage and source of enjoyment in these annual meetings is the facilities which are offered for visiting places not usually open to the public, and the discovery of others little known or difficult of access, and it must be said that almost universally the utmost courtesy is shown and every opportunity given for the explorations of the visitors. Honourable mention especially is due to the clergy for the intelligent information furnished respecting their churches, and to their families for the kindness with which we have been uniformly welcomed. In 1880 we made Devizes our headquarters, and explored the wonderful archaeological remains of Wiltshire under the auspices of Earl Nelson, of whom it is only bare justice to say that he was one of the best presidents that ever conducted the business of the Association. In 1879 Yarmouth, under the presidency of Lord Waveney, was our centre, from whence we radiated in all directions amongst scenes of the highest archaeological interest. Every county has its own peculiarities and special objects of attraction. Whilst Wiltshire is peculiarly rich in prehistoric antiquities, such as Stonehenge, Avebury, &c., Norfolk and Suffolk stand pre-eminent for their beautiful and grand mediæval churches, which throw considerable light on some historical questions. In 1878 the Fen country was the scene of our operations, Wisbeach being the centre, and the Earl of Hardwicke our President. Here the scenery and the associations were of an entirely different character. The grand embankments of the Romans, and the mediæval history of the small seaports, carried back our inquiries into several successive phases of our national life. I need not expatiate on these. Are they not written in the Book of the Chronicles of our Association? Farther back than these I cannot personally go. The previous meetings are to me prehistoric and mythical, but

Vixere fortes ante Agamemnona multi.

I have no doubt the silver trumpet of our worthy secretary sounded in tones quite as inspiring, and that the meetings were quite as genial and interesting, as those with which I have had the honour of being connected.

And now, before I close, let me say a few words in anticipation of the events of the coming week. We have a varied programme before us, calculated to excite high expectations. As in a feast of another kind there can be no harm in conning the *menu* before the banquet is served. The West of England is not excelled in interest by any other quarter of the United Kingdom. It was for long the battle-ground between the retiring Celts and the advancing Saxons, and its subsequent history is connected with many striking and important events. Devonshire ranks second in size of the counties of England, and yields to none in fruitfulness and beauty. Its undulating surface, its deep combs and winding valleys, its rural lanes, fringed with luxuriant hedges glowing with the richest colours, present peculiar features, unequalled of their kind elsewhere. The tribe of the Damnonii, in whose occupation we find it in the earliest notices of history, were probably allied to the Belgæ, who were located to the eastward. They were probably not the aboriginal inhabitants, whose relics are found in the caves, but an immigration from the opposite coast of Gaul. We trace their memory to a limited extent in the names of most of the rivers—the Avon, the Exe, the Teign, the Taw, the Tamar, the Plym, &c.—and in a few place names, as Clovelly, Ilfracombe, and in the tors which dot the country. It is rather a singular fact, arising out of the circumstances of the history, that east of the Tamar Celtic names are sparse and few; west of that river they predominate to a large extent. Under the Roman dominion we know there were important stations in several parts of the county. Isea Damniorum, now Exeter, was a provincial capital from which radiated high roads in every direction. Such place names as Ilchester, Exeter, Stratton, bear unmistakable marks of Roman occupation. The submission of the Damnonii to Roman sway, compared with the sturdy resistance of the Cornwealtras or Cornubii, rendered the

district an easy conquest for the West Saxons under Cerdic, about the beginning of the sixth century. That the Saxon settlement was thorough and complete is evident from the almost entire prevalence of Saxon names in the towns and villages. The ninth century witnessed continual ravages of the south coast by the Danes or Northmen, but their permanent settlements were not extensive. Such names as Tot-ness, Hope-ness, Start Point, and Hoe indicate their presence. In the subsequent history of our country the men of Devon have always acted a prominent part. Some of our most distinguished naval heroes were natives of Devon, such as Sir Francis Drake, Sir John Hawkins, Sir Walter Raleigh; and Blake, though born just outside the county, was closely connected with it. The number of harbours at the mouths of the rivers along the coast of Devon encouraged the early devotion of the inhabitants to fishing and commerce, which was a very important factor in the early history of England. The noble, and almost unequalled, harbour of Plymouth early marked it out as a naval station; and since its incorporation in 1438 it has gradually grown up to its present importance as a dock and building-yard for the Royal Navy. We are promised what, I am sure, will be very interesting papers on "The Antiquity and Antiquities of Plymouth" and on "The Plymouth Municipal Records." Another paper on "Old Plymouth China" and on the county seals. On pre-historic subjects we are to have an article on "The Horlers, Trevethystone, and Duloe Stone Circle;" another on "A Group of Pre-historic Remains on Dartmoor." On mediæval architecture we shall have papers on the peculiarities of the churches of Devonshire, and on Plympton Castle and churches. Connected with biography we shall have notices of Admiral Robert Blake, and of the family seat of the Raleighs; and on mediæval manners and customs are promised a paper on municipal life in the olden time. What shall I say of the daily excursions by rail and carriage and steamer? Should the weather prove propitious, they will be charming and delightful, exhilarating and inspiring, feasting the eyes and informing the mind; and even should Jupiter Pluvius empty his cisterns somewhat in excess, we will endeavour to bear the infliction with equanimity and resignation. If we each endeavour to do our part by cheerfulness, good temper, and mutual assistance, always obedient to the summons of the silver trumpet, and following the directions of our leaders, we shall find that the ways of the Association will be ways of pleasantness, and all its paths will be paths of peace and delight.

#### PLYMOUTH MUNICIPAL RECORDS.\*

I CAN hardly imagine that any town in the further West of England can have possessed a more valuable series of records than Plymouth. The very importance of Plymouth, and the prominent part it has played, has been one of the chief causes of the disappearance of records that would be now almost invaluable. We cannot tell when Plymouth first became a borough. It was formally incorporated, as we now know it, by Act of Parliament 18th Henry VI. (1439-40); and from that date to the present day records of various kinds are extant. But there was a corporation, in part at least, of the town, long before that. The bailiffs and commonalty wrote to the King, May 31, 1289, concerning the preparation of a ship for his service. Richard the Tanner was Prepositus of Sutton (the elder name of Plymouth) in 1310; the seal of the commonalty of "Svttion syver Plymmvuth" occurs upon an extant deed of 1368; and whether as headmen, mayors, or portreeves, the names of about a score of chief burgesses of the town prior to the Act Charter have been recovered from casual mention in deeds and the like, though not an original municipal record of this date exists, and the oldest document in the possession of the corporation is a conveyance of a messuage in Old Town, dated 1381. Whatever the origin of the municipality of Plymouth, the Crown had nothing to do with it until the incorporation of 1439-40. Edward II. proposed in 1319 to make it a free borough, but was resisted by the lords—the Prior of Plympton as owner of Sutton Prior, and the Valletorts as the owners of Sutton Vawter—and more than a century and a half elapsed before the town of Sutton Prior, the hamlet of Sutton Vawter, and the tithing of Sutton Raf were incorporated as the borough of Plymouth. At the date of that incorporation there must have been a body of municipal and other records of some importance, for there were various guilds also in existence—a Guild Merchant, the Guild of our Lady and St. George, and the Guild of Corpus Christi at least—but not one original paper or parchment remains, and only a few copies.

We are in much the same position with regard to the earlier records of the present Corporation. There is hardly an original document extant dating before 1486. In this year, however, commence the accounts of the Receivers of the Borough, which are practically complete from that period to the present time. Had I written this paper two years ago I should have had to lament the existence of a gap between 1570 and 1658; but in January 1881 there was found among the muniments of the Morshead family at

Widey Court, near Plymouth, a tattered volume, which on being shown to me was at once recognised as the "missing link." There is no evidence that it had been in the possession of the Corporation since the middle of the last century, but directly its identity was pointed out it was restored.

There are some other accounts of the end of the fifteenth century, chiefly relating to works connected with the Church of St. Andrew; but the most valuable records of this period are to be found in an old book, which someone seems to have kept as a kind of commonplace or day book for the entry of miscellaneous matters. This contains notices of the proceedings of Manor Courts, of the Borough and Pie Powder Courts, of inquests by Simon Carswell, coroner (whom I suspect to have been the writer), copies of various deeds, some of considerable interest and value; the earliest borough rental, commencing 6th Henry VII., precepts and warrants concerning the water of Sutton Pool, a very curious abstract in English of the Charter of Henry VI., and a copy of the earliest noted bylaws. Some of the entries in this book are as early as 38th Henry VI., and it contains the oldest series of contemporary records now in the possession of the Corporation.

Next in point of date to the books already mentioned, but first in importance, is the ancient "Town Ligger," a bulky volume in oak boards and tattered pigskin, long known by the name of the "Black Book." This is probably the new "lygger," for which, and writing therein all that was in the old, 20s. was paid in 1535-36. It commences "Jesus Christus. Liber maioris et Communitalis burgi de Plymouthe in Com. Devon." The earliest current entries refer to the year 1540, but it contains copies of the charters, and of a number of ancient documents of importance relating to the town, for which in most cases it is now the sole authority. The "Black Book" was evidently intended to be a repository of all matters of note relating to the commonalty—proclamations, bylaws, Acts of Parliament, guild orders, assessments, with lists of mayors and freemen, while eventually it came to be used also as a registry, in which deeds relating to private properties in the town were enrolled by the town clerk—no doubt duly fee'd—for safe keeping. All communications from the King or Court were not only to be entered "for the good gyding of the Towne," but every article in the "lygger" was to be read once a quarter or twice a year in the hall "for the good remembrance and good rule of the same to be hadde"—an order which it is impossible can ever have been literally obeyed. A very important feature of the "Black Book" is the fact that it became the custom to enter under each mayoralty brief memoranda of leading local and national events. The book continued to be used as a record of the mayoralties down to 1709, and its lists of freemen are continued to 1658. Without it much of the early history of Plymouth would be a complete blank, and one of its entries supplies the first clue to the disappearance of the older records. It notes that Plymouth had been burnt three times (by the French and Bretons) in 1377, 1400, and 1403; and under the mayoralty of Richard Hooper, 1548-9, it states that the town was assailed by the Western rebels for the restoration of Catholicism—"then was our stepell burnt with all the townes evydence in the same by Rebelles." All that seems to have been then preserved, with the exception of a few scattered documents, were the books in current use.

Next in importance to the "Black Book" is the "White Book"—a volume given to the town by John Ford, mayor in 1555, and used from 1560 down to 1754 for the entry of bylaws and orders of the "twelve and twenty-four"—the familiar names of the aldermen and councillors—and of the sessions. These orders are for the most part signed by those who made them. There are a number of letters from the Privy Council and various persons of note of the reign of Elizabeth still extant; but only a very small proportion of these which we know to have existed; and the number of important documents of this period that have disappeared must be very large.

I have so far said nothing about the charters. The oldest now in the possession of the Corporation is that of Mary (1st year), which is gorgeously if not handsomely illuminated. There are also charters of Elizabeth (43rd), James I. (12th), Charles I. (3rd), Charles II. (19th and 36th), and William III., the present governing charter of the town. Of the charters before Mary—those of Henry VI., Richard III., and Edward IV.—there are only copies. The originals probably perished either when the "stepell" was burnt by the rebels, or fell victims to the malice of a Totnes man who came down to Plymouth in 1601-2 and burnt a record chest in the Council chamber. The present charter chest dates from about this period. Here is the entry from the Receiver's accounts:—

Itm rec. of Nicholas Goodridge of Totnes mrchaunte vpon an agreement made between the Towne and him for an offence comitted by him the said Nicholas in burning of a cheste in the Councill Chamber wherein were containyd divers evidences and writings concerninge the Towne. Cld.

It is probably to this severely-punished piece of arson (the fine would be equivalent to nearly 600% now) that one William Jennens and John Warren, in the course of a suit with the Corporation, referred when they declared, about 1665, that the town records had been burnt some seventy years previously. From the early part

\* From a paper read by Mr. R. N. Worth at the meeting of the British Archaeological Association.

of the seventeenth century the various sets of current Corporation books are fairly complete, and there are a few of what may be termed the day-books, which it was the custom to destroy, with the vouchers generally, when they had been produced and examined at the annual audit. The most interesting volume of seventeenth century accounts is one which belonged to the Committee of Defence at the time of the siege of Plymouth by the Royalist party, containing a full statement of their expenditure from February 1644-5, January 1645-6 (the siege itself lasted with intervals over three years). Among other documents that may be noted are the original warrants for the "regulation" of the Corporation in 1662, and the entry in one of the books of the Borough Court of "all those who came into open Court," June 4, 1660, at the Restoration of Charles II., and declared "their humble acceptance of His Majesty's Gracious pardon." Very few of them, however, were able to satisfy the Commissioners of Regulation. The papers of the Borough Court, which came to an end in 1842, date back to the reign of Henry VII., but there are only a few of the older ones left. The Court Books now extant commence in 1636, and some of the volumes contain most quaint illustrations of the manners and customs of old Plymouth. There are some very curious entries respecting the style in which "conventicles" and their frequenters were dealt with under the second Charles and James. Among miscellaneous papers, as an illustration of the valuable bits of history that may turn up in odd and "scrappy" ways, I may mention that one found contains the name of Theodore Palæologus as resident in Old Town Ward, and assessed to the poor in a halfpenny per month. This "last descendant of the Greek Emperors of Constantinople" lies in Landulph Church. How he came to be buried there has never been clearly made out. It is one step towards the solution of the mystery, now that it is for the first time made public that he was a resident in Plymouth, and, to judge by the amount of his assessment, in comparatively humble circumstances.

### BUILDING MATERIALS COLLECTION.

**L**AST year a committee was appointed to examine the Structural Collection at South Kensington and report whether it should be maintained; and if so, in what direction it should be developed, and what specimens might with advantage be removed. The late Mr. G. E. Street, R.A., with Mr. Gregory, Mr. Abernethy, and Major Seddon, composed the committee.

In the report just published, the committee say:—We believe that the establishment of this collection has been of great value in many respects. As a notable instance of its results, we may refer to the improvement of terra-cotta for structural purposes; so far back as the year 1867, at the International Exhibition, Paris, the result of this development was such as to place English terra-cotta in the highest rank, thus giving to the architect and the builder a material whose plastic character before burning admitted of mouldings and enrichments being produced and multiplied at very small cost, while the improvements in the process of burning turned out these mouldings and enrichments not only harder than stone, but unchanged in form, and in true lines.

Other illustrations are to be found in the improvement of mosaic work of various sorts, in the enlarged application of ornamental tiles for different purposes, and in the use of earthenware, plain and coloured, for walls, ceilings, pillars, mouldings, and architectural enrichments, of all of which examples of great beauty are seen in various parts of the South Kensington Museum.

Referring to the more general uses of the structural collection, it may be considered a natural and necessary adjunct to the science classes of the Science and Art Department, more particularly to those which deal with building construction and the elements of architecture; and such a museum is of undoubted value for normal schools for training teachers, in so far as it enables them to make themselves acquainted with all the latest appliances as well as with the best and cheapest materials and forms of construction. Even without a direct connection with educational establishments, such a collection is of great value for general reference, while the exhibition of foreign building materials and foreign structural models ought to enlarge the views and improve the practice of our own manufacturers and workmen.

We are enabled to state, on the authority of Sir Frederick Bramwell, F.R.S., Chairman of the Executive Committee of the City and Guilds of London Institute for Technical Education, that in selecting South Kensington as the site of their central Institution, they were greatly influenced by the neighbourhood of the South Kensington collections. Sir Frederick Bramwell has intimated to us that he would be sorry to see the collection of building materials abandoned, that he is sure that, with certain modifications, it is a very desirable thing that the collection should continue, and that it will be one of great use.

Under all the circumstances of the case we have come to the conclusion that the maintenance of the structural collection at South Kensington is highly desirable on public grounds, and we strongly recommend my lords to sanction its maintenance, revision, and development. In its present condition we consider that the collection may with advantage be weeded by the removal of such specimens as may be out of date, and of some models

and objects which may not be of practical value. From the vicissitudes which have attended this collection, its frequent removals, and its present scattered condition, it is not in that order which is essential to its proper use, but its rearrangement cannot be effectively carried out until it is placed in a suitable set of rooms.

At the same time there is much to be done to bring the collection up to the present date, and make it thoroughly efficient as a standard for general reference, and as a complete series of illustrations for the technical classes; but we submit that the collection when placed in a proper condition would be of so much value in promoting technical knowledge, that any outlay necessary for this purpose would be greatly outweighed by the public advantage.

### AMATEUR ART DISPLAY AT MALVERN.

**A**N amateur art exhibition was opened last week at Malvern College by Earl Beauchamp. In the course of an address delivered on the occasion, the Earl said it would not be necessary for him either to trace the history of art in England or make any general observations on art. That was a subject which had become one of the commonplaces of conversation. It was said that in the days of Goldsmith the conversation generally ran upon Shakespeare, taste, and musical glasses. Nothing was now heard of the latter, and the whole of the conversation was frequently absorbed in taste. But he did not desire to touch upon burning questions, and should decline to raise the question as to what was the proper position of the sunflower in the realms of art. He would not attempt to dictate on a matter of such great consequence. Something might be said of the use of such exhibitions as these. So much had been done for the application of the principles of art to painting and to other work that many people, if not all, were more or less familiar with those principles. He thought that the bringing about of such an exhibition as this stimulated them to apply themselves more thoroughly to the study of those principles, knowing as they did that they were submitting their works to a larger sphere of criticism than would be met with simply in the drawing-room. Such an exhibition produced a certain amount of concentration of attention to the matter. It showed that very little success was met with in art or anything else without attention was thoroughly given to it. To be done well everything must be done with all one's might, and without these occasional incentives people did not pay so much care to the subject as they should.

### THE NATIONAL GALLERY LOAN BILL.

**A** BILL presented to Parliament by Earl Granville, intitled "An Act for enabling the Trustees and Director of the National Gallery to lend Works of Art to other Public Galleries in the United Kingdom," has just been printed.

The Bill proposes that any two or more of the trustees, together with the director of the National Gallery, present at any meeting specially assembled for the purpose by fourteen days' previous notice, may from time to time order that any pictures or works of art belonging to them or under their control, which in their opinion can be spared from the national collection, shall be lent to any public gallery authorised by this Act.

That any loan of pictures or works of art, in pursuance of this Act, shall be made for such time and subject to such conditions as any two or more of the said trustees, together with the director, present at any such meeting as aforesaid may determine; provided that any profits, which after payment of all expenses may be derived from any exhibition of pictures or works of art at any gallery to which a loan may be made under this Act, shall be devoted altogether to the promotion of science and art.

That pictures and works of art which have been acquired by the said trustees and director under any gift or bequest shall not be lent in pursuance of this Act until the expiration of fifteen years from the date at which such pictures or works of art came into the possession of such trustees and director; and where any such gift or bequest is made on condition that the articles so given or bequeathed should be kept together, or otherwise subject to a condition inconsistent with the same being lent, such pictures and works of art shall not be lent in pursuance of this Act until the expiration of twenty-five years from the date at which such pictures or works of art came into the possession of such trustees and director.

By the expression "public gallery" is meant any gallery in the United Kingdom belonging to or under the control of Government or of any municipal authority or of any society or body approved by any two or more of the said trustees of the National Gallery, together with the director.

By "municipal authority" is meant the Common Council of the City of London, the Metropolitan Board of Works, the town council of any municipal borough in England or Ireland, the town council or police commissioners of any royal burgh in Scotland, also any other local authority which may be approved by any two or more of the said trustees of the National Gallery, together with the director.

## ARTISTIC ASPIRATION IN DEVON.

IN opening the Amateur Art Exhibition last week in Exeter, the mayor, Mr. T. Andrew gave an address. In the course of it he said that it had been thought by the Committee that they would be unable to reproduce a collection equal to the one brought together last year, but he was pleased to say that this year the number of exhibitors and exhibits, and the quality of the work, had altogether surpassed their utmost expectations. This year they had 370 exhibitors, being 100 in excess of the number last year. The number of exhibits, as stated in the catalogue, was about 870, but there were various articles grouped together, bringing up the total number of articles shown to about 900, which was a very considerable advance over the number of last year, and he thought, on referring to the works which adorned the walls, they would come to the conclusion that they had greatly improved on the former exhibition.

At present, the Committee were in straitened circumstances, for although the rooms in which the exhibition was held were commodious, yet they were not what they should be for an exhibition of this nature; and therefore there was all the greater reason why the intention of the Committee to enlarge the museum should be speedily carried out, and he hoped that their efforts would receive the support of the public generally. The present arrangement of the collection in sections involved much labour, and it really became a question as to whether they should continue the present number of sections. It was for the public to express an opinion whether they should continue, as at present, to hold exhibitions of oil and water-colour paintings one year, and of pottery art work the next, as in this matter the Committee would be guided by public opinion.

Having referred to details, he desired to add a few words generally. It must be remembered that this was an Amateur Art Exhibition. They had not brought together the class of work to be found on the walls of the Royal Academy or on the walls of the Grosvenor Gallery. It was not a concentration of the works of the chief artists of the country. The exhibition was confined to local amateur artists; and, taking that into consideration, he thought they must come to the conclusion that the exhibition was a very respectable one. There were two or three exhibits the work of professional artists, but no more; and as this was an exhibition by amateurs they could congratulate themselves on its excellence. The desire of the Committee was to develop local art talent as much as possible, and thereby add to the roll of Devonshire worthies. In a very able paper, read before the Devonshire Association last year by Mr. Pycroft, it was stated that Devonshire occupied the enviable position of being the first county in England, so far as its number of first-class artists was concerned, with the exception of Middlesex, which really meant London, where would be centred the art aspirants, not only of this country, but of the whole world. Therefore, excepting London, they might say that Devonshire had for many generations past stood at the head of all the counties of England in respect to the number of her first-class artists. There were six of these who were of the highest order, as they would admit when they heard their names—Sir Joshua Reynolds, Sir C. Eastlake, Prout, Haydon, Northcote, and Solomon Hart. The works of these artists had been adjudged worthy of occupying prominent positions in the National Gallery. He might also say that among historical painters they had Brockadon, a Totnes man; and they might perhaps remember a famous work of his in the Crown Court at the Castle—*Susannah and the Elders*. There was also in the room in which they were met a work by John Cross, representing the burial of the Princes in the Tower. They also had Sir Charles Eastlake, a Plymouth man, and Director of the National Gallery. They had likewise C. R. Haydon, Hart, Jenkins, King, and Northcote. Among the Devonshire portrait-painters was James Gandy, after whom a street in Exeter had been named. Then they had Sir Joshua Reynolds, the king of portrait-painters, and one of whom England would always be proud, not only for his ability as an artist, but also for his scientific and artistic lectures, which did so much to educate the country in various ways. In addition they had Cosway, of Tiverton, an eminent miniature-painter, although he made a "little silly" of himself on many occasions. There was also Leakey, who greatly distinguished himself as a miniature-painter.

Among the artists remarkable for landscape-painting they had John Gendell, who formerly lived in the house in the Cathedral Yard known as "Mol's coffee-house." He believed that for twenty years or more Mr. Gendell exhibited at the Royal Academy, and his name would be long respected by every lover of art. They had also Thomas Mogford and F. B. Lee, and the two Traies, for whose works just now there was quite a rage. To those they might add, with considerable safety, the name of Wigdery. He questioned very much if any painter had done more to make the West of England known; and whatever might be the value of the work, there was certainly more sale for his pictures than for those of any other man. Then there was Williams, of Plymouth, about whose work there was a remarkable freshness and charm; Miss Grant, of Hillersden, who was an exhibitor there that day; and, with considerable pleasure, he would add Miss Harding, daughter

of a former mayor of the city. It was impossible to look at the picture, *Still Life*, sent by her, without coming to the conclusion that this lady was possessed of considerable power. There was one name which ought not to be forgotten on that occasion, a name which would ever be honoured by Englishmen, and one which Exonians would ever be proud of—he referred to Samuel Cousins, the great mezzotint engraver of the present day, many of whose works were to be seen on the walls of the adjoining room. The esteem in which Cousins was held was shown by the character of the work he was commissioned to execute. They were all proud of his name, and he had no doubt it would be an imperishable one so far as Devon and this country were concerned.

To say a few words on another department of art, viz., pottery. There could be no doubt that a considerable quantity was manufactured in this county during the Roman occupation, and he had no doubt that much which was termed Samian would turn out to be Devonian. He had seen many pieces dug up in Fore Street which he believed were manufactured in this part. During the time of Elizabeth this art was carried on in North Devon, chiefly, he believed, by means of the Fremington clays; and he was pleased to see that Barum ware was still much appreciated. It would also be remembered that for a very long period they had had a very excellent pottery on the Bovey Heathfield, and the ware from that pottery had been exceedingly esteemed, not only in England, but in the South of Europe, where art was much appreciated. All around the Mediterranean there had been an extensive sale for Bovey ware. Since attention had been given to the terra-cotta an interest had been given to china-painting. He believed the production of this was likely to considerably develop, and that china-painting might become one of the great industries of Devon. As they had lost some local industries by the march of science, they should make the best use of the opportunities which providence and science offered them in other directions. He might say that Devonshire was noticeable for its felspathic clays, and around the moors at the bases of the granite bosses there were large quantities of it. We had also flint, lead, and manganese, important requisites in the manufacture of pottery, and there was no reason why Devon should not take advantage of them. Why, he would ask, should Worcester stand pre-eminent when in Devonshire they were surrounded by art materials? The surface conformation of Devonshire was second to none in England. What could surpass Dartmoor, with its various Tors, still surrounded by what he might term *primaeva* nature? What could be more beautiful than the beautiful gorges and rock scenery of North Devon? What could surpass the inimitable beauty of South Devon? There was everything needed to develop artists, and if latent talent was only brought out there was no reason why employment might not be found for a large class of persons, and Devonshire become noted for its art products. The desire of the Committee was to make this exhibition an art centre, and he believed their efforts would be appreciated by the public generally.

## THE SITE OF THE NEW PUBLIC OFFICES.

THE protest signed by the Chairman of Committees, Lords Fortescue, De l'Isle and Dudley, and Stratheden, and lodged in the House of Lords against the Public Offices Site Bill, runs as follows:—"That they dissent because that which is known as the Parliament and Great George Street site has long been considered the proper one for the Admiralty and the War Office, and a considerable amount of property on it has been purchased by Government, and a large extent of public land left unprofitably vacant for many years on that account. Because the adoption of that site secures the widening of Parliament Street, with a continued frontage of public offices, as the approach to the Houses of Parliament and Westminster Abbey, which necessary widening is far from certain to be obtained in any other way, and certainly not with the same class of buildings. Because the adoption of that site will leave the Admiralty undisturbed as regards the members of the Board, its business and official documents, until the new buildings are finished, and allow the Paymaster-General also to remain in his present office. Because the present Bill only gets possession of the Spring Gardens property, unaccompanied by any plan of the manner in which the buildings to be erected on it are to be applied to the Admiralty and War Office respectively, or of their architecture and elevation, leaving it uncertain whether the site will afford sufficient accommodation for those two great offices, or how far the aspect of the Horse Guards and Parade may be deteriorated by the new buildings. Because if the Admiralty is transferred to a new site, the present Admiralty buildings will give the means of concentrating in an economical manner, in a most convenient situation, a number of small offices now scattered over the town at a great expense and inconvenience. Because the Bill is not sanctioned by the inquiry which took place in 1874 or the evidence taken in 1877. Because the scheme has been condemned by the Royal Institute of Architects, is unsupported by any similar authority, and has been brought forward in a manner which shows great indifference to the importance of securing the improvement of our capital in the construction of public buildings by a careful regard to their architecture and position."

## NOTES AND COMMENTS.

WE mentioned last week that the building committee of the proposed church on the West Cliff, Whitby, had suddenly rescinded the appointment of Mr. C. NOEL ARMFIELD as architect in favour of Mr. JOHNSON, of Newcastle. A letter had been received from Sir G. ELLIOT in which the writer, alluding to his promise of a site and 2,000*l.*, reminded the committee that they had forgotten the conditions attached to the gift, namely, that he should be consulted as to the appointment of the architect. In consequence of the receipt of this letter the extraordinary proceedings above mentioned—if any proceeding can be called extraordinary where the appointment of an architect is in question—took place. The question does not in any way turn upon the respective merits of Mr. ARMFIELD or Mr. JOHNSON, for both architects are known as designers of churches, but rather upon the relations between Sir GEORGE and the committee. At present a certain amount of vagueness hangs over the whole business. Assuming that Sir G. ELLIOT had “stipulated to be consulted,” people will ask if by that expression it was meant that Sir GEORGE was to have the appointment in his own hands, and that the committee were to have no voice in the matter? No public mention appears to have been made previously of Sir GEORGE ELLIOT’s reservation. It was merely stated that the plans of the building were to be submitted to him, which was a reasonable precaution. It is incomprehensible how a committee of business men could deliberate upon the appointment of an architect, although they were altogether without authority, and yet the expedition with which they nullified their own acts suggests that they have been blundering for several months. The case is another example of the free-and-easy way in which an architect can be victimised.

A LARGE number of members and visitors attended on occasion of the annual meeting of the London and Middlesex Archæological Society, which was held at Silchester on the 17th inst. Mr. F. G. HILTON PRICE, F.S.A., who had prepared an elaborate paper for the occasion, was unfortunately prevented from being present; his place, however, was supplied by Mr. JAMES PARKER, who conducted the party over the various points of interest. On the way to Silchester the old mansion of the “Vyne” was visited, and some notes on its history, written by the owner, Mr. C. W. CHUTE, were read by the Hon. Secretary: drawings of this interesting house can be found in Dollman’s “Analysis of Architecture.” The next session of the Society commences in November, and it can here be recorded that by the recent resignation of the Hon. Secretary, Mr. G. H. BIRCH, A.R.I.B.A., the members will have lost an able and a zealous worker for the Society.

THE forging of bank-notes has of late been carried to such perfection that the Bank of France has decided upon making a change in the design of its paper-money. The new model is designed by the painter BAUDRY and engraved by ROBERT. M. BAUDRY first of all sketched the note on a board 3 mètres long by 1½ high, and then, before confiding it to the engraver, had it reduced by photography to the ordinary size. The engraving, which was done by M. ROBERT on the premises of the Banque de France, lasted several weeks. Sixty millions of 100 franc notes of the new design will be issued towards the end of next October, after which all the old notes brought into the Bank or its branches will be destroyed.

AT the last session of the Council-General of the Department of the Seine a proposition was adopted to open a competition among artists for the decoration of the Salle des Mariages at the Mairie de Saint-Maur-les-Fossés. A sum of 1,800*l.* is to be placed at the disposal of the victor for the carrying out of his plans, while prizes of 80*l.* and 40*l.* respectively will be awarded to the second and third in the competition. To English readers this must seem a large amount to spend on the embellishment of a single room in the purely local mairie of a small district, but French public bodies, emanating from universal suffrage, are evidently becoming every day more inclined to vote money for the advancement of education and art, and their example might well be followed, if only on a small scale, by the municipal authorities of Great Britain.

THE French War Offices are now being considerably enlarged. On the Rue de l’Université side, new buildings, occupying a space of 60 mètres in frontage, by about the same in depth, are now in course of construction, and when these and some other smaller additions are complete, the War Ministry will occupy the whole of the large space bounded by the Boulevard Saint-Germain, the Rue Solferino, the Rue Saint-Dominique, the Rue de l’Université, and the public gardens of the Rue de Bourgogne.

NOTWITHSTANDING that upwards of 1,100 new buildings are now being erected in Paris, house rents are rising every day. An association of capitalists has purchased several large plots of ground in the Trocadéro quarter with a view to the erection of a different class of dwelling-house to anything yet tried in Paris. These buildings, the architect of which is M. FRONQUOIS, will occupy an intermediate position between the private mansion (*hôtel particulier*) and the ordinary building let out in unfurnished suites of apartments, with the view—so runs the prospectus of the owners—of affording to rich tenants all the luxury, comfort, and convenience of a high-class private house without being obliged to lock up a large capital. These buildings will contain only basement, ground-floor, and two storeys, so that the various floors can be made much loftier than is usual; thus the rooms on the *rez-de-chaussée* will be no less than 5 mètres in height, and those on the others 4 mètres, while each storey will be built with large bay windows, a thing unknown in ordinary Paris houses. There will be but one tenant on each floor, and some idea may be obtained of the present scale of rents in the French capital from the fact that these flats are expected to be let easily at from 18,000 to 25,000 francs apiece. Another innovation will be made in providing servants’ bedrooms on each floor within the apartment of their employer. At present in all large buildings the domestics of both sexes and of all the various tenants are obliged to sleep in garrets on the fifth or sixth storey, opening sometimes twelve or fifteen of them on to the same corridor.

IN connection with the passing of the Ancient Monuments Bill a correspondent remarks that in the list of monuments to be protected none of the ancient monuments in Lancashire are included. “It seems to me,” he says, “from a comparatively recent visit made to the spot, that the so-called Druid’s Circle on the top of Chetham’s Close, Turton, near Bolton, is quite worth protection. The circle was nearly complete, but one of the stones composing it had recently been smashed by Vandal hands. I believe there is quite as much reason for calling these Druidical remains as most others. Then there is the Roman road embankment in the Fylde district, and some tumuli called *lowes* exist west of Whalley, which are said to mark the site of a great battle in Saxon times. There is the tumulus at Penwortham, and I have no doubt others in the county, which are worth a paternal protecting hand to pass them on safely down to posterity.”

A PARTY of the archæological section of the Birmingham and Midland Institute were on Saturday conducted for a ramble by Mr. J. A. COSSINS, the hon. secretary, from Salford Priors to Abbot’s Salford, Norton, and Harvington. Harvington Hall, at Abbot’s Salford, was visited—a large, rambling, seventeenth-century mansion, once the seat of the CLARKE family. The mansion, though of rather poor Jacobean architecture, with coarse details, is an imposing and picturesque mass, the view from the court being especially fine. At Norton, a pretty village, with many half-timbered houses, there is a small church of the fourteenth century. The north transept forms a well-preserved mortuary chapel of the BIGG and CRAVEN families, containing imposing monuments of the sixteenth and seventeenth centuries, with recumbent and kneeling alabaster effigies and quaint inscriptions. Military trophies and banners hang from the walls and ceilings. The reading-desk is a great curiosity, and belonged originally to the Abbey of Evesham. At Harvington the church is chiefly of the fourteenth century, without aisles. It contains some good traceried windows; but the tower is of the greatest interest, being of early Norman construction, with double belfry lights, divided by a small column. The walls, of extreme thickness, and the wide-spreading base, are both evidences of great antiquity. Many interesting half-timbered houses and picturesque bits were found in this pleasant village.

ROYAL ACADEMY GOLD MEDAL DESIGN: A CASINO.

WE publish this week the perspective view of the design, by Mr. JAMES HOWARD INCE, to which the Gold Medal of the Royal Academy and a travelling studentship of 200*l.* were awarded. The subject is a casino or club for an inland watering-place, the accommodation required being a large assembly or concert hall, with open arcades or balconies, a small theatre, café, dining, reading, smoking, billiard, and card rooms, with the necessary offices; the building site being limited to 200 feet by 150 feet, with a garden or entrance-court in front 100 feet deep, showing a fountain. The conditions required all the work to be done in the Academy within six weeks, between the hours of 9 and 5.

Mr. INCE places his rooms as much as possible on the ground floor, prominence being given to the great hall, which opens on to a terrace, and from the galleries on to a wide balcony, whilst extra seats are afforded by a second end gallery over the card-rooms on the first floor, for which a special staircase is provided, besides the turret stair. But the most characteristic feature, as will be seen by the section and plan, is the open-air café, round which the buildings are grouped. It should, however, be borne in mind, that this is not only a design for a casino, but also for an academic prize, demanding a certain severity and dignity of effect—two conditions not strictly compatible.

The design was among the architectural drawings exhibited at the Royal Academy this year.

## BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE annual congress of this Association opened at Plymouth on Monday, the members being received by the Mayor at the Guildhall. In welcoming the Association, the Mayor, Mr. Burnard, said they had formed a high estimate of the important researches which formed the special features of the studies of the Association, and anticipated from the programme drawn up that a rich harvest would be reaped.

Mr. T. Morgan, F.S.A., in responding, said that unfortunately the Duke of Somerset was prevented from presiding by illness, but that Sir James Picton had kindly come down to take his place. The series of historical windows in the hall having been inspected, as also the Corporation plate and insignia, a paper on the "Borough Records" \* was read by Mr. R. N. Worth, F.G.S. In the afternoon various buildings of interest in the town were visited, the first being the church of St. Andrew, rebuilt in the Perpendicular period.

## Church of St. Andrew and Charles Church.

Mr. Worth described the church as being the mother-church, not only of Plymouth, but of the neighbouring parishes. Recent researches had enabled him to gather information which threw light on the long-debated relation of the adjacent abbey to the church. There was evidence that it was not an abbey at all, but the old "prysten" or clergy-house of the town. Rent was paid to the Corporation for the "prysten-house" in the reign of Henry VI.; and at a much later date, early in the sixteenth century, there was a record of a grant by the Corporation to "Sir" Thomas Flyte, charity priest of the "prysten-house," for life, in consideration of his outlay in repairing the kitchen.

Mr. Loftus Brock, F.S.A., said he had come upon an old record which referred to a subterranean passage under the church. There was no doubt that this passage led into a crypt, and that crypt led into the clergy-house. Mr. Brock also referred to the fact that the recorded history of the church tallied very badly with the architecture. This was the common characteristic of Devonshire churches. There was, too, the same remarkable similarity to the mouldings which ran through the churches in the county, the rough carvings being the result of the use of granite.

After inspection of the abbey, Charles Church was visited. Few examples of post-Reformation Gothic buildings, Mr. Brock said, existed, and this was one of the finest in the kingdom. Some of its features seemed to have been taken by the architect from the church of St. Andrew and the cathedral at Exeter; it was also an illustration of how a love of the Gothic style had lingered in the country.

## The Old Dominican Monastery.

The old Dominican Monastery in Southside Street, now used as a distillery, was next visited. On the way thither a house at the corner of Love and Buckwell streets was pointed out as the site of the residence of Sir Francis Drake, evidence of his occupancy having only come to light within the past few weeks. No trace,

however, remained of the original house. Having entered the distillery Mr. Worth said there could be no doubt they were gathered within the walls of the house of the Blackfriars of Plymouth (the only habitable remnant of their religious homes), though all that was really known about it might be put in half a dozen lines. After the Dominicans were ejected it came in to the hands of the Corporation, who long used it as the town Marshalsea. In 1672 it became the first meeting-place of the Plymouth Nonconformists after Bartholomew, under Nicholas Sherwill; and later it was occupied by a congregation of Huguenots. For nearly a century it had been a distillery. What remains of the refectory is so perfect structurally that it could be restored to its pristine condition without difficulty. Mr. Brock called attention to the singular beauty of the roof, the design of which he hoped to see reproduced. They had only a fragment of the monastery, but it was a very interesting fragment—one of the most interesting in its way he had ever visited.

A typical Elizabethan house was afterwards pointed out by Mr. Worth, in Notte Street. While they had lost within a very few years nearly all their old landmarks—dozens of picturesque gabled houses, and the stately quadrangle once visited by Katharine of Arragon, and Palace Court; this finest of all their domestic examples, he was glad to say, was in hands that would guard it heedfully. Its owners, Messrs. Bulteel & Co., of the Naval Bank, not only intended to preserve it with all care, but were about to complete the façade on each side with buildings of kindred character.

A short visit was also paid to the Cottonian Library.

After the dinner Sir James Picton delivered the presidential address,\* which concluded the proceedings of the first day.

On Tuesday a visit was paid to Buckland Abbey, in the neighbourhood of Tavistock.

## Buckland Abbey.

Approaching the Abbey by an avenue of trees, the barn, a substantially-built structure, about 180 feet long, with buttressed walls and high-pitched roof, was first reached. Mr. Brock described it as one of the best features of the ancient buildings, being the least unaltered. The church and other monastic buildings were all interfered with by buildings of a later date, while every stone of the barn seemed to be original. The building was probably older than the foundation of the Abbey. He attributed it to the close of the fourteenth century, the buildings of the Abbey being seventy or eighty years earlier. The roof of this barn was original, and there appeared in it no sign of work of a later date. The plan of the barn was usual for that of a monastery barn—a long nave with a transept which formed the entrance. They had evidence in this spacious building of what good farmers the old monks were.

Leaving the barn, the party proceeded to the Abbey, or rather what remains of it. Since the days of Elizabeth, by whom it was given to Sir Francis Drake, the building has been turned into a dwelling-house. It still belongs to the Drake family.

Mr. Brock, who here read a paper, said it was seldom that they had the advantage of inspecting the remains of so varied a number of the houses of the religious orders once so numerous in our land as during their present congress. At Tavistock they would see the remains of the older order of Benedictines; Plympton was for Austin Canons; and at Tor Abbey they would see the site of a Norbetine or Premonstratensian house, one of the so-called Reformed Orders, placed away from the haunts of men. Here at Buckland the site plainly showed, in its low valley beside the stream, that they were on the site of an abbey of Cistercians. It had been founded by Amicia, the wife of William Earl of Albemarle. The site, acquired from her daughter Isabella, was confirmed to the monks by King Edward I. in 1275, and she signed the foundation-deed in 1280. The monks for the new colony were brought from Quarr Abbey, in the Isle of Wight. The dates showed it to be one of the latest foundations in England; and beyond the record of its foundation and dissolution there was little to say of its history. This was not to be wondered at when they considered the nature of the order and its position, far away, excepting the few contiguous villages, from any large centre of human life. It was curious, in relation to the churches of the Cistercian Order, that hardly one was now used for divine service. Wreck and ruin had fallen on many a fair building of the other orders, but yet many were retained at the Dissolution. This was doubtless because the sites were still away from the population in the sixteenth century almost as much as at the time of the foundation, none being wanted for use, as churches were demolished for the sake of the material only. Here at Buckland was a curious and unusual example of its retention. While destruction has fallen on the domestic buildings, which were in other places so frequently retained, here the church was kept standing, and was converted into a dwelling-house. They were within it now. The outer walls were for the most part those of the sacred fabric, and no doubt they were parts of the building as originally erected. The plan was peculiar for a Cistercian church. It consisted of a spacious nave, which had no aisles, and had never had any. A low central tower, which was still intact at

\* See page 127.

\* See page 125.

the crossing—if that term could be used—where there was but a single transept on the south side, and no north transept. There was also the usual short presbytery to the east, rather less than the usual square on plan, the breadth being a little more than the depth. On the north side a vestry or chapel extended up to the east end from the east line of the tower, and ended square with the east end. It was approached from the presbytery by a small square chamber at the west. The fine and once open arches of the tower could be traced here and there, where not covered over by the walls and floors of the modern house. They were pointed, and of three plainly chamfered orders, that to the presbytery being lower than the others. The original arrangements of the church were as anomalous as its present appropriation, and it was sufficient to show that the establishments of the Cistercians were not always on the same unvarying plan as some believed. The anomaly of the position of the cloisters and chapter-house, too, at Buckland was very apparent, for they had been on the cold and sunless north side of the church rather than on the south as is usual. There were many objects of interest of that date remaining. Apart from the well-known portrait of Sir Francis Drake, who lived there many years, there was a curious chimney-piece with his arms in the tower. It was later than his time, since it bore the date 1655. Much of the carving in the hall was said to have been brought from other old manor-houses—Durance and Callisham—by members of the Drake family. Over the fireplace was the date 1576.

#### Buckland Monachorum Church.

From the Abbey the party proceeded to the picturesque village of Buckland, every house of which, Sir James Picton pointed out, contained some traces of the hand of the mediæval builder, and among the mediæval features thus noticed pointed arch doorways and mullioned windows occurred, evidently brought from the Abbey or elsewhere. A visit being paid to the church, Mr. Brock remarked that the church was different from the usual type of Devonshire churches, from the fact that it had transepts both to the north and to the east, and that there was a chancel arch with a smaller chancel than the nave. The wooden fifteenth-century roof was particularly fine in character. In most of the county churches, the roof was continuous, but here it was different. The work here, too, was of an earlier date than that which the members had hitherto seen. It was entirely built of granite, and the traceries were deeper and more sharply defined than was usually found in Devonshire edifices. None could help being struck by the skilful way in which our ancestors worked the hard and impracticable granite. It was here treated as we should now treat Bath stone, whilst the builders had taken advantage of the huge blocks, the pillars being over 12 feet from capital to base. The original seats had been reverently removed, the original wood being preserved where possible. Especially worthy of observation was the beautiful groined roof of the chantry chapel. The granite was marvellously worked, and there was no reason to doubt the tradition at the abbey, that it was brought from the abbey itself. At any rate, there was some Perpendicular work at the abbey with which it would correspond. A curious feature in the chancel end of the church was the headway left in the right-hand supporting column of the chancel arch, which indicated the existence formerly of a rood loft. In these days, when it was the fashion to speak lightly of modern monuments, it was very gratifying to find in Buckland Church so magnificent a specimen of sculpture as that which commemorated the bravery of Elliot, Baron Heathfield, in holding Gibraltar against the overwhelming force of the enemy.

#### Stone Monuments.

On leaving the church a disagreeable change in the weather took place, and the rest of the programme was abandoned, and an early return was made to Plymouth by the main body. A few of the party, however, under the guidance of Mr. C. W. Dymond, F.S.A., reached the Clycpean Bridge at Blackabrook. This, Mr. Dymond explained, was one of the smallest bridges on Dartmoor, and one of a class of which there were several of considerable antiquity, without, however, there being any clue to the date. Stone monuments of a primitive age abounded in the district, but with few exceptions they were constructed with small materials and far from being imposing. These remains, like similar ones elsewhere, might be roughly divided into four classes—domestic, military, ceremonial, and sepulchral. Among the first are hut circles, well preserved specimens of which are those by Merivale Bridge. The most notable of the military was Grimspound. Of the ceremonial remains there were several near by, foremost among them being the avenues, which are the longest on Dartmoor. An inspection, however, of these could not be made.

At the evening meeting a paper was read by Sir James Picton, entitled "Glimpses of Municipal Life in the Olden Times," illustrating the progress of self-government and of the development of social and civic life, drawn from the very interesting records of the borough of Liverpool. These dated back to the incorporation of that borough by King John in 1207, and the charter of that monarch is now extant.

A second paper was then read by the Rev. W. S. Lach-Szyrma

on "Drake and his Voyage of Circumnavigation," shortly after which the proceedings of the day terminated.

On Wednesday the members made an excursion to Totnes, where a steamer conveyed them down the picturesque River Dart to Dartmouth. Here the church of St. Saviour was visited, and subsequently the Butter Walks, which is similar to the Rows at Chester. Dartmouth Castle having been visited, a return was made to Totnes, where the church, old guildhall, and castle were inspected. The party were entertained by the Mayor and Corporation, and return was made in the evening to Plymouth, which was reached soon after ten. The programme for Thursday comprised visits to Tavistock and the neighbourhood.

#### THE DURBAN TOWN HALL COMPETITION.

At a meeting of the Corporation of Durban, Natal, held on July 6, the first premium of 100*l.* was awarded to the set of drawings marked "???", by Mr. P. M. Dudgeon; and a second premium of 50*l.* to the drawings marked "Nemo," by Mr. Samuel Musgrave, A.R.I.B.A., of Trinity House Lane, Hull. The *Natal Mercury*, in criticising the plans previously to the above decision, says:—

"???" is a beautiful and effective design in pure Classic style. The drawings are tinted in sepia, a very appropriate manner of finishing them. Taking the design as a design, it should take the foremost rank in the competition, being a fine specimen of good architecture. Such a design, however, should be carried out in stone, otherwise its appearance and stability would not be such as to render it as complete a work of art as it appears on paper. The cost of building it in stone would unfortunately be far beyond the reach of the funds at the disposal of the Corporation. The arrangement on plan is, again, second to none, and far superior to most of the other designs. The architect appears, in fact, by some happy knack, to have placed every one of the most important chambers of the building in the most prominent position. It would be difficult to disparage the entirely tasteful and artistic *tout ensemble* which externally the design presents, or to make any feasible or sensible suggestion as to any alteration which would be an improvement in the arrangement of the interior. The architect furnishes five drawings, one of which is not shown on the walls of the Council-chamber, but that one indicates that the architect does not contemplate any elaborate ornamentation or finish inside the building. On the ground-floor are the Government offices, the Borough Solicitor's and Engineer's offices, and the Magistrates' Court-rooms, whilst the Chamber of Commerce and the Council-chamber are situated upstairs. This design will certainly claim the earnest consideration of the Council in their deliberations.

"Nemo" is a design in the Early English ecclesiastical style. It consists of a perspective drawing, two elevations, all of which are carefully executed plain line shaded drawings, and a ground and first floor plan. The main front, as in all the others of the competition, is to West Street, and is exactly centred in a clock tower of good and solid proportions, though not carried so high as the other towers of the drawings showing such features in the designs. The tower is surmounted by a bell-loft constructed in the Old English timber style, and this, although in good taste, so far as the style is concerned, cannot but meet with criticism as being too pronounced an adjunct of a church steeple to warrant its introduction on the tower of a town-hall. The architect is evidently a gentleman experienced in the study of ecclesiastical architecture, and although there is hardly any description of architecture which has more earnest admirers and champions than the Gothic, it is questionable if it is altogether advisable to strictly adhere to it in its entirety in many cases. The tower generally, however, is most pleasing, and is relieved and set off by turrets and a balustrading round the loft, which has a very good effect; but we shall be surprised if the popular verdict will not be to the effect that it "looks too churchy." This feature will certainly be considered as one of the least desirable in the design; but as even qualified professional opinion is likely to vary upon the point, we merely mention it without prejudice to the general excellence of the design *per se*. The adjoining building to the tower is slightly depressed, bringing out in bold relief the wings which are carried higher on either side, and in the centre, behind the tower, the roof of the great hall is visible, which breaks the outline in an effective, artistic manner. Round the West Street, Gardiner Street, and Church Street fronts there is a covered arcade, supported on Gothic brick columns and arches, and on this the first floor is carried over, projecting from the main walls of the lower storey, flush with the street line. This is a special feature of the design, and one which gives it a distinctive character in the competition. The windows are all pointed, mostly triple, with stone quoins and mullions. The building is apparently intended to be carried out principally in faced brickwork, relieved by stone or brick mouldings and dressings. The roofs, which cover a broad span, would appear less crude in construction than on paper. The depressed sections of the building on either side of the tower are recessed, which admits of balconies being intro-

duced over the arcade. The side elevations are well in unison with the front. There is very little to be complained of in the planning, economy of space being well combined with convenience and utility. On the ground floor is the great hall in the centre, carried up to and including the first floor, which shows a suggested gallery running all round the chamber, and retiring-rooms, &c., are provided beneath the orchestra and organ staging. On the left-hand side are situated the Government and Telegraph offices as stipulated, an area dividing the same to a great extent from the hall. On the right-hand side are the Town Clerk's and assistant Town Clerk's and private offices, also the Court-room, Magistrates' and Public offices and retiring-rooms—the latter being lighted from another area—and there is a vestibule, the principal entrance to the hall. On the first floor, left-hand side front, is the Council Chamber; at the back the Chamber of Commerce; also the Engineer's private office, Clerk's office, and Telegraph offices. On the left side is a long area by the Public Hall, the upper part of the Court-room, three rooms for the Town Solicitor's offices, the Mayor's room, Committee-room, and a corridor in front of the hall. The design is a very creditable one in every way, and one of those certain to be reserved for the final consideration of the Council, when, out of the ruck, the final selection will be reduced to a choice, perhaps between three or four. The drawings are uncoloured, a condition which the Council would have done well to have made compulsory on all the competitors. We are enabled to surmise from the remarks we overheard in the room, that one of the designs obtains special favour in the eyes of the gentlemen whose opinion will be of considerable moment in the final decision; but we may remain confident that such predilection, based on the beauty and artistic merit of the production, will not be unduly exercised, and that all the designs worthy will be freely and impartially considered on their various claims and merits when the council shall frame its final verdict.

### THE BRITISH ASSOCIATION.

THE fifty-second meeting of the British Association was opened at Southampton on Wednesday. Dr. Siemens delivered the presidential address, in the course of which he said: It can no longer be a matter of reasonable doubt, therefore, that electric lighting will take its place as a public illuminant, and that even though its cost should be found greater than that of gas, it will be preferred for the lighting of drawing-rooms and dining-rooms, theatres and concert-rooms, museums, churches, warehouses, showrooms, printing establishments, and factories, and also the cabins and engine-rooms of passenger steamers. In the cheaper and more powerful form of the arc light it has proved itself superior to any other illuminant for spreading artificial daylight over the large areas of harbours, railway stations, and the sites of public works. When placed within a holophote the electric lamp has already become a powerful auxiliary in effecting military operations both by sea and land. The electric light may be worked by natural sources of power, such as waterfalls, the tidal wave, or the wind, and it is conceivable that these may be utilised at considerable distances by means of metallic conductors. The advantages of the electric light and of the distribution of power by electricity have lately been recognised by the British Government, who have just passed a Bill through Parliament to facilitate the establishment of electrical conductors in towns, subject to certain regulating clauses to protect the interests of the public and of local authorities. Assuming the cost of electric light to be practically the same as gas, the preference for one or other will in each application be decided upon grounds of relative convenience, but I venture to think that gaslighting will hold its own as the poor man's friend. Gas is an institution of the utmost value to the artisan; it requires hardly any attention, is supplied upon regulated terms, and gives with what should be a cheerful light a genial warmth, which often saves the lighting of a fire. The time is, moreover, not far distant, I venture to think, when both rich and poor will largely resort to gas as the most convenient, the cleanest, and the cheapest of heating agents, and when raw coal will be seen only at the colliery or the gasworks. In all cases where the town to be supplied is within say thirty miles of the colliery, the gasworks may with advantage be planted at the mouth, or still better at the bottom, of the pit, whereby all haulage of fuel would be avoided, and the gas, in its ascent from the bottom of the colliery, would acquire an onward pressure sufficient probably to impel it to its destination. The possibility of transporting combustible gas through pipes for such a distance has been proved at Pittsburg, where natural gas from the oil district is used in large quantities. The quasi-monopoly so long enjoyed by gas companies has had the inevitable effect of checking progress. The introduction of the electric light has convinced gas managers and directors that such a policy is no longer tenable, but must give way to one of technical progress; new processes for cheapening the production and increasing the purity and illuminating power of gas are being fully discussed; and improved burners, rivaling the electric light in brilliancy, greet our eyes as we pass along our principal thoroughfares. The hurtful influence of smoke upon public health, the great personal discomfort to which it gives rise, and the vast expense it indirectly causes through the destruction

of our monuments, pictures, furniture, and apparel, are now being recognised, as is evinced by the success of recent smoke abatement exhibitions. The most effectual remedy would result from a general recognition of the fact that wherever smoke is produced fuel is being consumed wastefully, and that all our calorific effects, from the largest down to the domestic fire, can be realised as completely, and more economically, without allowing any of the fuel employed to reach the atmosphere unburnt. This most desirable result may be effected by the use of gas for all heating purposes, with or without the addition of coke or anthracite.

Speaking of engineering works, Dr. Siemens said:—The time allowed me is wholly insufficient to do justice to the great engineering works of the present day, and I must therefore limit myself to making a short allusion to a few only of the more remarkable enterprises. The great success, both technically and commercially, of the Suez Canal has stimulated M. de Lesseps to undertake a similar work of even more gigantic proportions—namely, the piercing of the Isthmus of Panama by a ship canal, 40 miles long, 50 yards wide on the surface, and 20 yards at the bottom, upon a dead level from sea to sea. The estimated cost of this work is 20,000,000*l.*, and more than this sum having been subscribed, it appears unlikely that political or climatic difficulties will stop M. de Lesseps in its speedy accomplishment. Through it China, Japan, and the whole of the Pacific Ocean will be brought to half their present distance, as measured by the length of voyage, and an impulse to navigation and to progress will thus be given which it will be difficult to over-estimate. Side by side with this gigantic work, Captain Eads, the successful improver of the Mississippi navigation, intends to erect his ship railway, to take the largest vessels, fully laden and equipped, from sea to sea, over a gigantic railway across the Isthmus of Tehuantepec, a distance of 95 miles. Whether or not M. de Lesseps will be successful also in carrying into effect the third great enterprise with which his name has been prominently connected, the flooding of the Tunis-Algerian Chotts, thereby re-establishing the Lake Tritonis of the ancients, with its verdure-clad shores, is a question which could only be decided upon the evidence of accurate surveys; but the beneficial influence of a large sheet of water within the African desert could hardly be matter of doubt.

It is with a feeling not unmixed with regret that I have to record the completion of a new Eddystone Lighthouse in substitution for the *chef-d'œuvre* of engineering erected by John Smeaton more than 100 years ago. The condemnation of that structure was not, however, the consequence of any fault of construction, but was caused by inroads of the sea upon the rock supporting it. The new lighthouse, designed and executed by Mr., now Sir James Douglass, engineer of Trinity House, has been erected in the incredibly short time of less than two years, and bids fair to be worthy of its famed predecessor. Its height above high water is 130 feet, as compared with 27 feet, the height of Telford's structure, which gives its powerful light a considerably increased range. The system originally suggested by Sir William Thomson some years ago, of distinguishing one light from another by flashes following at varied intervals, has been adopted by the Elder Brethren in this as in other recent lights in the modified form introduced by Dr. John Hopkinson, in which the principle is applied to revolving lights, so as to obtain a greater amount of light in the flash.

The geological difficulties which for some time threatened the accomplishment of the St. Gothard Tunnel have been happily overcome, and this second and most important sub-Alpine thoroughfare now connects the Italian railway system with that of Switzerland and the south of Germany, whereby Genoa will be constituted the shipping port for those parts. Whether we shall be able to connect the English with the French railway system by means of a tunnel below the English Channel is a question that appears dependent at this moment rather upon military and political than technical and financial considerations. The occurrence of a stratum of impervious grey chalk at a convenient depth below the bed of the Channel minimises the engineering difficulties in the way and must influence the financial question involved.

Whether the Channel Tunnel is constructed or not, the plan proposed some years ago by Mr. John Fowler, of connecting England and France by means of a ferry-boat capable of taking railway trains, would be a desideratum justified by the ever-increasing intercommunication between this and Continental countries. The public inconvenience arising through the obstruction to traffic by a sheet of water is well illustrated by the circumstance that both the estuaries of the Severn and of the Mersey are being undermined in order to connect the railway systems on the two sides, and that the Firth of Forth is about to be spanned by a bridge exceeding in grandeur anything as yet attempted by the engineer. The roadway of this bridge will stand 150 feet above high-water mark, and its two principal spans will measure a third of a statute mile each. Messrs. Fowler & Baker, the engineers to whom this great work has been entrusted, could hardly have accomplished their task without having recourse to steel for their material of construction, nor need the steel used be of the extra mild quality particularly applicable for naval structures to withstand collision, for, when such extreme toughness is not required, steel of very homogeneous quality can be produced, bearing a tensile strain double that of iron.

## THE INFLUENCE OF RACE ON ARCHÆOLOGY.

THE session of the Cymmrodorion Society, in connection with the National Eisteddfod, was opened on Monday at Denbigh by Dr. Richardson, of London, with an inaugural address on "Races of Man and Life on English Soil."

He commenced by saying that the races of men form the frictional surfaces by which, in natural collusion, the knowledge and wisdom which make life worth having are struck out. If one race having the same tastes, desires, hopes, traditions, language, arts, literature, and aptitudes were to become the exclusive inhabitants of the planet, it would become a Babel, and fall, probably, a prey to the lower untamed forms of animal life. He then proceeded to describe the races of men on English soil, relating his own researches on this subject. He next discussed the races in detail—the Saxon, the Celtic, the Jewish, and the Gipsy—as they exist amongst us at the present day. He defined the peculiarities of each race in respect to physical conformation, mental disposition, artistic tastes, perceptive and reasoning powers, &c. After these descriptions, in which the differences of the races were minutely detailed, Dr. Richardson pointed out that the different races were to a considerable extent distinguishable by their surnames. Thus the members of the Saxon race were most commonly known by names indicating trades, as Smith, Miller, Carpenter; or by a name denoting some substantial thing, as Wood, Stone, Hill; or by an office, as Judge, Sheriff, Warder; or by a town or place; or by a colour, as Black, White, Brown; or by a name with the word "son" as a suffix; or by a combination of terms, with the letters or term "ard" introduced, as in Rickardson or Richardson. The members of the Celtic race are more commonly known by a name indicating a quality, as Jolly, Merry, Gay; or by a name with a prefix, such as O in O'Neale, meaning the grandson of Neale; Mac, as in MacDougal, meaning the son of Dougal; ap, as in ap Rhys, ap Howell, ap Roger, ap Richard, names now often modified into Price, Powell, Prodger, and Pritchard; or again by putting a name in the genitive case with a Christian name, as David Williams, David son of Williams, a plan which the late eminent scholar Mark Antony Lower has shown to have been common in Wales; or by the affix de to a name, as in de Merveil-loux. The Jewish are more commonly known by original Jewish words, such as Moses, Solomon, Abraham; or by modifications of these, as Moss, Salmon, Brahm; or by Latin words, such as Magnus; or by borrowed names, such as Lawson and Lawrence. Very many of this race are known by the names of animals, as Lion, Wolf, Hare, Hart, Fox, and the like. The members of the gipsy race cannot be said strictly to have any distinct surname; but when they emerge from the nomadic state they are given to borrow or assume a few names for which apparently they have a special liking. To the gipsy race the author ascribed much more latent talent than is usually attributed to it.

Dr. Richardson next dwelt on the question of admixture of the races. In the admixed families, Saxon-Jewish, Celtic-Jewish, Saxon-Celtic, the dominant type may usually be read, the pigments or colouring substance of the eyes, the hair, the complexion, being as distinct as the mental peculiarities. The purest Saxon-Jewish family type is the blue eye and fair skin with dark brown hair, or the hazel eye with dark hair and fair skin. The purest Saxon-Celtic family type is the blue eye with ruddy complexion and golden hair. This in the young is the most beautiful of combinations. The Celtic-Jewish family type is very characteristic; the eyes hazel or amber-coloured, the hair rich brown or auburn, the complexion ruddy but a shade dark, the nose aquiline and exquisitely chiselled to features of Semitic cast, the tastes strong for music and for the pursuit of all that is pleasant in nature out of doors.

He then referred to the future of the three principal races as follows:—The three races—Saxon, Celtic, Semitic—in this day strive together, react on each other, and on the whole beneficially. The Saxon goes to the fringe of some new continent, carrying with him his other self, his lever, his mattock, spade, plough, axe, and other tool or engine. He cuts into the forest, he digs into the earth, he levels the roads, he builds rude houses, warm and comfortable enough for him if he be let alone; he sets up earthworks and forts; he plans docks, builds and mans ships; and does it all often out of what he finds on the spot, taking everything as if it were his own, and fighting the owner if he dares to interfere; crushing out all that comes in his way, yet not quarrelsome if he is allowed his own way. When he has made a rough holding, he lets the Celt join him on terms which he keeps the key of, and the Celt, with light heart and elastic mind, beautifies the place and makes it more human, builds the temple, the theatre, the mansion, lays out the garden, introduces the picture, the sculpture, improves and lightens the literature, lets in the light, the art, the beauty; in fact, furnishes the place and makes it happy. When Saxon and Celt have in their ways thus installed the community in comfort and position, in glides the Jew with his money bags, and "will you buy, will you buy, will you buy," becomes the ring of the street and the market. So commerce completes the whole.

Dr. Richardson concluded by eulogising the Eisteddfod, showing its influence upon the Welsh people during the past thirteen centuries, and said that the love of Eisteddfod was a striking characteristic of the people.

## Hexham Abbey Church.

SIR,—Your sense of fairness will, I trust, excuse me for troubling you with this. I hope also that, as an old subscriber to your journal, you will permit me to ask you for the first time for a little space in it to protest against the outrageous language reported in your last number (August 19, page 115), as having been used by Mr. Peacock about the restoration of Hexham Abbey Church.

He is reported as saying that, "Before leaving the church, he thought the party ought to express their indignation and disgust at the ignorance and ruffianism of the architect who had carried out the work of restoration. They had never seen anything half so revolting as what they had seen to-day, and he thought that, considering the amount of destruction wrought, they should not go away without expressing their strong feeling."

We all know the abuse to which architects have been subjected of late years, but I fail to remember anything equal in the way of vituperation to the above. I may mention that in the winter of 1860-61 I spent many weeks in making drawings of the abbey, and sections full-size of nearly every moulding in the transepts, choir, &c., and therefore I had ample opportunity of observing what had been done by the late Mr. Salvin and the late Mr. John Dobson, of Newcastle, and certainly nothing had been done but what was necessary. In fact, even the most rabid member of any archaeological society, or even of the Society for the Preservation of Ancient Buildings, could not have a greater veneration for the works of past times than the architects just named had.

I visited the abbey five years since, and I found that the works carried out since my previous visit by Mr. R. J. Johnson, of Newcastle, were, it is needless to say, quite as notable as those of his predecessors for the obvious endeavour to treat tenderly the remains of the past.

I am, sir, your obedient servant,

THOS. FARRER, A.R.I.B.A.

44 Wellington Street, Regent's Park, N.W.

August 23, 1882.

## Appointment of Quantity Surveyors, Fulham Infirmary.

SIR,—We were greatly surprised and annoyed to observe a paragraph in the last issue of your professional contemporaries to the effect that we offered to take out these quantities for *half per cent.*

This statement is *utterly untrue*, as we studiously avoided making *any* offer; and even had we been obliged to do so we should have thought it *infra dig.* to make an offer so far below the recognised scale of charges usually made by surveyors of standing.

Messrs. Quilter & Hardcastle followed the same course as ourselves, and did not mention terms; and it is a significant fact (which, perhaps, may be a useful hint to those surveyors who offered their services at such low charges) that after the number of applicants had been reduced to six, Messrs. Quilter & Hardcastle and ourselves were the only applicants who obtained *any* votes, each firm receiving five votes, the former obtaining the appointment by the *casting* vote of the chairman.

We shall feel obliged if you will publish this letter in your next issue.

Yours &c.,

MAUGHAN & CUXSON.

7 Westminster Chambers, London, S.W.:

Aug. 23, 1882.

## St. Paul's New Church, Swindon, Competition.

SIR,—In answer to the advertisement of the above, I called on Mr. West, and I found that Mr. Ferrey had built the church, but Mr. West declined to tell me why Mr. Ferrey was not to do the chancel, &c., now required. I visited the church, and to me it seemed a charming work—simple, very inexpensive, and effective in the extreme. I had a short interview only with Mr. West, and I came to the conclusion that I should not be justified in going in for that competition. I daresay some of your readers will be glad of my experience. I remain, sir, yours faithfully,

9 Argyll Street, W. : Aug. 23, 1882.

J. VACHER.

**The Old Tunnel at Naples**, known as the Grotto of Posilippo, has just received a rival. On August 15 the boring of the tramway tunnel under Posilippo was completed. This tunnel, so far as height and width are concerned, is the largest in Europe, being 30 feet wide and 36 feet high. The steam tramway which is to run through it will be finished before the end of the year, bringing Naples into direct and easy communication with Pozzuoli. There will be also a broad promenade path extending through the whole length of the tunnel.

## NOTES ON NOVELTIES.

## Bellman's Patent Gully.

IN entering the region of sanitary appliances Messrs. Bellman & Ivey, of Wigmore Street, commence a somewhat "new departure" from the class of productions with which their names have been so intimately associated. Not that this *détour* is calculated to detract from the prestige of the firm; on the contrary it will give them an opportunity of gaining fresh *clat*, as the article of which we are about to treat possesses considerable merit. The "Bellman" gully, the invention of the senior partner in the firm, and of which we offer an illustration, is of stoneware, and intended to carry off the rain water from the house, as well as through waste pipes, disconnecting the whole from the building so far as any contamination from the drain may be likely to accrue. It will be seen that it consists of an oblong vessel, its size being 16 inches by 8½

inches, by 7 inches deep. Over the bottom opening communicating with the trap to the drain is placed a grating, to prevent any pieces or foreign matter that may have escaped from sinks, &c., from entering the drain, and as the top grating is loose and large enough to obtain full access to the gully, it can be easily and readily cleared at any moment. The water from the roof passing direct into the gully, prevents splashing, and to a certain extent this pipe acts as a ventilator to pipes and trap. But a most important advantage the "Bellman" gully can claim over most others is that, by using a "Por" strap, it can always be fixed at right angles, as the trap can of course be turned in any direction to meet the drain. Thus a perfect water-seal is always obtained, for should the weather be very dry, and a deficiency of rain-water occur, the constant influx of water from the waste-pipes of the household will effectually secure this against any amount of evaporation, and the constant changing of the water, so to speak, will keep it comparatively fresh. It will be seen that the appliance is of a most simple yet effective character, and it has already received high encomiums from influential quarters. As the price at which it is offered is merely nominal, we expect to hear that it will shortly be very extensively adopted. We may add that the firm also manufacture single gullies on the same principle for sink wastes only, which with ordinary care must always secure a clean and clear sink.

## CHURCH BUILDING AND RESTORATION.

**Clipstone.**—The memorial-stones of a Wesleyan Chapel have been laid. The building, which is to accommodate 120 persons, will be of brick with stone dressings. Mr. A. Eastwood, of Warsop, is the builder, and Mr. Arthur Marshall, of Nottingham, the architect.

**Maldenmoreton.**—The parish church of St. Edmund has been reopened after partial restoration. The work has been carried out by Messrs. Atwood & Sons, builders, of Brailes, Shipton-on-Stour, under the direction of Mr. J. Piers St. Aubyn, architect, of the Temple.

**Biggleswade.**—The dedication-stone has been laid of a new church at Biggleswade. The new building will be of white and red brick with stone dressings, and will have a south aisle. The nave is 73 feet 10 inches by 35 feet 10 inches, and the chancel dimensions are 20 feet 6 inches by 20 feet. A vestry and organ chamber are provided for. Mr. A. W. Blomfield, of London, is the architect; Messrs. Page Bros., of Buckden, Hunts, the contractors. The contract price is about 3,000*l*.

**West Haddon.**—The Baptist chapel has been reopened after works of renovation. The works include new seating and new tile-flooring, as also the addition of a narthex. Mr. E. Sharman, of Wellingborough, is the architect, under whom the work has been executed by Mr. E. Bassford, builder, of Northampton.

**Kirbymoorside.**—The ancient church of Gillamoor, situated in a romantic part of the North York Moore, has been reopened after restoration. The church has been refitted, the ceiling and walls panelled and decorated in colour-work, the chancel screen redecorated, and a new oak spire, lead-covered, has been erected in place of the old bell-turret, which has been removed. The church contains an old Norman font, and the inscriptions on the bells testify to its ancient foundation. The work has been carried out under the direction of Mr. Temple Moor, architect.

**Bognor.**—A new church, dedicated to St. John, has been opened at Bognor. The church is built chiefly of flint and red brick, and consists of chancel, nave, aisles, and transept. The nave is seated with chairs for 1,000 persons. The architect is Mr. Blomfield.

**Ashton.**—A new Wesleyan chapel is being erected at Ashton, near Preston. The chapel will afford accommodation for 250 worshippers, and have a minister's vestry, large classroom, heating chamber, and other offices situated at the west end. Local contractors are carrying out the various works from the plans and under the directions of Mr. David Grant, architect, of Preston.

**Chatham.**—An appeal is being made for funds for the erection of a new church at Luton, Chatham. It is proposed to provide a church with 750 sittings, and the directors of the London and County Banking Company have given a site for the purpose. A sum of 1,500*l*. has been promised up to the present, and there is also a conditional offer of 1,000*l*. subject to the church being built in eight years' time.

**Cwmbach.**—A new church, dedicated to St. Mary Magdalene, has been opened at Cwmbach, Aberdare. The church, which is seated for 300 persons, has been erected from the designs of Mr. E. M. B. Vaughan, A.R.I.B.A., of Cardiff, at a cost of 940*l*., by Mr. John Morgan, builder, of Aberdare. The church has been built in a simple Gothic style of architecture, on a site secured for 999 years. It consists of a nave and apsidal chancel, where the choir is seated. The walls are of Penrhiwceiber stone with Bath stone dressings. The roof inside is open timbered.

## SCHOOL BUILDINGS.

**Stratford-on-Avon.**—The report of Mr. Robson, architect to the London School Board, on the ten sets of plans sent in in competition for the new schools, has been forwarded to the Stratford School Board. Messrs. Giles & Brookhouse, of Derby, whose plans stood first, were disqualified by reason of condition No. 8 being ignored, which provided that the proposed extensions of the buildings should be indicated on the plans. The first premium was awarded to Messrs. T. E. Streatfield and W. O. Milne, of London; the second to E. J. Etwell, of West Bromwich; and the third to George H. Cox, of Birmingham. The Board decided to employ Messrs. Streatfield & Milne; the premium of 25*l*. to merge into commission.

**Falmouth.**—The foundation-stone of a Congregational Sunday-school at Falmouth has been laid. The building has two entrance folding-doors in the centre leading into separate vestibules, forming an entrance each for boys and girls. The main school is 50 feet by 42 feet, and is lighted by a large window over the entrances, and a similar one at the other end. A gallery runs round three sides, with three classrooms on either side, 9 feet by 8 feet, reached from the vestibules by staircases. Light is obtained by small windows in clerestory. Beneath the main school are three large classrooms and lavatory and cloakroom. In the basement is the infant school. The late Mr. W. J. Halligey was the architect. The contractors are Messrs. Mitchell & Kitto, of Falmouth.

**Sowerby Bridge.**—The memorial-stones have been laid of a new Wesleyan Sunday school. The building is being erected from the designs of Mr. C. F. L. Horsfall, of Lord Street, Halifax. It will consist chiefly of one large assembly-room, to accommodate 700 scholars. The principal approaches will be from Bolton Brow. There will also be a side door from which there will be direct access to the old school, which is to be divided into classrooms. The cost of the new school and the alterations of the old school is estimated at about 2,000*l*.—1,800*l*. being the cost of the buildings, and the other 200*l*. being for furnishing. The contracts for the school have been let for 1,659*l*. to the following:—Masons, Messrs. John Turner & Sons, Sowerby Bridge; joiners, Messrs. Halstead Bros., Eastwood; slater and plasterer, Mr. George Hoyle, Sowerby; plumbers and heating apparatus, Messrs. Wm. Fox & Son, Bolton Brow, Sowerby Bridge; painting, Messrs. E. Whitehead & Son, Sowerby Bridge.

## NEW BUILDINGS.

**Aberdeen.**—The Woodside Free Library, the gift of Sir John Anderson to his native town, which is on the point of completion, is designed in Early Scottish character and built of granite, the dressing being of Kemnay and the rest of the building of Rubislaw stones. Its extreme length is seventy-five feet, the width being twenty-five. The site secured measures upwards of a quarter of an acre, so that there is a large amount of space apart from the site occupied by the building, and this will be laid out in ornamental fashion. The contractors are Messrs. A. Mitchell & Co., masons; Messrs. J. Garvie & Sons, carpenters; Mr. James Bannochie, plasterer; Mr. G. Davidson, slater; Messrs. D. McHardy & Son, heating apparatus; Messrs. Mason & Son, painters; Mr. A. Cochrane, plumber. Mr. Arthur Clyne (Messrs. Pirie & Clyne, of Aberdeen) is the architect.

**The Tender of Mr. George Gunn,** Beith, amounting to 680*l*. 11*s*. 6*d*., has been accepted for the construction of two additional filters at Irvine Waterworks. N.B.

## GENERAL.

**An Art and Industrial Exhibition**, similar to the exhibition at Worcester, is proposed to be organised at Wolverhampton.

**The Electric Light** has been introduced experimentally in one of the departments at the Post Office, St. Martin's-le-Grand.

**The Autumn Exhibition** of the Royal Birmingham Society of Artists will open for private view to-day (Saturday).

**The Library, Lambeth Palace**, will be closed for the recess for six weeks from August 29.

**The Weigh-house Chapel** will, it is stated, be required to be taken in carrying out the completion of the Inner Circle Railway.

**The Manchester School** proposes to apply for authority to borrow 14,600*l.* for the erection of the central school in Deansgate, the contract for which has been taken by Messrs. W. Southern & Sons.

**The Deal Town Council** have obtained permission to remove Sandown Castle, a dilapidated ruin, to enable them to construct a sea-wall and promenade, extending past Sandown, for the protection of the land from the inroads of the sea.

**A Government Measure** is being prepared at Berlin to secure the preservation of monumental works of art and antiquities, particularly churches, castles, fortifications, ruins, and pre-historic remains, as well as pictures and coins.

**The Bromsgrove Board of Guardians** at their last meeting decided to advertise for competitive plans for a hospital to accommodate sixty-five patients.

**The Will of Mr. G. Somers Clarke**, architect, was proved on the 29th ult. by Mrs. Clarke, the widow, the value of the personal estate being over 10,000*l.*

**The "North-western Lumberman"** says that the rapid increase of population in Manitoba has stimulated the inventive geniuses of the Dominion to contrive houses that may be portable and quickly put up. L. Forest, of Bellville, Ont., has planned one that is in three-foot sections, and dovetails together. A house, for a hotel or boarding establishment, has been put up at Winnipeg, over 100 feet long, two storeys high, and divided into apartments sufficient to accommodate 250 guests. The foundation was laid on a Tuesday, and the house was completed on the Thursday afternoon following.

**A Spire**, designed by Messrs. Alexander & Rowlatt, architects, of Middlesbrough, is to be erected on the church of St. John in that town. Mr. T. Dickinson, of Saltburn, is the contractor for the work.

**The Cabins of the P. & O. Steamers** now on duty as hospital ships in Egyptian waters have been painted throughout with Griffiths' Enamel Paint, manufactured by Messrs. Griffiths, Berdoo & Co., 51 South John Street, Liverpool, and 34 Leadenhall Street, London.

**The Monmouthshire Antiquarian Society** made its annual excursion this year to Mathern, when visits were made to Mathern Church, Mathern Palace, and Morius Court. Morius Court, said to have been erected by Francis Godwin, Bishop of Llandaff, is remarkable for the large and beautiful gateway which leads to the courtyard. Over the gate are chambers in two storeys, and these are flanked by two high square towers.

**Excavations at Pompeii** have just brought to light a beautiful inlaid marble table, with reclining bed ornamented with paintings; a bronze vessel with revolving handle; two Egyptian statues, covered with a patina of green glass, which is very rarely found; a tortoise and frog in marble; a Bacchus in terra-cotta; two marble busts; and a skeleton with bronze hairpins beside it. There was also discovered a cavity in the lapilli, which, when filled with plaster, will, it is hoped, produce a figure.

**At Chesterfield**, where the "Brush" system of electric light has been adopted instead of gas, the streets, which are altogether nine miles in length, are illuminated by means of 22 arc lights and 98 incandescent lamps, all of which are supplied from one dynamo machine driven by one engine.

**The Geological Survey of Great Britain** is proceeding at so rapid a rate that it has been computed by Professor Ramsay that the mapping of the solid and superficial portions of England and Wales which still remain unsurveyed will be completed, on the scale of one inch to a mile, eighteen months from the present time; that of Ireland in six and a half years; and that of Scotland, to which seven surveyors are to be transferred on the completion of the English survey, in eleven years. The re-survey, however, for those portions of England and Wales which were originally only surveyed for their solid geology will then take, it is reckoned, about twenty years.

**The Imperial Life Office** will in future pay all claims on "proof of death and title," instead of on the expiry of the usual three months after proof of death has been given. This regulation will apply to all policies now in force.

**Messrs. Spottiswoode & Co.** are about to make extensive additions to their large printing works. The new extension will face Shoe Lane, and the work is to be carried out from the designs of Mr. H. Dawson.

**Mr. S. Mancey**, builder, was summoned, on Wednesday, August 16, to Worship Street Police Court, by Mr. A. Payne, District Surveyor of East Hackney (South) and North Bow, for constructing two houses in Hepscott Road, Hackney Wick, with mortar mixed with earthy matter. Samples of the material used in lieu of sand were shown in Court. Defendant's counsel at first denied that the material had been used, and called a surveyor who affirmed that the mortar was good; but subsequently one of the defendant's own witnesses admitted having mixed the mortar with materials similar to the specimen shown. The defendant was fined 60*s.*

**A Party of Belgian Architects**, sculptors, painters, archaeologists, and ecclesiastics, members of the Guild of St. Thomas and St. Luke, whose object is to promote the study of Christian art, have come over to England on a fortnight's tour, with the intention of visiting the principal ecclesiastical cities. Having arrived in Canterbury, they spent several hours in the cathedral, the Dean and the Bishop of Dover acting as cicerones. The party numbers nearly eighty, and includes Professor Reusens, of Louvain; Canon Delbigne, of Brussels; M. Van Henkelom, President of St. Bernulphus Guild, Utrecht; M. Jules Helvig, of Liège; and M. Blaneheart, of Ghaut. The other places to be visited by the travellers are Rochester, London, Winchester, and Oxford.

**Ashburton Church Restoration Committee** recently accepted the tender of Mr. Abley, of Salisbury, in the sum of 3,726*l.* for the restoration of the parish church, but Mr. Abley having since refused to carry out the work in sections as required by the committee, it has been decided to accept the tender of Mr. Foaden in 3,822*l.*

**A Correspondent** calls attention to the pedestal on which stands the model of the Wellington statue presented by the sculptor to the Royal United Service Institution—a pedestal of such pleasing proportions, and so good in its ornamentation, as to be well worthy of inspection and consideration at the present time.

**The Nottingham Corporation Act**, which last week received the royal assent, confers upon the Corporation the power of making additional bylaws relating to new buildings, and of making one general set of bylaws for the whole of the borough, various sets of bylaws in force having been left unrepealed when the different districts were incorporated in 1877.

**The Thirlmere Scheme.**—An arbitration, lasting nine days, has just been conducted at the Surveyors' Institution, Westminster, on the claim of the Countess Ossalinsky to compensation from the Corporation of Manchester for taking 3,357 acres of land for the purposes of their Act of 1878-9, for the supply of water from Lake Thirlmere to Manchester and district. The witnesses for the Countess put the value at between 70,000*l.* and 90,000*l.*, while those for the Corporation average about 25,000*l.* The valuers for the Countess claim 60 years' purchase and 50 years for compulsory sale on an increased rental; and the valuation for the Corporation is based on 30 years' purchase with 50 per cent. compulsory sale on the present rental. Mr. Huskisson has reserved his award, which will be given at the end of October.

**Ventilation of the Reform Club.**—Messrs. Robert Boyle & Son's system of ventilation has been adopted for the Reform Club by the committee and architects, and Messrs. Boyle have received instructions to proceed with the work at once.

**The Coalbrookdale Company, Limited**, have taken the premises Nos. 43 and 44 Holborn Viaduct, as London show-rooms for their manufactures, and they purpose to keep there a selection of the principal articles in grates, stoves, ranges, gates, railings, &c., made at their foundry. Mr. H. C. Eyres is the managing director.

**The Pavilion and Pier** at Southsea, Portsmouth, which were opened a few days ago by the Prince of Wales, have been painted with "Albissima Paint" by Messrs. W. Hill & Co., of Gosport, under the supervision of Messrs. Davis & Emanuel, architects, Finsbury Circus. The amount of Albissima used to cover the surface was a trifle more than half the quantity originally calculated.

**Mr. H. J. Thurgood (Thurgood & Co.)** writes that, having taken into partnership Mr. Howard Martin, late of the firm of Podmore & Martin, of Croydon, their offices will still continue to be at Lonsdale Chambers, Chancery Lane, and he style of the new firm will be Thurgood & Martin.

**The Site** for the new Council Chamber at the north-east corner of the Guildhall will shortly be entirely cleared. The building in which the Chamberlain's and Architect's offices were situate has been dismantled, and on the other side of the yard semi-demolished walls alone mark the position formerly occupied by the Town Clerk's offices. The new Council Chamber is to be of a duodecagonal shape, and in style will harmonise with that of the Guildhall and the Library. The diameter will be 54 feet. It will be surrounded by a corridor 9 feet wide, by means of which ready access will be obtained to every part of the Chamber. The cost will be about 35,000*l.*

# The Architect.

## THE PROTECTION OF ANCIENT MONUMENTS.

OW that the "Ancient Monuments Bill" has passed, and the idea has thus come to be established in England that the extant remains of the structures of our remote forefathers deserve to be preserved under the authority of the State, it may be not inappropriate if we indulge in a few reflections, not so much upon the present outcome

of so many years' generous agitation—scarcely a perfectly satisfactory result, many may say, after all—as upon the degree to which in future times it may be possible for the friends of antiquarianism to expect the genius of our political constitution to recognise the extension of the principle.

When we of the Western World smile at the ancestor-worship of such a nation as the Chinese, we seem to forget that advanced philosophy is sometimes inclined to smile in precisely the same way at our own practice of what is precisely the same weakness. There is this difference, it is true, between John Chinaman and John Bull—the one practically looks farther behind him than the other. Few Englishmen, especially those who happen to be going up in the world rather than down, are found to cherish so much sincere respect as they might for the memory of a grandfather; some are known to despise the reminiscences of even a more immediate progenitor; but when they are invited to go back five hundred years instead of fifty, and to penetrate far beyond the limits of personal relationship into the cloudland of national history, the love of patriots for their forefathers in general has no bounds; indeed, as a rule, the less that is known of the men of antiquity beyond their names, the more affectionately are they regarded. The great test of merit, in this as in all else amongst a practical people, is of course the glory of success—or of failure destined afterwards to become success; and inasmuch as every monumental spot in the land, whatever recollections of misery may be connected with it—the Tower of London, for instance—cannot but possess in like manner and to a corresponding extent its associations of triumph, it follows that there will be no ancient building which to the archæologist is not an object of interest, and to the casual wayfarer, if he have anything like a head on his shoulders, an occasion of wonder.

At the same time all this is obviously a matter of degree. We cannot possibly afford either the time, the temper, or the money to keep up everything that is recognised as old throughout such a country as England. Not only would the Society for the Protection of Ancient Buildings, whose militant proceedings have made so much noise at one time and another during recent years, be entitled to insist upon protecting, no matter at what sacrifice, all the worn-out edifices throughout the length and breadth of the land, but there would soon be found, by some one or other, attached to every farmer's field and every cross-road, every little hill and every little hollow, such genuine reminiscences of "the past" that the nation might as well give up once for all the interests of practical work, and live, like Mr. RUSKIN and some other too-brilliant enthusiasts, in the happiness of wholly imaginary scenes. What, then, shall be the definition of an Ancient Monument, in the sense of a relic worthy of absolute preservation by the State for the sake of patriotic feeling? Of course Sir JOHN LUBBOCK'S Act covers but a very small number of such remains. It will be quite fair for the archæological world, therefore, to take it as the thin end of a wedge. How much farther, then, may they hope to drive in this wedge in some future session of Parliament?

The state of things in the neighbouring country of France is a case in point. There the recognition of glory, national and personal, goes a good deal into detail, much more so than in England. The authority of the State also goes much farther into detail than with us. We will presume that it is with the cheerful consent of private proprietors as an act of patriotic duty, but when we see château after château in that fair and sprightly land dedicated to the service of "*les gloires de la France*," no doubt it is with an uncompromising assertiveness

of the paramount importance of those glories which, if it could be applied to the houses of our noble lords and jolly squires in England, would be enough to make them fancy the rights of property to be not a divine ordinance but a dream. To imagine, in a word, the ancestral hall of an English "county family," because of Queen ELIZABETH having slept in it or OLIVER CROMWELL'S Ironsides having turned it inside out, declared by authority from Whitehall to be a National Monument, not to be altered by its owner, or even kept in repair, except under the direction of the Council of the Royal Institute of British Architects, may be easy enough to a sufficiently enlightened Gaul, but could surely never come to appear in the most remote degree possible to a true Briton. It is this very condition of the British mind that has kept Sir JOHN LUBBOCK and his followers so long at arm's length. In the old slave-holding days of America the most popular of all arguments in favour of maintaining the "domestic institution"—and of maintaining it, of course, for ever—was the assertion of the principle that the obvious interests of ownership must always prove to be the best of all safeguards for the personal welfare of nigger property. So amongst ourselves the strongest opposition to the Ancient Monuments Bill has been the like assertion of the like principle, namely, that the owner of the interesting relic would naturally be its very best protector. The logic is good if it be assumed that every such owner is an earnest antiquary of easy fortune; but in so far as it is possible that he might occasionally be, as Lord BEACONSFIELD describes the type, a personage "devoted to field sports, who knows no language but his own, and never reads," it must be confessed that the logic is as bad as it was in the matter of the American negro. The preferable principle, in the one case as in the other, is that the public interest is best secured by public law.

But it is a pleasure to recognise what is unquestionably the fact in these days, that English people of all orders within the limits of moderately educated intelligence are amiably alive to the public interest which attaches to at least such ancient monuments as may have for the time a really important history. To preserve, *coûte que coûte*—what is merely old, and without adequate associations—a corrupt Georgian gallery interpolated in a Gothic church, a tottering chimney that was once struck by lightning, or a heath that was haunted by highwaymen—is more than any protective society in this paradise of societies could hope to persuade the private owner to do; but whenever the object in question is of true merit, there is that in the national character at the present day which can almost always be relied upon—and not at all for the sake of vainglory—to answer the challenge of rational antiquarianism. Were it not so, Sir JOHN LUBBOCK'S Act would be almost an affectation; but, looking at this general feeling as it exists, the enactment may be regarded as wholly practical and useful, if only as an authoritative indication of the patriotic spirit which for the future all good Englishmen who happen to be the custodians of such relics of history are to be expected on their honour to display. It is this view of the case, we venture to think, which alone gives to the measure its full importance and value; and we expect to see the effect of it gradually appearing in the extension, amongst English property-holders of all classes, of that feeling of personal pride, as distinguished from the mere sense of proprietorship, which is the truest safeguard of generous national feeling. However strictly we confine the application of the principle, the number of historical monuments in England must be very large—much larger, indeed, than any statute even in the future could possibly attempt to reach. It is the good feeling of private gentlemen, therefore, upon which, in almost every instance, the archæologist must depend; and, while he has reason for perfect confidence, it is due to the general character of English gentlemen that he should frankly and cordially make the acknowledgment.

The archæologist must also clearly bear in mind that his own functions are not exhausted when he merely demands consideration for his professional dicta; he has to educate his party, in fact to educate the whole public, up to his standard. He must also take care that this standard is a reasonable one; the public of this country will not support an affectation any more than an imposition; the one as much as the other is an offence to their common-sense. It is on this ground that we have to own with regret a certain want of confidence in the Society for the Protection of Ancient Buildings. We do not treat with any respect the argument that its operations are pragmatical; an occasional error in that direction must be

expected and excused, and after all is but matter of opinion. But we cannot help thinking its principles are so easily formulated in the abstract, whilst their application in practice is so difficult of anything like reduction to rule, that it is scarcely possible for such a tribunal to keep within bounds, even if it were not self-constituted as it is. What we venture to suggest is, the province being so wide, that the Society may be content to do less than enough rather than more. And, above all, the mode of doing, even when it is less than enough, ought to be carefully divested of three things—cant, rant, and ridicule. Poetic sentiment and literary humour are alike lost upon nine out of ten of the owners of our ancient monuments; straightforward common-sense and disinterested sincerity will go infinitely farther than refinements of learning or even affectations of grace.

#### FRANCOIS BOUCHER.

BOUCHER has been aptly designated as the incarnation of the French art of the eighteenth century. Essentially a Parisian, he was born in Paris, Rue de la Verrerie, 1703. He started in life at the period when *la jeunesse dorée* of France was weary of the gorgeous splendour and stately magnificence which for seventy years had characterised the reign of LOUIS XIV. The "style Louis Quinze," created to suit the altered tone of society, fascinated by its grace, its refined elegance, and its voluptuous charm. Its first exponents—WATTEAU, BOUCHER, FRAGONARD, PAJOU—were true artists; but, as remarks the author of "L'Art au XVIII. Siècle," it was doomed by the force of events to a *décadence délicieuse* and was lost in the whirlwind of revolution which swept over France, whence art emerged clad in the *chlamyde* of ATHENE, but severe, frigid, and unattractive, as the works of DAVID and his school attest.

BOUCHER's father was an artist unknown to fame. He had, however, sufficient knowledge of his profession to recognise in his boy a talent superior to his own. He took him to LEMOINE, then in the zenith of his fame. The great man with difficulty credited the fact that *The Judgment of Susannah*, which the father had brought with him, was really the work of a lad of seventeen, and at once received him among his students. *Hercule et Omphale*, now in the Las Cases Gallery of the Louvre, proves LEMOINE's capability to train a future BOUCHER. His style, derived from CORREGGIO, VERONESE, and BAROCCIO, but essentially French in its expression, was precisely that which BOUCHER's genius most naturally adopted; and his first composition, *The Birth and Death of Adonis*, proves how completely, before having formed a style of his own, he assimilated his work to that of his master. Were it not for the "F. B." on the vase in one of the paintings, and the evidence given by the engravings of these by AUBERT and SCOTIN, as well as the entry in LA LISE DE JULLY's catalogue, we would doubt their having been the production of LEMOINE's pupil. The same, judging by the engravings which alone remain to us, must have been the case with the *Cupid Reaping* and the *Cupid Bird-catching*. BOUCHER, however, late in life, assured MARIETTE that he spent but three months with LEMOINE. We scarcely credit this statement. It is certain, however, that when BOUCHER left the studio he was a finished artist and thoroughly imbued with LEMOINE's *technique*. To the end of his life BOUCHER spoke of his old master with reverence; and on one occasion, when a *virtuoso* showed him a picture by LEMOINE which had been lengthened to suit a special niche, BOUCHER remarked, with ill-concealed disgust, "To my idea such works are like the sacred amphora, on which I would not dare to lay a sacrilegious hand."

While lodging at LEMOINE's the lad had to find means of gaining his daily bread. CARL VANLOO had done portraits at so much the dozen, and had even turned scene painter; OUDRY had designed conundrums; BOUCHER found a patron among the clergy, and painted a whole host of pictures of saints and virgins for Notre Dame des Victoires, and even illustrated a breviary by designs of the Virtues. He maliciously painted these beneath views of various Paris streets, which evoked a satire from the Jansenists. That BOUCHER should illustrate a book of prayer was not more startling than that BAUDOIN, the caricaturist, should have been selected to illuminate the missal for the Royal Chapel at Versailles.

It was the age of illustration. The engraver DE CARS, employed young BOUCHER to design the frontispieces, trophies,

&c., with which it was the custom to adorn books of law, for which he paid the lad sixty francs a month, besides giving him his board and lodging. "This," MARIETTE writes, "he considered an immense piece of good fortune." It was at this period that DE CARS' lodger designed the vignettes for DANIEL'S "History of France," published 1721. It is evident that to DE CARS he owed his knowledge of engraving, and of the art of etching. On seeing an engraving of one of his own compositions by BOUCHER himself, M. DE JULIENNE entrusted him with the delicate task of engraving several of the drawings and sketches bequeathed by WATTEAU to his friend and patron, which difficult undertaking BOUCHER accomplished with inimitable skill, even surpassing in spirit and *maestria* his great rivals COCHIN, SYLVESTRE, and BASAN. M. DE JULIENNE, delighted and surprised by the rapidity as well as excellence of young BOUCHER's work, paid him at the rate of a sovereign a day. Of the 104 etchings of WATTEAU's drawings executed for M. DE JULIENNE by BOUCHER, the most remarkable are *Le Sommeil*, *Les Petits Buveurs de Lait*, *Le Petit Savoyard*, and *La Tourterelle mise en cage*. Of these there are four editions. BOUCHER executed at the same period *L'Andromède*, at which AVELINE also worked, and *Les Grâces au Tombeau de Watteau*, of which the best edition is the proof *avant lettre*, sold after the death of Baron DE VEZE. BOUCHER engraved eleven of his own works, twelve of BLOEMART's, and one of LOUTHERBOURG's, which, with those executed for M. DE JULIENNE, make a sum total of 182 engraved and etched works. While thus gaining his livelihood, BOUCHER found time for more congenial work. In 1724, at the age of twenty, he carried off the first prize bestowed by the Academy with his *Evil Merodach delivering Joachim from Captivity*. The Saturday following this event he was carried in triumph round the square of the Louvre on the shoulders of his fellow-students, an ancient custom fallen into disuse. They finally deposited him at the door of his own lodgings. The material advantages reaped from this success were not to be despised. BOUCHER was lodged, fed, and instructed for three years at the expense of Government, receiving, besides, an annual gift of 300 frs. He was subsequently sent to Rome. VLEUGHEL'S, Director of the French Academy at Rome, in writing to a friend thus alludes to his arrival there in June 1728: "Among others came one BOUCHER with VANLOO, a very promising young fellow, for whom I had difficulty in finding a room, and only succeeded in securing a *hole* in an adjoining house." On his return in November 1731 he was elected Associate of the Academy.

A century and a half ago news travelled slowly. The reputation the young student acquired at Rome had not reached Paris, and BOUCHER on his return to Paris accepted an order from a sculptor, DORBAY, who, having recently built a new house, was glad to discover a young artist in need of employment, and allowed him to paint his house from the ground-floor to the upper storey. One among the many exquisite compositions with which BOUCHER decorated it was the well-known *Enlèvement d'Europe*, which M. WATELET purchased at DORBAY's death. The sculptor ill repaid the work; but better days were in store for the rising genius, who had the singular luck to attract the attention of the Mæcenas of the day, Baron DE THIERS, son of the great financier CROZAT, whose splendid gallery, inherited by his grand-daughter, the Duchess of CHOISEUL, has been engraved, and was among the finest in the world. Baron DE THIERS had inherited his father's accurate taste and unerring judgment in matters of art, and built a mansion on the Place Louis XV., less for his own accommodation than for the reception of his art treasures. Once patronised by M. DE THIERS, BOUCHER's success was assured.

A keen lover of pleasure, young BOUCHER threw himself with all the ardour of his fiery nature into the dissipation of Paris life, but never allowed his enjoyment of a *partie fine* to interfere with his work. His love adventures were legion; he freely spent the gold he gained at his easel among his fair enslavers; but they were to him the amusement of an hour, and neither occupied his mind nor heart. He early wearied even of the charms of his first model, MORFIL—a girl of Irish extraction, whose original name was probably MURPHY—and turned his thoughts to matrimony, selecting a very lovely girl of seventeen, whose extraordinary beauty inspired one of his allegorical pictures. Having induced her to give him a sitting, he persuaded her to marry him. MARIE BUTEAU no sooner became Madame BOUCHER than she seriously commenced the study of her husband's profession, in this imitating

the example of the great majority of the wives of artists of that period. Madame BOUCHER acquired the art of engraving, and, besides, attained a considerable degree of success in painting reductions in miniature of several of her husband's works, which said reductions have been frequently sold as originals.

FRANÇOIS BOUCHER was elected Academician on January 30, 1731. His reception picture was *Renaud of Armide*, now in the Louvre. Since the year 1704 the annual exhibition of pictures had ceased to exist; but fortunate as BOUCHER's future career proved, by the many favourable circumstances which contributed to its success, he was most fortunate in the reopening of the Salon in 1731, for thus he obtained the opportunity of bringing his works before the public and securing a popularity which steadily increased as years advanced. BOUCHER's career from this period was one long triumph. The "Olympus," not of VIRGIL, but of OVID, supplied him with the series of allegorical subjects which laid the foundation of his fame. Perhaps a certain affinity between the genius of OVID and of BOUCHER might be traced in the poetry of the Latin writer and the paintings of the French artist. If a ballet was composed and acted at Rome on OVID's poem "L'Art d'Aimer," it was this very poem which inspired the finest creations of BOUCHER's pencil. "*La Volupté*," writes M. DE GONCOURT, "c'est l'idéal de BOUCHER." He never attempted to paint the soul. BOUCHER was a worshipper and unrivalled delineator of physical beauty. His Venus rising from the waves, surrounded by garlands of Amorini, is the most seductive creation ever put on canvas. The undulating outline of the figure is grace itself; the smile is enchanting; the colouring has a freshness all its own; the atmosphere is all sunny light, we are fascinated by the witchery and charm of the whole composition: whether inspired by its contemplation to loftier aims or nobler purposes, is another question. DIDEROT, the philosopher and encyclopædist, with something of the bluntness of old JOHNSON, thundered his anathemas at BOUCHER, but his was the sole dissentient voice. All Paris rang with his praises; he was the man of the epoch, and perfectly represented the spirit of the times. BOUCHER's type of beauty was never aristocratic; but, if lacking in distinction, it was always bewitching. There is a childlike loveliness, essentially fresh and youthful, which evidently was his ideal, for he constantly reproduces it. The oval of the face is somewhat shortened, the eyes are large and prominent, the nose is *retroussé*. The full red lips are parted with a smile as exquisite as that of one of MURILLO's angels. However little of the angelic may have existed in the original of BOUCHER's Venuses, she must have been captivating as a NINON DE L'ENCLOS. It is only in his charming illustrations of MOLIÈRE'S "Ecole des Femmes" and "Précieuses" BOUCHER aims at giving an intellectual expression; but graceful as are the grouping and composition of these, he fails to convey the idea of an elevated type of womanhood. When not engaged in depicting the goddesses of Olympus, BOUCHER portrayed scenes of pastoral life. In these his graceful fancy and fertile invention found endless scope. But with peasants as they really exist he had nothing in common. His shepherds are grand seigneurs in disguise. He evoked Celadons, Phillises, and Lycidases from the world of fable. His shepherdesses are women of the world in petticoats of rose satin, their exquisite feet encased in high-heeled shoes, their crook beribboned, their sheep freshly sheared. FONTENELLE wrote of BOUCHER's peasants, "It appears to me that their costume is too correct to be real." But if his personages in these pastoral scenes are Parisians in fancy costume, the landscape in which they are placed is Nature in her loveliest mood. BOUCHER was not a dreamer as was WATTEAU. He paints Nature in her brightest and most positive aspect. The torrent dashes over a rocky bed, the wind blows through the branches of an overhanging tree, birds fly across the sky, moss is growing over a ruined colonnade, saxifrage and wild vine entwine and climb from tree to tree, typifying an exuberance of life in Nature which BOUCHER depicts in the freshest tones palette ever produced. The word *fouillis* was literally created to express the wealth of foliage on tree, shrub, and plant he had the happy power of reproducing in harmonised confusion. His scenes are full of movement. His farm-houses are thatched, but birds have dropped the seeds of some wild plant which grows in luxuriance on the roof; on one side is a water-mill clumsily constructed of rough planks; a pigeon-house covered with moss is perched

above an old water-tank, worn by the knees of successive generations of washer girls; in the farmyard there is a litter of straw, a broken ladder, a wheelbarrow, a hen-coop; fowls are fighting, a dog is barking, children are running across the yard. If his scene lies on a country road, a cloud of dust is raised by the animals returning from the fair, the sheep are crowded into a narrow road, and one tries to push beyond the others; and the donkeys are laden with copper utensils bought at the market, which glitter in sunny light. As a landscapist BOUCHER's preoccupying thought is to fill his canvas with life, light, and movement. Even DIDEROT admits that no artist understood as BOUCHER "l'art de la lumière et des ombres."

(To be continued.)

## BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE members of this Association made an excursion on Wednesday, last week, to Dartmouth, performing the journey from Totnes by special steamer down the Dart. On the arrival of the party at Dartmouth a visit was first of all paid to the church of St. Saviour.

### Dartmouth.

Mr. Loftus Brock gave an account of the foundation and architectural features of the church. The west end corresponded with the date of the consecration of the church in 1372, while the east end was rather later, and belonged to the time of Sir John Hawley. The main walls were of earlier date, being apparently the shell of an older building. He called attention to the beautiful carved oak rood-screen, which was, he said, one of the glories of Devonshire churches. The famous carved stone pulpit had suffered mutilation at the time of the Reformation; the original sculptured figures had been destroyed, and replaced by the emblems and arms of Charles I. The fronts of the side galleries, dated 1816, were beautifully carved, their design following the same lines as that of the end gallery which belonged to the period of Charles I. Attention was also drawn to the altar-piece, a large painting, *The Raising of the Widow's Son*, dated 1818, by Brockdon, of Totnes; an artist, Mr. Brock thought, who deserved to be better known. The communion-table was pronounced unique, being supported at each corner by a figure of one of the Evangelists, the figure of St. Matthew at the north-west corner being shown as a double figure.

Some well-preserved brasses were described by Colonel Bramble. That of Sir John Hawley represented the knight with his two wives: Joan, whose hand he holds—a rather unusual feature—on one side, and Alice on the other. The brass was dated 1409, and was a good specimen of armour of the Camaille period, worn during the last twenty years of the fourteenth and first ten years of the fifteenth centuries. A second brass represented Gilbert Staplehill, Mayor of Dartmouth, robed in the gown which with more or less modification has come down to present days as the official mayoral garb. On leaving the church the interesting ornamental ironwork on the south door attracted notice; grotesque leopards are represented impaled on a tree, fashioned complete with roots, branches, and leaves.

The curious old houses in the Butterwalk and other parts of the town were next visited; some of the party went also to St. Petrock's Church, and the castle at the entrance to the harbour.

### Totnes.

A return having been made to Totnes, the visitors were, after luncheon, conducted by Mr. E. Windeatt to the East Gate, one of four original gates, two of which only remain. The East Gate, now much modernised, formerly consisted of two arched portals, one, with gates, for carriages, and a smaller one, "a needle's eye," for foot passengers. In the room over the gate a curiously-carved and coloured frieze was examined. Mr. Brock considered it was the work of a Flemish artist, though Mr. W. H. Cope was of opinion it was of Italian workmanship and origin; Mr. Windeatt, on the other hand, agreed with Mr. Brock, from the fact of the extensive dealings carried on by the merchants of Totnes in former days with Flanders.

### The Church of St. Mary.

Here Mr. Windeatt drew attention to the fact that the church was built of red sandstone, though no other building in the town or neighbourhood was built of that stone. The material was supposed to have been brought up the Dart from Stoke Gabriel, as several blocks of that stone had been found in the river in dredging. The manorial rights had been granted by the Conqueror to Judhael de Totnaïs, the Norman Baron, and the first notice of the existence of a church was found in that charter, "ecclesiam Sancte Marie de Toteneo," granted to the Benedictine Abbey of SS. Sergius and Bacchus at Angers. The church appeared to have been rebuilt in 1259, and again in 1432 by Bishop Lacy. Half-way up the fine old tower were three niches containing figures, the centre one being supposed to represent Bishop Lacy; under the figure is seen in raised letters, "I made the Tour." The church had been

recently restored under Sir Gilbert Scott, and Mr. Windeatt said he would leave the restoration to speak for itself. Before the restoration the beautiful stone pulpit had been covered over with paint to represent mahogany, and a wooden cornice had been put around it. One of the great objects of interest in the interior is the very handsome carved stone rood-screen under the chancel arch, with two parclose screens. It appears from some ancient documents that in 38 Henry VI. an order was made by the Corporation (who up to 1836 had control of the church), that the chancel should be divided from the church with freestone, as the Cathedral Church at Exon was.

Mr. Brock remarked that the church was a characteristic specimen of the ordinary Devonshire church, but above the average so far as its ornamentation was concerned. The window tracery generally, he believed, followed the old lines, but the east window was a modern production, although Sir Gilbert Scott prepared for it an admirable design. Having that day seen at Dartmouth the best oak screen in the county, they now saw the best stone screen in the county. With respect to the restoration of the church, its lines were excellent, but he rather complained of the removal of a monument from the chancel to the tower. He could often trace the history of a parish by little details which perhaps did not strike every eye, but all of which had their history, and to obliterate the later features of the church was to obliterate a certain portion of its history. Mr. Brock then took occasion to mention that there was in the north-east angle of the chancel outside a peculiar open arch. This arch was of much earlier date than the rest of the church, and was probably a portion of a much earlier building. Mr. Brock also suggested that the old lath and plaster baldachino, which stood in the chancel before the restoration, might have been put in front of the tower arch instead of being removed from the church. With regard to the rood screen and the stone entrance to it, near the altar, Sir James Picton, F.S.A., considered that the priest's doorway and staircase had been erected for an earlier rood loft than the present one, of which the beautiful screen alone existed.

#### The Guildhall.

The party were then received and hospitably entertained by the Mayor (Mr. E. Harris) and the Corporation in the neighbouring Guildhall. The Mayor remarked that Totnes was one of the most ancient boroughs of the kingdom, but as to the details of its history he must refer them to Mr. Windeatt, who was the antiquarian of Totnes.

Mr. Windeatt said the building was a portion of the old Priory of St. Mary, and proceeded to give a sketch of its history.

Mr. Brock suggested that if they took down the ceiling they would probably find a beautiful oak roof under it. The Corporation records were produced by Mr. Windeatt, who read quaint extracts from them; after which Mr. C. H. Compton added some remarks upon the ancient charters of the borough.

The Council chamber upstairs was inspected, and a further examination made of the deeds and charters. The party then proceeded to the castle, where Mr. Brock gave a short account of its history and the earliest probable use of the mound on which the keep was erected, and which he considered to be, as in other examples, such as Devizes, Restormel, &c., of ancient British work. He was of opinion that the early Norman lord of the town built only a wooden erection upon the mound, such as those depicted on the Bayeux tapestry, and that the wall of the present shell keep was of later date. He ascribed it to the twelfth or the earlier part of the thirteenth century.

The return journey to Plymouth was made at a late hour.

The proceedings of the Congress were resumed on Thursday at Lydford, the members having journeyed from Plymouth by special train to Tavistock, and thence on by carriage to Lydford, *via* Black Down, Mary Tavy, and Peter Tavy.

#### St. Petrock's Church, Lydford.

Mr. Brock, in the course of an address, said the building was one of great antiquity. The tower was altogether different from anything they had yet seen in Devon, and the plan was that of a very ancient building. Having examined the exterior, he found structural indications that the western part never formed a portion of the original building, and it was very possible that the original church consisted only of a simple nave and probably a small chancel. The western part was of the date of the south aisle itself. They had within the walls of this simple little building evidence of how the growth of the church must have commenced from small things. The tower was built some two feet away from where the old western wall formerly existed. On the north side there were evidences of the outside jamb, the coigns being visible. The builders of the tower—like wise men—erected it so that it would not interfere with the services of the church. The rough walling on the north side, where the original wall commenced, was extremely ancient. The font appeared to be of very early Norman date, but it was known by the researches of recent years that several fonts of Saxon date existed, not at all unlike the present one. The windows on the north side of the church were insertions of about the middle of the fourteenth century. To the whole of the

remainder of the church—the beautiful western wall and the south aisles—they might assign the middle of the fifteenth century. The tower was particularly interesting. It was built entirely of granite, and the work was massive and good. The dilapidated condition of the roof did not escape Mr. Brock's attention, and he suggested that it would give the custodians of the fabric some trouble before long. The principal ribs followed the lines of the barrel, and were carved with flowers, which were perceptible even now in the decayed state of the timber. Another curious ecclesiological feature was the rood loft, which was open all the way up to the point at which the priest emerged. Another feature seldom met with was the perceptible rise in the floor from the west end to the chancel stairs. Mr. Brock also noticed the massive blocks of granite used in the construction of the building.

#### Lydford Castle.

Under the guidance of Mr. Worth the party then repaired to the castle. Mr. Worth gave an historical sketch of the castle, and observed that there was no more suggestive site in Devonshire, because they had direct evidence in the earthworks that they were standing within the precincts of one of the great old forts of the Damnonii. The castle was surrounded on all sides by valleys. Lydford was of such importance in the Saxon times that a mint existed there, and there were in existence several specimens of pennies dating from Saxon times. Before Plymouth existed the Saxons came up and destroyed the mint. Whether Lydford itself was destroyed they had no evidence, but its inhabitants must have rapidly recovered themselves if it was, because, in the reign of Edward the Confessor, there was only one town which surpassed Lydford in importance, and that was Exeter. In Domesday Book they found it recorded on equal footing with the few great cities, and subject to taxation on the same conditions only as Exeter and London. It appeared to be a fair inference that Lydford lost its importance in connection with the Norman Conquest. After Exeter had given way it looked as though Lydford had stood out to the last and paid the penalty of its resistance. If that was so, he considered that Lydford in its decay was more to be honoured than many a city in its grandeur. Up to this date it was defended by earthworks, probably those of the original "hill fort" strengthened. The situation of Lydford was one of great capabilities—a tongue of land with deep ravines on two of its sides; a stout rampart drawn across the neck made it well defended, wellnigh impregnable. This portion of the earthworks could yet be traced, though their existence never seemed to have been suspected until three years ago, when they were discovered by the speaker. What did for the Saxon did not suffice for the Norman, and he reared the castle—a true keep—on an artificial mound of moderate height, with the base court on the north-west. The castle was mentioned as early as 1216, when it was granted to William Brieve. In all probability the fabric dated from the later part of the twelfth century, and formed one of the border fortresses by which the roads skirting Dartmoor were commanded. The building at various times had been much pulled about; still late Norman work was apparent on the south-east and north-east fronts. The entrance was on the north-west. The lower stage of the walls was in places eight feet thick. The area of the castle was entirely open to the sky, but divided by two partition walls into three apartments. Lydford sent members to the first Parliament of Edward I., but ceased to do so in the reign of Edward III. There was a Corporation and a Mayor, however, down to the middle of the last century, and the oldest and most grey-headed man in the place was always chosen coroner.

Mr. Brock said the castle was the only one of the kind in the district—a square keep distinctly Norman in plan, but not in his opinion affording distinct traces of Norman work—for the round-headed, splayed window openings enclosed square-headed slits; and the doorways were pointed. Nor could he see that it bore the marks of different periods. He was inclined to assign it, therefore, to the reign of King John, and to believe that in the main it was built as they saw it. No doubt, as there was a round mound, it had been preceded by a Saxon "strength."

The party then returned, after visiting the romantic gorge of the Lyd, over the moor to Tavistock. Brent Tor was passed *en route*, few, however, of the party ascending it to visit the church of St. Michael. A legend connected with the Tor records that the little fane owes its existence to the piety of a merchant who, in peril at sea, vowed to build a church on the first spot of land he saw; no sooner was the church built than the devil by night removed it from the foot of the hill to the summit, which lay in his dominions, but on the dedication of the building to St. Michael the enemy was sent flying down hill with a huge stone at his heels, which rock is still pointed out. The little edifice is only 32 feet long by 15 wide, with a tower 32 feet high, and for its size it is very massive. It is Early English in character, Mr. Hine identifying it with the church recorded to have existed here in 1283.

The members were entertained at the Bedford Hotel, Tavistock, for the Duke of Bedford, by the Rev. W. Tait.

#### Tavistock Church.

While inspecting this church Mr. Brock said that, by a record discovered in 1184, it was found that the fabric existed in 1134, and

was dedicated to St. Eustachius. It was rebuilt in 1318. As at St. Andrew's, Plymouth, the architecture fitted in very badly with the dates. The south aisle he took to be the aisle of St. Thomas A'Beckett. It was curious to find in the building occasional traces of the work of the fourteenth century. There was singular evidence that the church must have been all but remodelled a little later. The building itself exemplified all the points to which he had drawn attention as characteristic of Devonshire churches. There was no clerestory, there was the pointed barrel roof, the windows were broad and lofty. There was a chancel arch, which was a usual thing, and there was a western tower, which was a very unusual thing. At the east end they would see fragments of older work.

The Rev. Mr. Tait exhibited the registers and the curious old Cope chest found at the Bedford Hotel, with a Bible in its secret drawer. He said Devon was the fifth county into which printing was introduced, and it owed this distinction to the Tavistock Benedictines, who in 1525, or earlier, set up in their midst the eighth press that the kingdom had seen. Of two works still extant, the earlier gave the name of the printer as "Dan Thomas Rychard, monke of the sayd Monastery."

#### Tavistock Abbey.

The remains of this abbey were next inspected. This great Benedictine house was said to be of Saxon origin, going back to 961. It became eventually the leading monastery of the Benedictines in the West. It was destroyed about the year 1670, but far on into the last century important remains of the Abbey still existed, and the most extensive of these were cleared away for the erection of the Bedford Hotel. The noble church and chapter-house no longer existed, the chief remains being the refectory, now a Unitarian chapel, the still-house, the old walls of the Abbey, and the tower called Betsy Grimbal's, from a woman of that name having been murdered there many years ago. The tower contains a stone cistern, said to be a coffin. There is also a stone-vaulted chamber close by, called the "dairy," once the entrance to the refectory, and which still contains the arms of the Abbey on one of the bosses.

Mr. Brock, in conducting the party round the remains, traced the position of the missing portions. The lower part of the east gate was built of the locally notable volcanic ash of Hardwick about 1170, the upper portions of granite being of the 15th century. The two-storeyed tower-like building at the south-west corner of the Abbey was always known as the still-house. In the refectory, the original roof still remained, covered with a plaster ceiling, but the mouldings of the purlins and ornamental portions of the principal timbers which projected from the line of circular ribs had been cut away. Considerable attention was paid to the entrance to the refectory, with its groined stone ceiling. It has a chamber over, which was formerly approached by a circular stone staircase. This chamber had a handsome oak roof with trefoiled principals, now much decayed.

Mr. Rundle, the Duke of Bedford's surveyor, said he judged from excavations which had been made in front of the Bedford Hotel that the abbey church must have stood there. Encaustic tiles, forming portions of floor, had been found seven or eight feet below the present surface, and near the eastern end a large stone slab with an abbot's staff carved upon it, probably the top of a tomb. Fragments of white Beer stone, richly carved and resembling tabernacle work, had also been dug up. When old houses built about the middle of the seventeenth century had been taken down, blocks of stone, portions of cusped tracery, foliated capitals, and arched panelling had been found built into the walls, in style nearly all of them Early English or Middle Perpendicular. Tradition said the chapter-house stood where now was the present Bedford office. The outer walls were pulled down early last century for the sake of the materials, which it was said were used for erections now part of the hotel. Granite was extensively used for the pinnacles, windows, staircases, &c., of the abbey; but the bulk of the walls, all the square ashlar, much of the window tracery, carved capitals of columns and ribs, and filling of the groining, were of a compact trap ash stone, found about two miles from Tavistock. For the more delicate work in the interior of the church a white stone from Beer was extensively used, as was evidenced by the quantity of finely-carved work dug up or found embedded in walls of buildings. Some of these fragments were richly gilt and coloured. Little was known of the relations between the abbey and parish church, and a very complete series of the churchwardens' accounts from 1386 up to the end of the eighteenth century were unfortunately destroyed some years since. One entry contained receipts for offerings made to the ten altars in the church dedicated to the Virgin Mary, St. Thomas, St. Catherine, the Holy Trinity, St. Eustace (the patron saint), St. Blaise, St. George, St. John the Baptist, St. James, and St. Andrew.

At the evening meeting, which was held at the Athenæum, Plymouth, a paper on "Abbotskerswell Church" was read by Mr. J. Phillips, and another, on the "Antiquities of Plymouth," by Mr. Worth. In addition to these, papers on "The Associations of the Hoe" and "The Exeter Book" were contributed respectively by Mr. Bennett and Mr. Slater.

On Friday, Darlington Hall, the seat of Mr. Arthur Chamberlaine was visited from Totnes.

#### Darlington Hall.

The old hall is mentioned in Domesday as being held by Aldwin; in 1385 Richard II. granted it to Holland, Duke of Exeter. In 1587 it came into the hands of the Chamberlaine family, in whose hands it had remained since. Mr. Brock pointed out that the plan of the building was like most of the domestic houses of the period. It consisted of two quadrangles. The larger of the two, the remains of which still exist, had the domestic offices on both sides of it. The second quadrangle was smaller, and consisted of the best apartments. The work that remained was undoubtedly of the time of the rebuilding of the hall by John Holland, Duke of Exeter, the style being that of the transition from the Decorated to the Perpendicular. The mullioned and transomed windows in the tower were no doubt Elizabethan insertions; and the battlements and some of the corbels beside the tower were, he understood, rebuilt by Pugin some years ago. Proceeding into the great hall, the walls of which alone now remain standing, Mr. Brock said there was a fine open roof upon this hall at the commencement of the century, but as it was considered unsafe it was unfortunately taken down—a fact to be regretted, because an open roof of that early date would have been of great interest. The carved corbels—angels bearing shields—remained, and Mr. Brock also directed attention to the large open fireplace which marked the dais at one end of the room, and the three usual doors at the other end of the room, above which was the minstrels' gallery. Of the inner quadrangle, in part of which the house has been rebuilt, only fragments of masonry remain. No time was left to see the remains of the old church.

#### Berry Pomeroy Church.

This church was built, Mr. Windeatt surmised, about the latter part of the fifteenth century, by Sir R. Pomeroy, the south aisles being added by parishioners of importance, whose names were inscribed on the capitals of the columns. Mr. Windeatt called attention to the screen, and to the figures of saints in the lowest panels. These figures were discovered when, at the recent restoration, the old high pews, which were actually nailed to the screen, were removed.

Mr. Brock said the screen was a most beautiful work, and the small portion of colouring which remained showed how brilliant it must originally have been. The tower had a peculiarity he had not hitherto noticed in Devonshire, being "battered;" that was to say, it was broader at the base than at the summit. The recent restoration of the church was carried out by Mr. Medley Fulford, architect, and the execution of the work was much admired.

#### Berry Pomeroy Castle.

This castle, one of the most imposing ruins in the county, was also visited. Mr. Charles Lynam, of Stoke-upon-Trent, in giving a descriptive sketch of the ruins, said it appeared to be a matter of no uncertainty that a castle had been built there in Norman times, but no data existed from which its antique form could be learned. From the short inspection he had made he could venture on no definite opinion as to the time of the erection of the several parts. The gate-house, the wall between it and St. Margaret's Tower, this tower and the wall on the western side, were the oldest portions, and these did not appear to be earlier than fifteenth-century work. The utmost skill and care had been bestowed on the arrangement of the gate-house for its purpose of defence. A portcullis crossed the entrance—the side towers commanded it from the ground to the highest point, and commanded a view of every means of approach. Above the portcullis an opening was projected, whence missiles could be thrown below on the enemy. Nothing could exceed the skill displayed in the design of this part of the building, which, being the only entrance and standing against the higher ground, whence approach could have been the more easily made, was the weak point of the castle.

#### Compton Castle.

Compton Castle, which is ascribed as belonging to the middle of the fifteenth century, was hastily visited. Sir James Picton gave it as his opinion that it was a manor-house of the latter part of the fifteenth century, but that there was before that a castellated sort of building he entertained no doubt, although it was altered from time to time. There was no moat around it, and the defences were not such as were customary before the period to which he referred. The tracery of the chapel conformed exactly to this period. The style was of the Late Perpendicular.

A return was then made to Plymouth. At the evening meeting a paper by the Rev. Lach-Szyrma on the "Old Cornish Tongue" was read, a discussion on which closed the proceedings of the day.

On Saturday the members made excursions to Cornwood and Plympton. Slade Hall, the property of Mr. J. D. Pode, one of the Vice-Presidents of the Society, Cornwood Church, and Fardell House were visited. The latter is notable for the early years of Sir Walter Raleigh's life being spent there.

#### Slade Hall.

This is an extensive and somewhat modern-looking mansion. The visitors were received in the large hall, and Mr. Pode gave a

brief account of the building. Among the points of interest may be mentioned the "carved dado-work in the large hall and the ornamental roof. It is an arched collar beam roof, in design almost identical with that of the old Plymouth Priory, but believed to be 150 years older. Mr. Brock observed that the carving round the walls was almost precisely of the same pattern as that in the east gate of Totnes. The same flamboyant patterns predominated," the whole followed by a pretty canopy, which had been carved by no unskilful hand. The carving in the wainscoting was particularly beautiful, but it was not English work. Finding, therefore, some foreign work here and there, it may give rise to curious speculations as to its origin. He took it to belong to the fifteenth or sixteenth century, and the corncicing around the wainscoting to be the same as that of the arch itself, and the pretty arched roof which they had the gratification of looking at. The roof, which was a most beautiful one, belonged, he thought, to the time of James I.

#### Cornwood Church.

Mr. Brock in his remarks here pointed to the building as an instance in which the gradual development of plan could be traced from a building comparatively small to its present size. The nave would be the original form of the church, with addition of a western tower. While the tower still survived, nothing of the little nave remained. The tower was semi-Norman in character, the belfry windows being semicircular-headed, and the little tower arch pointed. The remainder of the building, like so many of the Devonshire churches, was Perpendicular. The flowing decorated windows in the walls were modern, like many other portions of the building. The pillars between the aisles and nave were of granite, one stone forming each shaft. Following the usual arrangements of Devonshire churches, the older parts were built of rag stone, and the later parts of granite. The building consisted of a central nave and two aisles, and there were marks of the addition of transepts about the same age, only separated from the rest by a few years. He said this because the transepts opened out not by return arches, but as a projection from the aisle itself—a better mode of arrangement. It gave the building all the appearance of a cruciform church. The present division of the nave and chancel by a timber roof and arch was not original. The original nave and chancel had no structural division except the screen. Mr. Brock was glad to see that the old sedilia and piscina were retained; they were of earlier date than the nave and the aisles, and suggested that the chancel was added to the older nave prior to the building of the aisles and nave existing.

Fardell House was next visited, and a paper read by Mr. Wright, the Congress secretary, in which he showed that Sir Walter was not born there, as many had supposed, because there was a letter extant in which Raleigh said he was born at East Budleigh. At Ivybridge the party took luncheon, and thence went on to Plympton, where Mr. Brooking Rowe took the party to the castle, and read a paper upon it. Other places of interest were also inspected, and a return to Plymouth was then made. In the evening the members, at the invitation of the Mayor of Plymouth, attended a conversazione at the Guildhall, where papers were read by Messrs. Cope, Hine, and Compton.

On Monday morning the members viewed some of the antiquities of Plymouth left uninspected on the previous Monday, under the guidance of Mr. Francis Brent. The citadel was the first point on the programme. Mount Batten, a curious old Martello tower, a work of Charles II., was also visited, and the members afterwards paid a visit to Port Elliott, the seat of Earl St. Germans, and Trematon Castle.

On the succeeding days various excursions devoted to pleasure closed the proceedings of the congress.

#### A PICTURE FROM POMPEII.

MR. E. N. ROLFE, writing from Naples, says:—An important painting has been found at Pompeii, and placed in the Naples Museum among the Pompeian frescoes. It represents the judgment of Solomon, and is the first picture on a sacred subject, the first fragment either of Judaism or Christianity, that has been discovered in the buried cities. The picture is 5½ feet long and 19 inches in height, and is surrounded by a black line about an inch in width. The scene is laid upon a terrace in front of a house adorned with creeping plants and shaded with a white awning. On a dais (represented as being about 4 feet high) sits the King, holding a sceptre and robed in white. On each side of him sits a councillor, and behind them six soldiers under arms. The King is represented as leaning over the front of the dais towards a woman in a green robe, who kneels before him with dishevelled hair and outstretched hands. In the centre of the court is a three-legged table, like a butcher's block, upon which lies an infant, who is held in a recumbent position, in spite of his struggles, by a woman wearing a turban. A soldier in armour, and wearing a helmet with a long red plume, holds the legs of the infant, and is about to cleave it in two with his falchion. A group of spectators completes the picture, which contains in all nineteen figures. The drawing is poor, but the colours are particularly bright, and the preservation

is excellent. As a work of art, it is below the average Pompeian standard, but it is full of spirit and drawn with great freedom. The bodies of the figures are dwarfed, and their heads (out of all proportion) large, which gives colour to the assertion that it was intended for a caricature directed against the Jews and their religion. This may be so, but my own impression is that the artist was anxious to develop the facial expression, and to do this, exaggerated the heads. There is nothing of the caricature about it in other respects—the agony of the kneeling mother, the attention of the listening king, and the triumph of the second woman, who gloats over the division of the child—are all manifest, and to my mind there is no attempt, intentionally, to burlesque the incident; but this is a matter of opinion.

#### WELLS AND WATER DISTRIBUTION.

A PAPER was contributed to the geographical section at the Congress of the British Association by Mr. P. de Tchihatchef, Member of the Academies of Sciences of Paris, Berlin, Munich, St. Petersburg, &c., entitled "The Deserts of Africa and Asia," from which the following is taken. Speaking of the province of Constantine, by the Sahara, he says:—

The wells constructed by the French engineers numbered at his last visit (1879), in the province of Constantine alone (and there are many elsewhere), more than 155; and as the works begun in 1856 have never been interrupted, and are rapidly advancing into the interior of the desert, the time may not be far off when all those regions, now so barren and so dry, will be copiously irrigated, an advantage which they certainly enjoyed once, seeing that the numerous oases spread over the Sahara and the Libyan deserts contain many remnants of Greek and Roman constructions; a proof that once they were populated and consequently provided with water. This was most probably got by means of the same so-called artesian wells which our modern times presume to consider as their own invention, whereas they were undoubtedly known to the ancients, and were even constructed in the very Desert of Sahara, as it is ascertained by Olympiodoros, a historian whose writings have perished, with the exception of a few fragments quoted by the Greek patriarch, Photius, one of which contains the following passage:—"In the oasis of Sahara the inhabitants used to scoop out excavations 100 feet and 250 feet deep, from which jets of pure water rise in high columns." But it was not in the Sahara alone that the ancients sunk artesian wells—they multiplied them almost everywhere; and to those artificial irrigations was due the once flourishing state of the plain, now so arid, which is covered by the ruins of Balbek (the ancient Heliopolis) and Palmyra. The English travellers, Wood and Darwins, discovered under those heaps of ruins numerous traces of ancient artesian wells; and such traces are frequent in the Arabian desert crossed by the Hebrews under the leadership of Moses. Since the invasion of the destructive Ottoman race all those monuments of ancient civilisation have disappeared, and it is the glorious task of France to make them revive once more in Algeria. Her exertions have been crowned with success, and really transformed this country in a most marvellous way; the creation of the admirable network of artesian wells established on a line of about 500 miles of length, and penetrating every day deeper in the desert, would be quite sufficient to secure to France a prominent place in the history of civilisation infinitely superior to that occupied by her most splendid conquerors. The subject suggests still many considerations, but I will limit myself to a word on the probable origin of the subterranean waters that feed these wells. In the Libyan desert, which is only the eastern continuation of the Sahara, Dr. Zittel is of opinion that between the oasis of Sirvah (the seat of the famous temple of Jupiter Ammon visited by Alexander the Great) and the Nile there is a large subterranean depression excavated in the impermeable clays and marls which compose the underground of the great part of the desert; the strata of the northern side of the depression dip to the south. Such natural subterranean water reservoir may exist equally in the Sahara, but so far nothing of that kind has been yet ascertained there, so that in the present state of our knowledge we are reduced to the supposition that the large subterranean water-sheds are chiefly produced by the rains in the mountainous country forming the northern boundary of the Sahara, and among which the Aurès range plays an important part. More probably the water furnished by those mountains (for in the Sahara itself rain is very rare) oozes through the different open crevices, joints, vaults, &c., and penetrate into the impermeable argillaceous strata.

No doubt the climatic changes ascertained in the Sahara-Libyan desert must suppose similar changes in the countries surrounding the Mediterranean basin, as, among others, Egypt, Syria, Asia Minor, &c. And that is really the fact, the arguments supporting it being as numerous as convincing. In his work on the climate of the Mediterranean countries, Theobald Fischer, after having studied the changes which they have undergone on that account during the historical periods, comes to the conclusion that such changes have not been very conspicuous in the regions of the northern shores of the basin, where the climatic modifications

pointed out in Asia Minor are considered by him as only local and exceptional phenomena, but that it is quite different in the regions situate on the southern shores of the Mediterranean, to the south of the 34th parallel, where rains, even in their normal state, are so inconsiderable that the smallest reduction of their amount is sufficient to alter the climate. Among the countries liable to such reductions, Theobald Fischer quotes Syria and Palestine, countries full of traces of ancient rivers and artificial irrigation, indicating a region once thickly populated, but which now is transformed into a dry desert, not only by the fault of men, but also in consequence of a complete change in the atmospheric conditions. Theobald Fischer points out equally the numerous deeply-excavated *wadi* in the whole of Africa, which doubtless represent so many beds of ancient rivers, in a time when rains were much more frequent than now. According to Theobald Fischer, the increase of the atmospheric dryness in North Africa is equally proved by the disappearance of the large mammals and the late introduction of the camel in those regions. This animal, for all communications now quite indispensable, seems to have been unknown in Africa almost until the Christian era, for no figure of it has hitherto been discovered on the monuments of Egypt and Meroë, and Polybius, speaking of the Carthaginian cavalry, mentions elephants, but never camels. In historical times North Africa was inhabited by the elephant and the rhinoceros, and what is still more significant, by crocodiles; for those amphibians suppose the existence of rivers not liable to be dried up. It is impossible to attribute the disappearance of all those animals only to the action of man; the less so as the countries where they have been mentioned were infinitely more populated than they actually are, and therefore offered to wild beasts a less favourable abode than now. We are consequently compelled to admit an alteration in the climatic conditions of the country—namely, an increase of atmospheric dryness, which may account for the late introduction of the camel in North Africa and Asia Minor, as well as for the disappearance of the elephants. In support of this opinion, Theobald Fischer reminds us that both in Asia and Africa the elephant excludes the camel, and *vice versa*; so that in the superior part of the valley of the Nile, where the elephant prospers, the camel thrives with difficulty. Dr. Oscar Fraas quotes equally the absence on the Egyptian monuments of any figure of the camel, and that not only in the famous ruined city Sagara, the walls of which are covered with pictorial representations of different animals, but also in Thebes, founded 3,000 years after Sagara.

This fact proves that at that time the desert did not exist; the presence of which is, moreover, excluded by the numerous splendid monuments, which certainly their constructors would not have built in the midst of inhospitable solitudes, no more than the Emperor Adrian would have erected near Rome the famous villa Adriana amidst marshes, had they existed then as now. Oscar Fraas is of opinion that in Egypt the climatic conditions were quite different from the present ones even in the time of the Greeks, when Alexandria was the brilliant focus of science and art, radiating her light on the whole world then known. He believes that the extraordinary intellectual activity which animated this city supposes another climate, a less dry air. "On the present soil of the Nile," says Oscar Fraas, "no philosophical system will be born, and no human power shall be able to erect there universities capable to cope with those of Europe." The conclusions suggested by Egypt are applicable in a still higher degree to the neighbouring peninsula of Sinai. When we consider that in this perfectly arid, waterless peninsula the people of Israel, counting 60,000 fighting men, remained, after the exodus from Egypt, several years, it becomes quite impossible not to admit that in those times Sinai was a fertile Alpine region, provided with rich pasture grounds and irrigated by copious sources; in no respect could such a country have the slightest resemblance to the barren desert it is now.

The few instances reported are sufficient to prove that the climate of the Sahara-Libyan desert, as well as that of the countries surrounding the Mediterranean, have really undergone important alterations, even during historical times. Now there are proofs that similar changes in the level of the ground and in the vegetation of these regions have equally taken place at a comparatively recent epoch. Gerhard Rohlfs, the well-known African explorer, has ascertained the sinking of the whole shore of Tripoli to the Gulf of Great Syrte; and, according to him, this sinking is so conspicuous that he was perfectly able to appreciate it during his repeated visits to the country. He quotes very remarkable instances of this phenomenon, and says:—"I do not think that anywhere on our globe such a rapid sinking of the soil has ever been observed." A quite opposite movement of the soil occurs on the neighbouring Tunisian shores. The bay of Porto Farina two centuries ago was considered as an excellent port, 30 to 50 feet deep, so that in the year 1655 Admiral Blake could very comfortably anchor there with his naval force, composed of nine men-of-war. At present the Porto Farina has hardly a depth of 2 feet, and the time is not far off when the whole bay will be joined to the continent. Again, the celebrated city of Utica, which, under the Carthaginians, possessed a splendid port, is now converted into a large sandy plain, and the ruins of the once littoral city are more than twelve miles distant from the sea.

There are few places in the world which offer a more melancholy contrast between the present and the past than this sandy, perfectly shadeless plain, which I crossed under the scorching African June sun, without meeting a single living creature of any kind. And still I became familiarised with similar impressions in the classic regions of Asia Minor, where not only men, but also nature, have for so many centuries practised the work of destruction. But if Nature destroys, she equally creates, and in a topographical sense Asia Minor offers, on that account, the most striking examples. During the ten years I devoted to the exploration of that magnificent country I was able—the ancient geographers and historians in my hand—to ascertain the modifications which the surface of this country has undergone, only since the Christian era. Those modifications are so considerable that, taking into account the increase of solid land produced by the formation of large river deltas and the filling up of seas and gulfs, it can be said, without exaggeration, that the surface of Asia Minor has conquered, during this comparatively short time, the amount of a little province; a kind of conquest which is still rapidly continuing, so that one day may be realised the prophecy of Strabo, who, eighteen centuries ago, declared that the time shall come when the shores of Cilicia may reach the island of Cyprus—an event likely to give great trouble to diplomatists, if such functionaries are then still existing.

#### ABBOTTSKERSWELL CHURCH.

THIS was the title of a paper read at the meeting of the British Archaeological Association by Mr. Phillips, from which the following is an extract:—

The earliest mention on record of this parish is in a cartulary of Sherborne, whereby it appears that in the year A.D. 956 the manor was granted by Eadwig, otherwise King Edwig the Fair, to a lady named Edelhild. This lady, elsewhere called Ethilda, the daughter of Edward the Elder, and half-sister of Athelstane, married in the year 926 Hugh Capet, Count of Paris, and founder of the Capetian Dynasty of France. The manor of Abbottskerswell being conveyed to the lady Edelhild, it is a probable assumption that this was the period of the founding of the church. In 1316 to "Abbotdescarswell" were annexed the hamlets of Eggeswill (now Edginswell, in Mary Church) and of Cockington. And two years later a royal licence was granted to the Abbot of Sherborne to "let to farm" the manor of Carswill for the term of ten years. This accession of property and licence to lease appear to point to a period when an effort was made to raise funds for some special purpose, and since the architecture of the present edifice points to this period as the time of its erection, it is a fair deduction that for these special purposes these extra grants of land were made; and hence we look to the Abbot of Sherborne as the builder of the church as it now stands. In the course of the recent examination of the church for the purpose of restoration, there was discovered, beneath plaster and whitewash, a much mutilated figure or effigy, offering various points of interest and speculation as to its purport and date. For this latter, and comparing it with others, it may pass as cotemporary with the latter portion of the church, and a most singularly graceful and accomplished piece of sculpture it has evidently been. In height it stands about seven feet. It is completely hollowed out at the back, so that there is now probably nowhere more than a thickness of four inches. The stone may be Purbeck freestone, but I also think it is not unlike that which is raised near Amiens, on the line to Paris. The head has been encircled by a sculptured crown, with a fillet, in which are ornaments representing precious stones. From beneath the crown fall massive tresses of hair, brought out with unusual elaboration in the sculpture; also from beneath the crown depends a veil at the back. The robe falls in folds to the ground, and has been elaborately decorated, both in a light and also in a black pigment. The sculptured crown of the head has been for the most part cut away; two complete details alone remain, and which, though not unfamiliar, I have yet been unable to identify. A gentleman in the British Museum, to whom I sent a sketch, can only compare it to the crown of Richard Cœur de Lion in the Cathedral of Rouen. The present position of the figure is puzzling. It has been suggested that it was brought from some larger and more important church to be hidden from the eye of the despoiler. This appears to me most far-fetched, being placed in the angle of the south window of the chancel. There is no name connected with the early history of this church, nor with the parish, of any distinction beyond that of the Lady Edelhild. It is suggested, then, as a fair presumption, that at the rebuilding of the church by the abbot and monks of Sherborne, to whom the history of the Lady Edelhild must have been familiar—as the first mention of the parish is in a cartulary of their abbey, and concerning whom they probably had more information than has reached us—they desired to commemorate the munificence of the royal lady who founded the church, which had become one of their benefactions.

A Memorial to the poet Longfellow is proposed to be erected in Westminster Abbey. Among the names on the committee is that of Sir Frederick Leighton.

## NOTES AND COMMENTS.

THE bye-laws of the Lincoln Urban Sanitary Authority appear, as far as building regulations are concerned, to have been for some time a dead letter, the rule being seemingly to violate rather than observe them. Several persons have lately been summoned before the Lincoln City Police-court for infringement of certain of the bye-laws—laws in one or two cases specially necessary—framed as a precaution against the spread of fire. The parties summoned have in the present instance been let off with the imposition of a small fine, as the cases were mainly brought into court to secure the observance of the bye-laws, the deputy town-clerk observing that he had a long list of other offenders, and that if all the houses which had been erected within the last eighteen months were inspected, in no instance would it be found that the bye-laws had been complied with. No doubt those who engage in building operations for the future will hesitate to follow the example of such who have hitherto, when warned, been pleased to content themselves with refusing to carry out the bye-laws.

THE appeal which we noted last week, pointing out the desirability of the preservation of the "Druids' Circle" at Turton, near Bolton, proves to have been made too late for any practical purpose as far as these ancient remains are concerned. As matter of fact, the "Druids' Circle" is a thing of the past in every sense of the word; it no longer exists. Some gentlemen in Bolton have just paid a visit to the spot, "when," as they say, "to our deep regret and utter disgust, we found that the vandalism of some uncivilised being had razed every stone in the circle to the level of the ground."

WHEN parishioners desire to furnish bells for their parish church it is usually supposed that provision has been or is to be made for their reception. Something like a little oversight in this respect seems to have been committed by persons interested in Earl's Barton Church, which by the way has both tower and bells. The bells are, however, in a dangerous state, and are liable to fall or crack at any time, according to the report made on their condition. Mr. TAYLOR was in consequence asked to send an estimate for their restoration, and a notice was posted on the church door that a collection for the necessary funds would be made at the evening service. But by the evening the notice had disappeared, and the vicar informed the congregation that such a notice could not be posted without the signature of the vicar of the parish, and added that Mr. CARPENTER, the architect for the restoration of the church, deemed the vibration of ringing the bells would be dangerous till the tower itself was rendered secure—the moral being that the repair of the tower must precede the restoration of the bells. This, however, was not quite all: the enlargement of the school, the vicar said, would have to precede all else, and no collection could be made for the bells. The promoters of the scheme, notwithstanding, collected nearly 2*l*. for the purpose as the congregation left the church.

A NEW room has been opened to the public at the Exhibition of Decorative Art in the Palais de l'Industrie. The Paris exhibits it contains are illustrative of the history of costumes and art of clothing, and include the fine collection of engravings sent by M. VICTORIEN SARDOU, who has himself compiled the catalogue.

THE St. Petersburg municipal authorities, moved thereto by the ever-increasing number and destructiveness of fires in that city, are engaged in erecting several buildings of different types, upon which experiments will be made with a view to discovering the form and mode of construction best adapted for resisting the destroying element.

THE arbitration jury appointed to award compensation to householders and tenants for the alterations necessitated by the raising of the level of the Marbœuf quarter of Paris has just terminated its task. To the owners of houses they have allotted 10,801,000 francs instead of 4,634,660 francs offered by the municipal authorities, and to the *locataires* 4,801,041 francs instead of 1,542,516 francs. These awards afford a fresh and striking proof of the enormous rise that has lately taken place in the value of Paris property, for it is said that the offers of the city were founded upon the assessment value only ten years ago.

AT the last meeting of the Académie des Inscriptions et Belles-Lettres, Paris, Mr. EGGER communicated a paper by M. MELETOPONLO, a well-known antiquarian of Athens, describing and explaining a Greek inscription lately found near Zea, on the western side of the Piræus. This inscription, of which all but fifteen of the characters are intact, covers ninety-seven lines, and has been exactly reproduced by photography for M. MELETOPONLO's work: it dates from the fourth century before the Christian era, and contains the contract and plan of execution of the naval arsenal constructed by the architect PHILON of Eleusis, and considered by STRABO as one of the greatest architectural masterpieces of the epoch.

THE Canadians have paid the British Association the compliment of asking them to hold their next annual meeting in the Dominion. Invitations were likewise forthcoming from the towns of Birmingham and Southport. When the matter was formally taken into consideration the deliberations resulted in choosing between Canada and Southport, the votes being ultimately given in favour of holding the annual meeting for 1883 at Southport. A question incidentally arose during the proceedings as to whether a visit to Canada could be considered to come within the general scope of the Association, but the fact of choice being finally made between an English town and Canada apparently disposes of that question in an affirmative sense. The meeting has been fixed for September 19, 1883.

M. PAUL MANTZ, the Director of Fine Arts, Paris, is setting an example that might be followed to advantage in every public office in the world. Immediately on his appointment to the post he gave instructions for the clearing out of all the pigeon-holes and document-boxes of the department. Their contents, which have been accumulating during the past ten years, and consist of reports from special commissions, projects and plans of every sort, are to be carefully examined, endorsed, and classed, after which M. MANTZ will himself go over them and dictate the required decisions and replies.

IN the report of the Survey of Eastern Palestine, submitted at the meeting of the British Association, it is noted that Captain CONDER accompanied the Princes EDWARD and GEORGE OF WALES on a tour in Palestine, which lasted six weeks, in the course of which the Mosque of Hebron was visited, and an accurate plan taken by Captain CONDER. The results of the work so far have been, among other things, the discovery of a vast number of cromlechs and rude stone monuments, and Captain CONDER has established the fact that this part of Moab was a great centre of the form of religious worship of which these monuments are the remains. He suggests that among them are the altars of Balak. He has proposed identifications for Baal Peor, the Field of Zophim, the Ascent of Luhith, Jazer, Sibmah, and Minnith—six biblical places previously unknown; he has collected a great quantity of Arab folklore, with tribe marks and traditions; he has found a most remarkable building of Persian character at Ammân; and he has made a collection of sketches and plans of the greatest value.

ACCORDING to the *Chronique des Arts*, during the month of June last M. MASPERO, the successor of the famous MARIETTE BEY as director of the Boulocq Museum at Cairo, succeeded in obtaining from the Egyptian Government a small credit for fitting up the new galleries constructed during the past winter. The various objects which have hitherto encumbered the museum have been arranged in their new quarters, among the new exhibits being the celebrated PHARAOH mummies discovered last year among the ruins of Thebes.

ON July 8 M. MASPERO received a pressing invitation from the French Consul to join a special train that was about to transport a number of Europeans from Cairo to Ismailia. At first he refused to leave, and steadfastly continued his work of arrangement and classification at the museum; a week later, however, an imperative order arrived, and with great reluctance he was compelled to abandon his precious collections. The museum is closed, doors, windows, &c., being carefully fastened, and the building confided to the care of two native employés, upon whose fidelity and courage the director believes he can safely count.

AGRICULTURE, DECORATIVE FRIEZE: POTTERY.

DESIGN FOR A CLUB.

A SLIGHT description only is all that is required to supplement this design, which otherwise explains itself. First of all, the aim was to place the whole range of the two principal rooms towards the main street, with the library well to the back of the building, to avoid noise and the direct rays of the sun. On the first floor are the coffee-room and visitors' coffee-room (over morning-room), house dining-room, library, serving-room, and stores. The next floor contains secretary's offices, facing the principal staircase. On the left are situated bed, dressing, and bath rooms for residents; while on the right are two billiard-rooms, card-room, serving-room, store, lavatories, &c. The third floor is given up to men's and maids' bedrooms. Under the ground-floor and above the basement is a mezzanine containing ten bath and dressing-rooms, also large lavatories, water-closets, &c.; the remainder is occupied by housekeeper's room and stores, steward's room, general wine-cellar, and china store. The basement contains a kitchen, 36 feet by 24 feet, and scullery, 26 feet by 20 feet (each of these rooms are 20 feet high), men's sitting-room, maids' sitting-room, servants' hall, butler's pantry and bedroom, special wine-cellar connected with general wine-cellar in mezzanine, heating chamber, and the usual multitude of offices necessary to a large household.

EDWIN G. HARDY.

## THE BRITISH ASSOCIATION.

THE following abstracts of some of the papers read at the meeting of this Association may be of interest:—

Mr. B. Baker, in a paper on the Forth Bridge undertaking, gave Sir Thomas Bouch the credit of the bold proposition to cross the Forth in two spans of 1,600 feet, and so avoid the necessity of intermediate piers in unprecedented depths of water. That structure, however, was abandoned after the disaster to the Tay Bridge. Mr. Fowler submitted a project for a bridge on the continuous girder principle, and an Act had been obtained for constructing such a bridge, having two spans of 1,700 feet, two of 675 feet, fourteen of 168 feet, and six of 50 feet, with a clear headway of 150 feet above high-water spring tides. Not only would such a bridge prove stiffer than a suspension bridge, but it would also be cheaper. Steel was to be used in the construction of the bridge. No punching or shearing would be allowed, and all holes drilled through the whole thickness of plates and angles after being put together. The effect of wind-pressure on the superstructure had been carefully guarded against, and he thought it might be said the bridge would withstand the strongest hurricane yet known. The total length of the great continuous girder was 5,330 feet, or say a mile, and the viaduct approaches 2,754 feet, or rather over half a mile. The heaviest train traversing the bridge would not deflect the 1,700 feet girder more than four inches, while a wind pressure equivalent to 30 lbs. per square foot over the entire 1,700 feet would bend the bridge laterally less than nine inches. About 42,000 tons of steel would be used in the superstructure of the main spans, and 3,000 tons of wrought iron in that of the viaduct approach. The total quantity of masonry in the piers and foundations would be about 125,000 cubic yards, and the estimated cost of the bridge 1,500,000*l.*

A report of the Committee on Wind Pressure, which was read, stated that the total pressure on small plane surfaces due to actual winds in high and exposed positions had to a great extent been ascertained with sufficient accuracy for engineering purposes. It must be assumed, for the present at least, that for engineering purposes pressures of 80 lbs. or even 90 lbs. per square foot on surfaces had been correctly recorded in extremely exposed positions, such as the Bidstone Observatory, while pressures approaching the limit prescribed by the Board of Trade, 56 lbs. per square foot, might possibly act on engineering structures in exposed positions. As in the design of marine works the depth of water and the length of fetch enabled some estimate to be made of the strength of structure required to withstand the heaviest seas to which they might be exposed, so a careful comparison of the wind pressure observed during the height of a gale at various stations where anemometers existed would enable some estimate of the relative exposure of similar places to be made. Exceptionally high gusts of short duration should be excluded from the comparison as being probably limited in area.

Mr. J. Clarke Hawkshaw, after describing the history of the Channel Tunnel movement, said the best line for the Channel Tunnel was but one of many factors to be taken into account. The Folkestone route would sacrifice all those of known value for the one of which the value was the least certain. No tunnel could ever be driven under the Channel without meeting with some water, and an attempt to make one without ample preparations for dealing with a large quantity of water would only lead to

waste of money, and perhaps failure. The advantages to be obtained by making the tunnel in a direct line from Fanhole to Sandgate were the following:—The shortest sea tunnel; as short a land tunnel as by any line; a greater thickness of chalk through which to tunnel the best termination for effecting junctions with the existing English railways; and a termination affording facilities for defence at a less cost than elsewhere. No certain advantage could be claimed for the Folkestone route, and as compared with the route to the east of Dover it laboured under the following disadvantages: The sea tunnel must be at least three miles longer; the land tunnel must be four miles longer, unless the mouth was placed in the Folkestone landslip; the chalk on the line of tunnel would be only half the thickness—in round numbers, 250 feet, against 500 feet; it would emerge near no fortifications; nor could it be connected with the London, Chatham, and Dover line at Dover. Further, the tunnel must be made for a great part of its length near the outcrop of the chalk on the sea-bed, which should be avoided. One of the requirements to be fulfilled by the tunnel was that it should be so designed as to be capable of being worked by ordinary locomotives. That, of course, would necessitate artificial ventilation, but in a tunnel in a direct line between Fanhole and Sandgate he believed 500 effective horse-power would be sufficient to carry on the ventilation.

Mr. Boyd Dawkins, treating this subject from a geological point of view, said, the general conclusions to which he had come were that the lower beds of chalk marl and the lower part of the gray chalk were only strata in the chalk sufficiently impervious to allow of the construction of a tunnel in the dry; secondly, that the outcrop or grey chalk and chalk marl between Folkestone and the Shakespere Cliff was the best position for a tunnel, which could strike the lower part and remain in it throughout, so as to join the working of the French Channel Tunnel Company; thirdly, that the fault in the lower part of the gray chalk did not allow of free percolation of water and was not likely to become a serious obstacle to the work; fourthly, that the strata above the gray chalk and marl were so porous and traversed by open fissures that they allowed of the free access to water, both subaërial and marine, and therefore offered great difficulties in the way of the construction of a submarine tunnel which were not presented by the lower beds of the gray chalk.

Sir John Hawkshaw remarked, in the discussion that followed, that the water held by solid chalk was of no sort of consequence to the engineer. It would not affect the question of the tunnel at all. The only thing that would affect it would be water running along free fissures. Professor Prestwich pointed out that one difficulty which had been suggested was that the chalk might be penetrated by sand or gravel pipes, which descended from the surface to depths of 70, 80, and probably sometimes 100 feet, and carried down a large quantity of surface water. If one of those pipes were met with in traversing the Channel it would probably prove fatal to the progress of the work; but it was impossible that those pipes could reach to the depth at which the tunnel would be carried. Sir F. Bramwell said there was good evidence to show that the boring would be practically watertight throughout its whole length.

Mr. J. Fowler, on the subject of railways, said that an essential condition of the attainment of high speed on a railway is that the stopping places be few and far between. On the Metropolitan Railway no sooner has a train acquired a reasonable speed than the brakes have to be sharply applied to pull it up again. Sixty per cent. of the whole power exerted by the engine is absorbed by the brakes. In other words, with a consumption of 30 lbs. of coal per train mile, no less than 18 lbs. are expended in grinding away the brake blocks, and only the remaining 12 lbs. in doing the useful work of overcoming friction and atmospheric resistances. Comparatively high speed and economy of working might be attained on a railway with stations at half-mile intervals if it were possible to arrange the gradients so that each station should be on the summit of a hill. An ideal railway would have gradients of about one in twenty falling each way from the stations, with a piece of horizontal connecting them. With such gradients gravity alone would give an accelerating velocity to the departing train at the rate of one mile per hour for every second; that is to say, in half a minute the train would have acquired a velocity of thirty miles an hour, while the speed of the approaching train would be correspondingly retarded, without the grinding away of brake blocks. Could such an undulating railway be carried out, the consumption of fuel would probably not exceed one-half of that on a dead level railway, while the mean speed would be one-half greater.

Dr. Fleeming read a paper on Recent Progress in Electric Railways, and described Edison's railway at Menlo Park. Having said that Edison's method saved about 1 lb. of coal per hour per horse-power over the ordinary locomotive, Mr. Fowler, the president of the section, disputed this statement on the ground that Dr. Fleeming had assumed a consumption of 6 lb. of coal per horse-power per hour in the ordinary locomotive, whereas that was nearly twice the amount actually consumed; and Professor Forbes doubted that the alleged efficiency of the electric locomotive was as stated—90 per cent.—because no account had been taken of the internal resistance of the dynamo. Mr. Traill, who is at present engaged in constructing the largest electric railway in Europe—

namely, a seven-miles line in the north of Ireland—considered that the great advantage of the electric railway was the possibility of developing electricity from stationary steam engines, by which cheaper coal might be employed. In reply, Dr. Fleeming said that his figures respecting the consumption of coal in the locomotive had reference to the work of the ordinary locomotive.

Sir F. Bramwell gave a description of a self-contained tramcar, worked by compressed air, which is at present running from Doulon to Chantonay, by the river Loire at Nantes, and which is about to be introduced experimentally under his superintendence on the London tramway system. For the purpose of securing the necessary power to work the car on ascents on the tramway line there are certain air reservoirs, from which a reserve of highly-compressed air may be turned on at a moment's notice. The compressed air is pumped into the reservoirs at the terminal stations. Each car weighs  $6\frac{1}{2}$  tons unloaded, and is seated for nineteen passengers inside and fifteen outside. The air is compressed to thirty atmospheres above the ordinary atmospheric pressure. The consumption of fuel required to work a portion of the machinery on the car is about 12 lbs. per mile. The system worked admirably at Nantes.

Mr. F. J. Sprague, of the United States navy, in a paper on Edison's system, described all the details of that mode of electric lighting. On the subject of safety arrangements, he said that much had been heard about the dangers of fire from the introduction of electricity, but if the wires were properly laid, and means taken to cut out a circuit when for any reason there was an increase of current, there was no cause for apprehension. Edison had introduced, besides other precautions, a weak point in every main, divided, and subdivided circuit. This weak point was a bit of wire of lead and tin alloy, mounted in a plug and readily replaced when destroyed. In the event of danger the sudden increase of current fused this wire before it could possibly heat the copper conductors. He thought with Mr. Edison that storage batteries were not a necessary adjunct, and that with a large system of distribution by multiple and branch circuits the variation of light would be remarkably small, and failure in the street mains was practically impossible.

Mr. C. E. de Rance read the report of a committee of investigation into the circulation of the underground waters in the permeable formations of England, and the quality and quantity of the water supplied to various towns and districts from those formations; to which was added an appendix by Mr. Edward Wethered, on the density and porosity of rocks in relation to the water supply, in which the author set out by averring that a knowledge of the porosity of rocks was important as regarded the water supply, the suitability of stone for building purposes, and in accounting for some of the lithological changes often observed in the earth's strata. The vast volume of water stored in the rocks had not been fully realised. The density of the old red sandstone was 2.61, the volume of water absorbed by a cubic foot being 0.707 gallon, and by a square mile, 3 feet thick, 59,000,000 gallons. The conglomerate beds of the same formation were still more absorbent, being capable of taking in 0.805 per cubic foot, or 67,000,000 gallons to the square mile, 3 feet thick. The mill-stone grit which lay at the base of the coal measures varied much in different localities, that found in the Forest of Dean being the most porous, absorbing 66,000,000 gallons to the square mile, 3 feet thick. Some of the coal-measure grits also stored large volumes of water. The Pennant rock, about 900 feet thick in the Bristol coal-field and extensively developed in Somersetshire, as also around Swansea, was capable of absorbing 12,000,000 gallons in a square mile, 3 feet thick, and specimens of magnesian limestone taken from the neighbourhood of Bristol showed a porosity of 86,000,000 gallons; but the carboniferous limestone was quite the reverse, and only absorbed  $3\frac{1}{2}$  millions. Oolites held vast stores of water, and the rock was much used for building. Shallow well water had been classed by the Rivers Pollution Commissioners as dangerous, and the deep as wholesome; there must, therefore, be a purifying process going on during the percolation into the earth. Nothing in the chemical composition of the rock could purify the water, and to get rid of organic contamination there must be oxidation; and the oxidising agent, he thought, existed in the air absorbed by water, and in the air contained in the interstices of the rock.

Mr. R. F. Grantham read a paper on the Reclamation of Brading Harbour. Reference was first made to the attempt made by Sir Hugh Myddelton, in 1620, to enclose the harbour, an area of about 700 acres, uncovered at low water. The line of the embankment, as laid out by him, had been traced by the discovery of the piles of oak which were used by him. The attempt was successful for a time, but in a few years the sea broke in, and the land was again, until 1879, continually inundated at high-water. In 1874 a company, entitled the Brading Harbour Improvement and Railway Company, was formed, and in 1877 the work of constructing the embankment was commenced. The paper described the form of the embankment and the difficulties met with and failure experienced in closing it at the Bembridge end, and also gave particulars of the methods adopted in piling and planking the gap. The sea was shut out in July 1879, but in the following October again broke in. Further attempts were made to close the gap, and

at length the sea was finally shut out at the end of February 1880. The line of the present embankment enclosed an area of rather more than 600 acres. The works of lowering the sluices, the inverters of which were found to be at too high a level, and of the wharves erected at the St. Helen's end of the embankment, were also referred to, as well as the new channel in course of execution for the river Yar across the reclaimed land. The reclamation works would have the effect of improving the harbour, and opening up St. Helen's and Bembridge.

Lord Rayleigh read a paper on the effect of wind on the draught of chimneys, based upon experiments made with tubes and a fan driven by hydraulic power. He stated that a horizontal wind would usually promote a draught except in cases where the chimney opened out upon a large expanse of wall, and so was indirectly affected. The cure in this case was to carry the chimney higher. When the wind was inclined downward to the chimney at an angle of 30 degrees and upwards, there was a down-draught, and the maximum up-draught was produced by wind inclined upward at about the same angle. The simplest thing to prevent wind blowing down a chimney was to erect a T piece on the top. In that case a vertical or an inclined wind favoured the draught, and the effect of a wind blowing through the T tube was practically nothing.

In the remarks that followed it was suggested that the only real remedy was an increase of draught. A member contended that chimneys should be turned upside down, the opening at the fireplace being narrow and the outlet widened. If all the chimneys in a house could be made to open into a common cloaca a down-draught would hardly ever occur.

Dr. M'Donald, of Netley, read a paper on the perception of colour, dealing with the physiological changes in vision involving the phenomena of colour-blindness. Dr. Gadov, in calling attention to the influence of education in producing recognition of colour, instanced the fact that children when young are not usually correct in selecting colours placed before them, and added that, from the greater number of colour names in the English language compared with the German, the English are educated to a higher perception of colour than the Germans. He held that, to a certain extent, colour-blindness is an indication of deficient development of the power of mental perception.

Mr. R. Etheridge, in the course of his address in the Geological Section, said:—In Selsea I draw attention to a locality of extreme interest both to the geologist and archæologist, and where cause and effect are manifested in both investigations, the historical portion being based upon physical causes and changes that have long been and are still going on, to modify the form, extent, and structure of the Sussex coast, from the mouth of Chichester Harbour to Littlehampton and Bognor. The peninsula of Selsea is celebrated in English history as one of the places where Christianity was first taught in this country. It was one of the most ancient Saxon establishments. This peninsula was granted by Edilwalch, King of the South Saxons, to Wilfrid, the exiled Bishop of York, about the year 680. At that time it is stated to have contained 5,220 acres of land, with 85 families and 250 slaves. The parish now contains only 2,880 acres, 2,340 having been slowly denuded away by the action and encroachment of the sea. This encroachment and destruction during the past 800 years has been very extensive. The creek called Pagham Harbour, on the south-east side of the bill or peninsula, was due to an irruption before the year 1345, when 2,700 acres of land were destroyed. The site of the ancient cathedral and episcopal palace of Selsea, believed to have been situated to the south-east of the present church of Pagham, is no longer to be determined, but there is no reason to doubt but that it stood nearly a mile out in what is now sea. We are led to believe that when Selsea became known to the English nation it was an island, and that in Bede's time the process of silting up the estuary must have commenced; and the completion of this process would seem to have been before the Conquest. The action of the tides on this coast carries the sand and shingle from west to east, therefore the gradual wasting which has taken place on the shore of Bracklesham Bay has served to supply a large portion of the material of which these marshes are formed. The ground on which Selsea, Bognor, Littlehampton, Worthing, and other places on the Sussex coast westward of Brighton are built is of very recent formation, being composed of gravels, sands, &c.

The Merv oasis was described by Mr. E. O'Donovan, in a paper on Merv, as some forty-five miles in length from north to south and thirty-five in breadth. On the eastern margin of the oasis were the ruins of the old cities of Merv. The oldest was about 900 yards square; the ramparts were 40 feet in height—huge earth-banks, in fact. This city was destroyed by the Arabs A.D. 666. The next in age of the cities was Sultan Sanjar. The walls were in a good state of preservation; their circuit was about 2,500 yards, and in the midst of the enclosed space stood the lofty-domed mausoleum of Sultan Sanjar. The town was taken and ruined in the thirteenth century by a son of Genghis Khan. The third and latest city was destroyed nearly a century ago by the Bokharans. It stood close by, and was named Bairham Ali. A little to the northward were the remains of an extensive entrenchment called by the Turcomans Iskander Kala, or the Fort of Alexander. These ruins were entirely uninhabited.

## CONSTRUCTION OF TUNNELS AND BRIDGES.

IN the section of Mechanical Science, at the Congress of the British Association, the presidential address was delivered by Mr. John Fowler on the progress of railway, canal, and tunnelling operations. In the course of his remarks he said :—

The construction of tunnels was not one of the novelties presenting itself to railway engineers, for many miles of tunnel had been driven by canal engineers before a single mile of passenger railway had been built in this or any other country. To foreign engineers belongs the honour of having boldly conceived and ably accomplished tunnel works of a magnitude which would have appalled a canal engineer. Tunnels under broad navigable rivers and estuaries have been a subject of discussion by engineers for at least a century, but the only one at present completed is the unfortunate and costly Thames Tunnel. Two important works of the class are, however, now well in hand—namely, the Severn Tunnel at Portsoken, and the Mersey Tunnel at Liverpool. One lesson enforced by the Thames Tunnel was the necessity of leaving a reasonable thickness of ground between the water and the tunnel. In the Severn Tunnel the minimum thickness is 40 feet, and in the Mersey Tunnel 22 feet. The width of the river at the point of crossing of the former tunnel is  $2\frac{1}{4}$  miles, and the maximum depth of the rails below high water 163 feet. In the case of the Mersey Tunnel the width is nearly three-quarters of a mile, and the depth 144 feet. The Thames Tunnel, as almost every one knows, was carried on by means of a special contrivance termed by Brunel a "shield." No special appliances have been adopted in the case either of the Severn or the Mersey tunnel. Both are driven in the ordinary way, but of course enormous pumping-power is required and has been provided.

Where no special appliances are used in the construction of a subaqueous tunnel it will be clear that an unknown risk is encountered. All may of course go well, but on the other hand something may go wrong. In many cases of tunnels under estuaries, special appliances could be used which would obviate all risk and make the successful completion of the work a mathematical certainty. A tunnel over a mile in length now in progress under the Hudson River at New York is being driven through a silty stratum by the aid of compressed air, with a certain amount of success, as only some twenty men have been drowned up to the present time. The principle upon which the compressed air is used is, however, a false one, since it is merely forced into the tunnel with a view to uphold the ground by its pressure, like so much timbering, and not to keep out the water on the principle of a diving-bell. It is clear, therefore, that the completion of the Hudson River Tunnel, if the present system be persevered in, is purely a matter of conjecture, and all we can do is to hope for the best. The same remark applies, of course, to the Severn Tunnel and the Mersey Tunnel, although in those cases the character of the ground is such that the contingencies are small in comparison with those encountered in the construction of the Thames Tunnel and the Hudson River Tunnel. Nevertheless, unless special appliances of the nature of the pneumatic process be used, a subaqueous tunnel, whether it be the Channel Tunnel itself or one but a few yards in length, must necessarily present an unknown risk. The prototype of all these tunnels is the one commenced at Rotherhithe in 1809, which was successfully driven a distance of 900 feet under the Thames, and failed when within little more than 100 feet of the opposite shore. A tunnel about  $1\frac{1}{4}$  mile in length was commenced about ten years ago under the Detroit River in America, but was abandoned in a similar manner. So far good fortune has attended both the Severn and the Mersey tunnels, and there is, I am glad to say, every chance of its continuing.

Only a few months ago I became aware of the fact that a scheme, identical in all its main features with my Humber Tunnel project, had been suggested for adoption in the case of the Thames Tunnel, in lieu of the plan proposed by Brunel. Fifty-nine years ago a working smith named Johnson proposed to construct the Thames Tunnel without cofferdams by making it in parts 28 feet in length, each part having the ends temporarily stopped up, and being constructed on the same principle as the diving-bell. If another tunnel be constructed under the Thames, which is far from improbable, as the requirements of below-bridge traffic necessitate some such means of communication, it will be built in accordance with the plan suggested fifty-nine years ago by the working smith, and not on that of Brunel's Thames Tunnel, or of any other tunnel yet carried out.

A ferry still is the only means of communication across the Forth at Queensferry. Parliament, by the passing of the Forth Bridge Act during the present session, has given a practical recognition of the truth that the improvement of the Forth passage is a "national object." After consideration of the difficult problem, in concert with Mr. T. E. Harrison and Mr. W. H. Barlow, we unanimously advised the directors of the Forth Bridge Company to abandon the project of a suspension bridge, and to construct a steel girder bridge of the unprecedented span of 1,700 feet. The total length of the structure is  $1\frac{1}{2}$  mile, and it includes two spans, as aforesaid, of 1,700 feet, and two of 675 feet, over the navigable

channels on each side of Inchgarvie. The execution of the work has been intrusted to me, and my intention is that the Forth Bridge shall be not only the biggest, but the strongest and stiffest bridge yet constructed. Although great navigable rivers offer the most serious impediments to lines of communication lying at right angles to the direction of the stream, and necessitate such formidable undertakings as the Forth Bridge, with a clear headway of 150 feet above high water, and the Severn Tunnel, at a depth of 163 feet below the same datum, still it must be remembered that such rivers were the earliest and are yet the cheapest highways for inland communication. Antwerp, the third port in the world, ranking only after London and Liverpool, owes its commercial importance undoubtedly to the Scheldt, which affords admirable water-carriage for a distance of 60 miles from the sea-coast inland. London, similarly, is an inland port situated about 50 miles up the Thames; hence one-half of the distance between Antwerp and London is made up of fine rivers capable of being navigated by the largest ocean-going steamers. Unfortunately, the southern coast of England and the opposite coast of France are indented by no such rivers as the Thames and the Scheldt, or we should never have heard of the horrors of the "middle passage" in "cockleshell" boats, or of the Channel Tunnel.

In referring to the river system in Egypt, Mr. Fowler spoke of the Suez Canal, and when on this subject he remarked :—Far-seeing people, including the late Khedive, have long been of the opinion that another ship canal will be required in Egypt. In 1876 I submitted to his Highness, in accordance with my instructions, detailed plans and estimates for such a canal from Alexandria through Cairo to Suez. The total length of the canal was 240 miles, and with the same width as the existing Suez Canal, the estimated quantity of excavation was 160 million cube yards.

Mr. Fowler terminated his address with some observations on the practicability of establishing Channel communication by means of large floating stations, or ferry steamers, capable of traversing the narrow sea between England and France in little more than an hour.

## THE PRESTON GUILD.

A GREAT disappointment will be felt by the inhabitants of Preston by the announcement made on Tuesday that the Duke and Duchess of Albany would be unable to attend at the celebration of the Guild, more especially as everything has been prepared to carry out the festivity on a scale befitting the occasion. Preston, it appears, possesses no fewer than fourteen royal charters granting, confirming, and enlarging certain privileges to the burgesses. The first of which there is any record is one without date, granted by Henry II.; but from internal evidence it is clear that it must have been granted within ten years of his reign, between 1175 and 1185. This charter grants to the burgesses of Preston "all the same liberties and free customs" which had been given to the burgesses of Newcastle-under-Lyne; and these were that the town be "a free borough, and that the burgesses aforesaid may have a Guild Mercatory, with all liberties and free customs to such Guild appartenancing. And that they may go through all our land with all their merchandise, buying and selling and trafficking, well and in peace, freely, quietly, and honourably. And that they may be free from all toll, passage, pontage, stallage, festage, and all other customs." The witnesses to the Preston Charter are "G. of Ely, and I. of Norwich, bishops; Godfrey de Lucie, earl; William de Mundeville, Ranulf de Glanville, Hugh de Cressy, Ralf Fitzstephen, Bertram de Verdun, Hugh de Laci.—Given at Winchester." Soon after the grant of this charter the local rights, privileges, and immunities of the burgesses, as recorded in an ancient document named the "Custumal," and preserved along with the charters among the borough archives, were confirmed by Henry II. The Custumal is headed "Libertatis Prestonæ de Lege Bretonica." The first recorded Guild Merchant was held in the second year in the reign of Edward III. (1328), but, as in the orders made at that Guild, there is reference to the "orders of a precedent Guild," there is hardly a doubt that a Guild Merchant had been held in Preston many times before that date. It is known that such institutions are of Saxon origin, and Preston was a town in Saxon times, as is proved by its church, then dedicated to St. Wilfrid, being one of three that are mentioned in Domesday Book as existing in the hundred of Amounderness. There are records in existence of twenty-three Guilds, and of these the Corporation possess the rolls of nineteen, including a complete sequence of fourteen, and of the orders of each Guild from 1662 downwards. Up to the Guild of 1542 the celebration was held at irregular intervals, perhaps arising more from the disturbed condition of the country in the Middle Ages than from any other cause. Since that date, however, the Guild Merchant has been celebrated regularly every 20th year. There has been some difference of opinion as to the propriety of celebrating the Guild, the alteration of the municipal law in 1835 having rendered the legal portion of the ceremony unnecessary. There is a general attachment to the custom, however, though there is no longer any sort of commercial or social value in the "rights" of a freeman.

## THE PRESTON LIBRARY AND MUSEUM.

ONE of the incidents arranged for the forthcoming celebration of the Preston Guild was the laying of the foundation-stone of the Harris Free Library and Museum by the Duke of Albany on the 5th inst. The building owes its origin to the late Mr. Harris, who left 100,000*l.* for the erection and endowment of such a building. The site, which is estimated to be worth 30,000*l.*, is between the market-place and Lancaster Road. Mr. J. Hibbert, of Preston, is the architect of the proposed building.

In a report which accompanies his design he says:—If Greek architecture is to be retained in practical service, it is requisite, when opportunity affords, to present new combinations of its forms. For the purposes of a library and museum—a repository of knowledge, of examples of the arts, and of specimens illustrative of the sciences—its suitability will be admitted.

The building is to be three storeys in height, and will be faced on all four sides with ashlar stone. It is provided that the floors should be fireproof in their main construction, and that the rising mains and hydrants for extinguishing any fire that may occur shall be placed on each floor within easy access. The ground-floor is designed to accommodate collections of models and examples connected with the purely industrial arts; on it will also be the lending library and a reading and news room which will accommodate nearly 300 persons. The reference library will occupy the whole of the first floor. The museum galleries are to cover the whole of the upper floor, and will be lighted from the top. These are to be arranged round three sides of the central hall and staircase, one side being devoted to the fine arts, the corresponding side to natural history and physics, and the remaining side to the department of general archæology, ceramic and the finer kinds of industrial art, and illustrations of ethnology. The building is also to contain collections of fine arts and antiquities. According to the plans the staircase to the museum galleries is to be double, so as to regulate the up and down stream of visitors when the rooms may be crowded. With a view to make the interior of the structure as beautiful as it deserves to be, the architect proposes that the central hall and staircase shall be devoted principally to works of sculpture after the antique and later schools. He thinks that it may in that respect be rendered in some degree unique in a provincial town. In his report it is stated that the friezes and metopes of the Parthenon, of the Temple of Theseus at Athens, and the frieze of the Temple of Apollo Epicurius at Phigaleia in Arcadia, may not only be among the models presented of the best Greek art, but can be arranged so as to form the permanent architectonic decoration of those parts of the interior. Some of the finest works of Greek and Græco-Roman statuary, as well as of the later masters, in facsimile reproductions, may be purchased out of the funds immediately available.

## THE LATE MR. ROSSETTI'S WORKS.

MR. VAL PRINSEP, R.A., is at present in Manchester, at the request of the President of the Royal Academy, looking up such works by the late D. G. Rossetti as may be suitable for the proposed exhibition of characteristic pictures by this painter at the Royal Academy Winter Exhibition. Some of Rossetti's finest works have come to Lancashire, and not a few to our own immediate districts, says the *Manchester Guardian*. Mr. Frederick Craven has several of those beautiful subject pictures in water-colours which many judges consider among the most interesting works of our time. Mr. Mitchell has a fine oil picture entitled *Venus Verticordia*, and Mr. W. A. Turner has several of Rossetti's latest and finest works; but these have been so recently shown at the Royal Institution as to need no further notice. Mr. Charles Rowley, jun., has a large drawing in coloured chalks, a masterly study of Mr. William Morris, one of four that used to hang in the drawing-room at Cheyne Walk. Liverpool is fortunate in possessing the largest picture Rossetti painted, and perhaps his finest work. Mr. F. Leyland is the owner of a numerous variety of drawings and paintings, and Mr. Rae, also of Liverpool, has some of the early fine drawings similar in work and subject to those belonging to our townsman, Mr. F. Craven. It will be seen, therefore, that Lancashire will contribute a good selection to this important tribute to one of our greatest modern painters. If we reckon Mr. William Graham, of Major Street, as a Manchester man, our local contribution will be the most valuable in the collection, for Mr. Graham possesses more of Rossetti's finest later work than any other collector. The one other large work besides the Liverpool picture that Rossetti painted is one of his most poetic and thoughtful works. It is a triptych at Llandaff Cathedral. The central subject is inscribed *De Semine Davidii*, and shows a manger with the Holy Family, and a king and a shepherd hand in hand kneeling before them. Behind, in the openings in the wall, are seen angels looking upon the scene. The outer wings have each a figure of the Psalmist in his two characters of king and shepherd. These are inscribed *David Rex* and *David Pastor*. This is an early but lovely work, and should be shown with the others.

## DECORATION OF ST. GEORGE'S HALL, LIVERPOOL.

THE committee appointed to consider the designs submitted in competition for the proposed sculptured panels for St. George's Hall have decided to recommend the council to award the premiums as follows:—No. 1, 200*l.*, Mr. Thomas Sterling Lee, Chelsea; No. 2, 100*l.*, Mr. J. Milo Griffith, Regent's Park; No. 3, 50*l.*, Mr. W. S. Frith, Clapham Road.

According to the description of the models, the design of Mr. Lee represents Wisdom, Justice, Temperance, Orpheus, Tragedy, Comedy, and Astronomy. The author remarks that the parts of the building designed for the introduction of the sculpture naturally resolve themselves into four grand divisions or series, and may be grouped thus:—First series: The six panels on the left of the entrance to be devoted to the attributes and results of Justice. Second series: The six panels on the right of the entrance to be devoted to the causes and results of National Prosperity. Third series: The eleven panels at the north or concert-room end, nine panels of which are on the circular portion, to be devoted to subjects symbolised by the Nine Muses, and the two on the return flanks to be devoted to Orpheus, as symbolical of singing, and to Tubal Cain, as symbolical of harmony. Fourth series: The remaining five panels at the corners of the building to be devoted to subjects emblematic of the Arts.

The design of Mr. Griffith represents Jurisprudence, Mercy, Music, and Navigation, for large panels; Agriculture, Zoology, Painting, and Pottery, for small panels. The author proposes to execute the following subjects for the remaining panels:—Justice, Equity, Fortitude, Judgment, Instruction, Art, Science, Architecture, Astronomy, Chemistry, Commerce, Cotton, Electricity, Engineering, Geology, Industry, Poetry, Pottery, Sculpture, and the Drama.

Mr. W. S. Frith's design represents Justice, Education, Almsgiving, Painting, Music, Literature, and Agriculture. The author proposes the following subjects for the remaining panels:—Mercy, Truth, Faith, Eloquence, Freedom, Courage, Hospitality, Enterprise, Nursing the Sick, Sculpture, Architecture, Dancing, Astronomy, Chemistry, Commerce, Law, Invention, Engineering, Shipbuilding, Mining, and Weaving.

## ST. GERMAN'S CHURCH.

ON occasion of the excursion of the British Archæological Association on Monday, Mr. Brock read a paper on this church, in the course of which he said:—In 936 Conan was made Bishop of St. Germans, and in 986 Bishop Stidius placed the see and seat of his cathedral here, on the burning of the cathedral of Bodmin by the Danes, and here it remained until 1050, when the sees of St. Germans and Crediton were united under Bishop Leofric at Exeter. The building consists of a Norman nave and north and south aisles, two western towers which are not of the same design, and a fine Norman doorway forming the west entrance to the nave. The north aisle was demolished at the end of the last century. There were two statements made with respect to the structure which might be referred to for decision at their hands, since probably the building had never yet received so critical an inspection as it would undergo by their visit. The first was the statement made by Whitaker, who believed that the south-west tower and the south aisle alone formed originally the ancient cathedral of Cornwall. It might be allowed that the most ancient churches of the county were of small dimensions. There was almost always evidence that each time a church was dealt with, it was to enlarge it, but he confessed that, after a careful inspection, he could find nothing here to justify Whitaker's belief. The other statement was that of Lysons, that the south aisle was rebuilt in 1261, while Oliver, quoting from the Diocesan Registry, records that the church was consecrated August 28, 1261. Neither of these statements were, however, borne out by the structure. There was good Norman work of the twelfth century, Decorated of the fourteenth, and Perpendicular of the fifteenth, but hardly anything that could be assigned to the thirteenth century at all. He had pointed out elsewhere that the effect of a constitution of the Legate Otho in 1237 was to cause a great many churches which had not previously been, to be consecrated then; and was it not possible that the bishop of the diocese of that date, having reason to doubt that St. Germans had never been consecrated, it was then done? Some such supposition was necessary to account for its consecration at the date named. Mr. Brock further described the church, and ventured to say he had come to an opinion contrary to that generally received with reference to the comparative age of the east and west ends of the church. He considered that the west end was the earliest, and that the monolith granite pillars of the eastern part of the arcade were earlier than the freestone pillars of the western part of it. He knew that many archæologists believed that the Normans never worked in granite; but if the ancient Britons could work such wonderful interlaced crosses, the Normans would have been far behind them if they could not have made such simple pillars.

## HEXHAM ABBEY.

AN excursion was made last week by the Architectural and Archæological Society of Durham and Northumberland to Hexham Abbey-church, where a meeting was held in the transept, under the auspices of the president, the Rev. Canon Greenwell.

Mr. C. C. Hodges, the author of a monograph of Hexham Abbey, explained the result of the excavations made by himself on the site of the nave. He said his work would not be historical so much as archæological and architectural. There were men far better able than he to deal with the historical part of Hexham, and who, in fact, had dealt with it. He only intended to give a history of Hexham Abbey as it was shown by the stones of that church. The spot was of classical interest. He thought there had been a Roman town there, or at any rate there was a church in 674. He thought the nave of Hexham Abbey was never erected, and never was necessary. The transepts were larger than any other in England, compared to the size of the choir. The length of the church from end to end was 257 feet 3 inches. The reason of the transept being so long he could not find out. In the excavations that had been made they found two Norman capitals, probably belonging to St. Mary's parish church of Hexham, which was the only Norman work found in Hexham. The abbey gateway was built about 1200. The other old buildings were the Moot Hall and the manor offices, the first erected between 1346 and 1400, and the reason of it being to protect the market-place and that side of the town from any invasion. The walls of the manor offices were 11 feet in thickness. The dungeons were closed up, and had been so for a great many years. There was nothing to show that these buildings belonged to the abbey. In the time of Elizabeth they were used by the Keeper of Tyndall, and belonged to the Crown. Mr. Hodges then proceeded to refer to the history of the abbey. He said the president and himself were at issue as to whether Hexham was a Roman town or not. They had a large number of Roman stones in Hexham, and there must have been a large quantity in it when the Saxons were there. He did not think they were brought there, as they were not the same stones that were brought from Corbridge. Another strong point was that Prior Richard, in his history of Hexham, says there were remains of very magnificent buildings of great antiquity, and he would not say that if they were Saxon buildings. The Saxons would have merely a collection of thatched huts. In the crypt they had two Roman inscriptions. There were three Roman altars there; there had been five altogether. Two in the south transept were of the same stone as the Roman slab, found last year by Mr. Robson the clerk and himself in the excavations, of the Roman standard-bearer. There were a large number of Roman road stones lying about in Hexham in the fourteenth century. Mr. Hodges then referred to Hexham in the time of the Saxons. In 674, St. Wilfrid erected on that spot the Abbey. He believed St. Wilfrid erected it there because there were a great quantity of Roman road stones and building material to do it. After Wilfrid there was a succession of eleven Bishops of Hexham. The cathedral there died a natural death about 821 or 822. It was said it had been destroyed by the Danes, but as they did not come till 875 he did not think it was good evidence. The see was transferred to Lindisfarne. Hexham was in ruins, and when it became a bishopric again it was carried on by an abbot as its superior. From 875 to some time in the tenth century they knew very little of Hexham Abbey except that it was a parish church. The mediæval history of Hexham then began. A priory was founded, which lasted till 1538; it had a succession of fifty-six priors. There was nothing to show when the building of the present church began; and he had to fall back upon the architecture and arrive at the time by analogy. He thought 1185 was the date of the choir; it was built very slowly. He did not think the tower was built till 1270 or 1280. He could not find any masons' marks. When they got into the transepts they had different masons' marks altogether, and this showed there was a distance of time between the erection. In the aisles of the choir they had distinct transitional features. He thought the present church was wider than the Saxon church, a description of which they had by Richard. He would be able to show a piece of Saxon foundation in which was found a portion of Roman stone. The crypt was discovered in 1726 in erecting a buttress. In digging the foundation for the buttress the workmen got into the north passage of the crypt. It was a great "find" then; all the altars were there at that time. In clearing away the rubbish the other day from the floor of the crypt, Mr. Robson found a fragment of stained glass of the thirteenth century. There were found some pieces of pottery which the president thought were about the date of 1680. The size of the crypt was 13 feet 6 inches by 7 feet 9 inches, and 9 feet 1 inch in height. Mr. Hodges, after further describing the crypt, spoke of the attack on the Abbey by the commissioners of Henry VIII. at the time of the dissolution. The prior was hung at Tyburn. He next told the story of the priory from the time of the dissolution to the present, during the greater part of which time it had been used as a parish church. By the restoration there was a great deal destroyed. In 1760 one of the Blacketts erected a gallery in the church. From then till 1830 very little was done, but after that much destruction took place. In 1830, he said, a

heating apparatus was placed in the transept, and a great many slabs and grave covers were taken up, and many of them had been destroyed. Two shrines had since been swept away from the choir, and half of the stalls, the sedilia, and the beautiful range of chapels of the fourteenth century, which formed the eastern portion of the church, had shared a like fate. The restoration of 1869-71 greatly improved the transepts by opening out the western tower and lowering the floor to its original level, but it was to be regretted that the beautiful doorway made in the north transept by the Mercers' Company of London was at this time destroyed.

The President remarked that it was inconceivable to him that there should be a Roman settlement at Hexham, because it was so near to one of the most important settlements in Roman times in that part of the world, namely, that at Corbridge. He did not think the Saxons would trouble to provide stones for their buildings when they could get them already dressed from Corbridge. As to the statement of Richard, who lived about 1140, he might have referred to Saxon buildings which were erected in the eighth century as being of great antiquity.

## SILCHESTER.

AT the annual excursion of the London and Middlesex Archæological Society, a visit was made to the old Roman city of Silchester. Mr. James Parker, of Oxford, who was present, described the various Roman and other roads which approached Silchester or Calleva Atrebatum. He proceeded to point out that the history of Silchester, so far as recorded history went, was summed up in the attempt to find its name. Certain itineraries had come down to us from Roman times, the greatest being that of Antonine. In this, fortunately, four different routes mentioned a place called Calleva. In the thirteenth and fourteenth itineraries they found mentioned a place called Spinis, which writings still in existence identified with Speen, near Newbury; and Spinis was mentioned in the itinerary as the place where the road crossed the river; and a reference to that itinerary would help them in coming to the decision that Silchester was the ancient Calleva. He mentioned that because it was claimed for other places that they were on the site of ancient Calleva—for instance a book was published last year the main purpose of which was to prove that Calleva was Wallingford. In addition to the Antonine Itinerary, they had the Geography of Ptolemy, about A.D. 120 or 130, in which they found this—"Next to them the Dobuni, and their town Corinium; next the Atribatii and their town Kalkoua—or Calcova, which was a nearer approach to the spelling of the name Calleva than we sometimes found in reading of some places abroad at the present day, and was therefore strong proof in confirmation of Silchester being the ancient Calleva. But Henry of Huntingdon, writing in 1120-40, in copying the cities of the Nennions, had applied the names in the best way he could to such modern places as he knew. It shook their confidence in him that he put Silchester on the Thames. But why did he call that place Segont? He was acquainted with Cæsar's Commentary; and unfortunately in his day there were antiquaries, and he endeavoured to apply every name he met with to some place or another, and so, as he wanted to find a place for the Segontiaci, and he knew they were somewhere near the Thames, when he found the word Segontio in the Antonine Itinerary (which no doubt meant Carnarvon), he called Silchester Segont; and that was why he wrote that it was "on the Thames, not far from Reading," which as they all knew was very inaccurate. Every other writer had followed him. As ill-luck would have it, about 125 years ago, someone in digging in Silchester came across the words "Deo her Saegon t. Tamman saen Tammon vitalis Hono;" and of course that was laid stress upon as absolute proof that Silchester was Segontium, and not Calleva. Another theory had been started, that the place was once called Segontium, and afterwards Calleva; but the people who talked about that, if driven into a corner, were not satisfied which it was called first.

On the whole, he felt satisfied that they must come to the conclusion that Silchester was Calleva. Camden came to the conclusion that the place was called Vindonum, and placed Calleva at Wallingford. Camden spoke of creeping through "Onion's hole," and Gough took that as the name, and was immediately puzzled why "se" or "seg" was added, coming to the conclusion that the place was called Segonion for euphony. He (Mr. Parker) admitted that in a great many places he could not trace the Roman road which led to Calleva from London; but if they looked at the Ordnance map they would find that it ran as straight as possible as far as Staines, and it might be fairly traced to Silchester. Gough, commenting upon Camden, says "a military road called Lonbank, pitched with flints, runs from the south gate of the town to the north gate of Winchester;" and Man, writing in 1735, said he could trace the road distinctly from Silchester to Old Sarum. Dr. Beker, in 1804—and he quoted this just to show the sort of thing that was written on the subject—said that "no traces remain of any regularly drawn road from Silchester to Newbury," and made Calleva Reading, because of the name of Coley. Mr. Parker then went on to explain the plan of the Roman remains a

Silchester. If they walked round the wall they would find that they had walked  $1\frac{1}{2}$  miles and 30 yards; and, roughly speaking, the city was half a mile across. The Forum was very nearly, or quite, in the centre. Having given a slight sketch of the explorations which had been effected previous to 1864, and since that date, Mr. Parker pointed out that the best remaining portion of the wall was on the north side of the city, near the amphitheatre; and the work in the wall had been really magnificent. It was surrounded originally by a moat 30 feet deep. At the beginning of the last century the wall was in many places very much higher than it was at present, and showed traces of having been at least 9 feet thick throughout. They must remember—a fact which was too often forgotten—that from the coming of the Romans to the time of their leaving was at least as long a period as from the Conquest, say, to Edward, III., and that there were different stages in that history which were totally different one from another. It was too often forgotten that Julius Cæsar simply came over here, fought one or two battles, and made peace; came again, won, took hostages, and said he had conquered. When Claudius came in A.D. 40 he had to begin again; and there was no doubt the campaign of Aulus Plautius was very difficult, and gained no advantage from Cæsar having previously landed. That campaign merely settled one or two stations; and it was not until about A.D. 140 that the Romans got anything like a sufficient series of stations to call Britain in any sense their own. The history of the occupation of Britain by the Romans was much the same as the history of our occupation of India. He thought that the city of Silchester was more probably built in the third even than in the second century. Then the question arose, Why was it erected there? The probabilities were that it was a great central place, owing to its position in regard to the roads, and then arose the great *crux*—was it made on account of the roads, or were the roads made from London on account of Silchester? The roads were second-century roads; and he believed the city was built because of its central position in relation to them, so as to enable the heads of the different tribes to come up to pay their annual or half-yearly tribute—according to who was the Chancellor of the Exchequer in those days. No doubt very important documents and large sums of money were kept there, and, as in India, revolts might occur at any time, and the hordes rush upon the place, so that fortifications were necessary. It was not a city like London, which grew by degrees; but the walls were evidently built first, and afterwards the forum, temple, houses, &c., were built inside. His impression was that a great part of the eighty acres enclosed by the wall was never occupied at all. A large place was prepared for occupation, and if the Romans had not had to leave in 410, the chances were that by now that city would, like the city of London, have extended ten times farther on either side. It was not a military but a tax-collecting station, with a large forum in the centre in which the taxes were gathered and causes heard; though it no doubt possessed barracks for the soldiers who guarded the place.

#### EXCAVATIONS AT LEWES PRIORY.

THESE excavations have, says the *Sussex Advertiser*, been pushed on steadily during the last fortnight, and despite the huge accumulation of the *débris*, amounting to as much as 12 feet in depth in most places, which has had to be cut through, it is now possible to make out more or less accurately the disposition of the buildings whose sites have been excavated. The sub-structure of the dormitory, which occupies most of this area, is formed of a number of square chambers communicating with each other by wide single arches or double doorways. Most of these, however, have been filled in at some later period, but prior to the suppression, with chalk masonry, probably on account of some threatened collapse of the Roman work. The walls are in some places still covered with a most perfect coating of plaster—a mode of treatment far more prevalent in olden times than is usually supposed. By permission of the London, Brighton, and South Coast Railway Company, excavations have been made in the sides of the cutting through which the railway passes. These were most successful, resulting in the finding of the north-east angle of the refectory and the adjacent angle of the cloister. Behind these was uncovered an ample circular staircase or vice, corresponding in position with the one still existing on the south. It is to be hoped the railway company will cause these to be preserved to view and not covered up again. The line of the east wall of the cloister has been carried across the railway, and the continuation of it which formed the great south transept wall discovered in the bank. Similarly the north wall of the refectory has been opened out near the underground conduit, commonly known as the “lantern” or “prison.” It is now possible to ascertain the exact site of the cloister, and therefore of the nave of the great church of which a fragment of the west end was uncovered some years ago.

The Tower of St. Chad's Church, Stafford, which is in a dangerous condition, is to be completely restored, at an estimated cost of 1,400*l*. A gentleman in the town has contributed 500*l*. towards the amount.

#### ST. JULIAN'S WELL CHAPEL.

AT the conversazione at the Plymouth Guildhall on Monday Mr. J. Hine, F.R.I.B.A., read a brief paper on “St. Julian's Well Chapel, Mount Edgcumbe.” Mr. Hine said:—Probably the smallest and most ancient example of that curious and to some extent unexplained class of buildings, the Cornish well-chapel, is this little building at Mount Edgcumbe. Its internal dimensions are only 6 feet 3 inches by 4 feet 9 inches, and it was vaulted over by an equilateral stone arch formed by level bedded courses of masonry, with a central chamfered rib resting on moulded corbels. The doorway, or rather gateway (because there was no door), at the entrance end had also a pointed arch springing from the same line as that of the vault. The proportions are as simple as they are beautiful, and the details and character of masonry fix the period approximately as that of the early part of the fourteenth century. It appears not to have been thought essential that these well chapels should stand east and west, like our parish churches, and whilst St. Cleather Chapel follows that position, this little chapel is placed north and south. At the southern or fountain end is a niche, which probably contained a figure of the patron saint. In the western side wall, near the fountain, is another and lower recess, with an ogee chamfered head corresponding with the other. The jambs (existing) of the doorway, the rib and corbels of the roof, and the niches are of a green freestone from the parish of Landrake; the rest of the masonry is of more local stone. The pavement was of red and green glazed tiles, fragments of which we have found. This interesting little structure is being restored by its noble possessor and careful guardian—the Earl of Mount Edgcumbe. Cornwall has very many of these well chapels, some in a tolerably perfect state, others in ruins; many others have been barbarously destroyed. I am glad to hear that a Cornish antiquary—Mr. Couch—has made careful drawings and notes of most of them, which we may hope will one day be published. There is much yet to be learnt respecting them.

#### RESTORATION OF PORTSEA PARISH CHURCH.

AN appeal for funds for the restoration of this church has been made by the Vicar, the Rev. Edgar Jacob. The following is an extract from his letter to the *Times* of Tuesday last:—

Tuesday, August 29, will be the one hundredth anniversary of the loss of the *Royal George*. Of the nine hundred who perished on that sad occasion, the bodies of thirty-five were washed up by the tide and buried in the old churchyard attached to the parish church of Portsea (St. Mary's, Kingston). Two simple tablets, one a tribute from a stranger, mark the spot, but, like the churchyard in general, which contains many other monuments to gallant sailors, they show unmistakable symptoms of decay.

The historical interest is not confined to the churchyard. An old dilapidated tower, containing two bells that are cracked and four others which would bring the tower down if they were fairly rung, is all that now remains of a curious church, which would be an object of antiquarian interest if it had not been taken down in 1843; but the old font which, with the sexton's aid, I rescued and replaced in the church in 1878, when I became vicar of the parish, is the same in which two men, whose names are now historical, were, among many others, baptised early in the century. “On November 1, 1806,” to quote the register, “Isambard Kingdom, s. of Marc (*sic*) Isambard Brunel and Sophia his wife;” on March 4, 1812, “Charles John Huffham, s. of John and Elizabeth Dickens.”

A fund is now being started to enlarge the parish church by the addition of transepts and chancel, so that it may accommodate at least 1,500 instead of 1,000 people, to rebuild the tower, and to put the churchyard eventually into thoroughly good order. The work has been entrusted to an eminent architect, Mr. A. W. Blomfield; and a parochial meeting will be held on August 29 to consider ways and means. We are told that we shall require 10,000*l*.

**Railways in Australia.**—The Railways Construction Act of 1880 for the colony of Victoria sanctioned the construction of 487 miles of new lines. 389 have been made or are in course of construction. The surveys have been completed in every case, and in the course of the present month tenders are to be invited for the remaining lines scheduled in the Act referred to. On December 31 last 1,247 miles were open, and had cost on an average 14,800*l*. per mile. The original lines cost about 40,000*l*. per mile, but now the Government is able to construct at about 4,000*l*. per mile. The total cost of construction has been 18,750,000*l*. The total of the funds obtained to meet this expenditure is 28,487,000*l*, of which sum about 1,000,000*l*. remained unspent. From English capitalists 17,000,000*l*. of the total amount had been obtained, and 2,200,000*l*. from the proceeds of land sales. Since December last 46 miles have been opened, and 408 miles are in course of construction, making the total length open and in progress 1,701 miles. A new Bill provides for 56 new lines or extensions, to cost in all 2,433,194*l*.

### St. Paul's Church Competition, New Swindon.

SIR,—I should not have troubled you about this subject had not my name been mentioned by Mr. Vacher in connection with it. The nave and aisles, carried out under my superintendence, were consecrated on June 28 last year, but my instructions had been to prepare designs for the entire building. These complete plans were approved by the Ecclesiastical Commissioners as well as the Incorporated Church Building Society. When I saw the advertisement about the competition I was greatly astonished. I at once wrote to Mr. West, secretary of the Building Committee, protesting against the whole proceeding, which, moreover, I considered cast a slur on my professional reputation, so far as the outside public are concerned. Mr. West was good enough to reply that the committee who employed me had "long since dissolved, and the affairs handed over to an entirely new committee, who, on the grounds of equity to our own local architects, resolved to throw the work of the chancel, vicarage, &c., open for competition. I can assure you that no member of the committee had the remotest idea of ignoring you in the slightest degree." I was agreeably surprised to see Mr. Vacher's letter, for which I beg to thank him.

Your obedient servant,

15 Spring Gardens, London, S.W.: B. EDMUND FERREY.  
August 28, 1882.

### The late Mr. Edmund Walker.

SIR,—I have looked in vain for an obituary notice in your journal of the late Mr. Edmund Walker, of Maitland Park, N.W., an artist well known to architects, many of whom will be sorry to learn he passed away on the 9th inst., aged 68.

To his skill in water-colour drawing not a few of the leading architects of present and past days have been indebted for his highly artistic rendering of their perspective outlines, and they could always rely upon him for rapidity as well as excellence. His professional career is full of historical interest. Some forty years ago he had a lucrative practice in miniatures on ivory, and was well patronised. The daguerreotype process, followed by photography, destroyed that connection. He then visited many of the country seats in England, Chatsworth amongst the rest, and made local and finished drawings of the mansions, whose owners readily purchased them. Prior to 1851 he became connected with the then firm of Day & Son, and executed all those noted large interiors of the Great Exhibition of that year, first in water colours and afterwards in chromo-lithography. On his judgment and taste the late Sir Joseph Paxton, Sir Digby Wyatt, and Owen Jones largely relied for the effective placing of the principal objects in that Exhibition; and the late Captain Fowke engaged him for similar drawings for the 1862 Exhibition, but these were not published.

He was commissioned to paint the opening ceremony of the Horticultural Gardens, but as the Queen was prevented being present the picture passed into the hands of the then Baroness Burdett-Coutts. The first water-colour drawings of the Thames Embankment exhibited by Mr. Bazalgette in the Royal Academy, which all who then saw them will doubtless well remember, were by Mr. Walker, and it was not uncommon in those days for his work to be seen in a dozen or more drawings in a single year in the architectural room of the Academy exhibition. His artistic powers were versatile: buildings, landscapes, figures, battle scenes, and any other subjects were handled in a masterly way. All the sketches made by Mr. Simpson during the Crimean War were rendered by him as finished productions in chromo-lithography, and afterwards those of the Indian Mutiny, published by Messrs. Day & Sons. In the misfortunes of that firm he largely participated, a blow from which he never fully recovered. His gentlemanly bearing and refined feeling and honourable dealings, added to his ready apprehension of what was wanted, and his punctuality in keeping engagements, attached many architects to him very closely; and the profession has sustained a loss.

I remain, sir, yours truly,

2 Chancery Lane, W.C.: H. J. PAULL.  
August 24, 1882.

### Stratford-on-Avon Board School Competition.

SIR,—Will you kindly correct an error in the report of the above competition which appeared in your issue of the 26th inst. The author of the design sent in under motto "Experience," which was placed first by Mr. E. R. Robson, the professional assessor, but subsequently rejected because of the omission from the plans of the lines indicating the possibility of future extension, was not Messrs. Giles and Brookhouse, of Derby, as stated, but Mr. W. Hawley Lloyd, of 79 Colmore Row, Birmingham.

Yours truly,

Stratford-on-Avon: W. A. L. THOMPSON,  
August 29, 1882. Clerk to the said Board.

### Glasgow Municipal Offices Competition.

SIR,—In making a cube estimate of my design, to which the first premium was awarded in the first competition, I valued the whole at 1s. a cube foot, taking the height in the usual way from the bottom of foundations up to half the height of roof, the result being 150,432 $\frac{1}{2}$ . The towers were included in that valuation at the same rate.

Mr. Barry, in his report, said that he considered the estimate insufficient, and that it would require 220,000 $\frac{1}{2}$ , without reckoning the sculpture.

The author of the design now adopted estimated the basement storey up to ground floor at 9 $\frac{1}{2}$  a cube foot, thence to half the height of roof at 1s., and the towers above that level at 1s. 6 $\frac{1}{2}$ .

Mr. Barry considers this estimate sufficient.

I have not seen Mr. Young's design, but from the published descriptions it does not appear to be any less elaborate than mine.

If that is the case, Mr. Barry has evidently modified his views of the cost of building in Glasgow to a very considerable extent.

Yours truly,

G. CORSON.

### ENGINEERING WORKS.

**East River Bridge, New York.**—Marked progress, says the *Scientific American*, has been made toward the completion of the East River Bridge. The bridge is designed to carry three kinds of load—the outside roadways being for waggon traffic, the middle one for a promenade, with the railway trucks on either side of it, and between it and the roadways. The approach on the Brooklyn side differs from the New York approach in having iron street bridges at all of the streets. The New York approach has but one iron street bridge, and this is at Franklin Square. All the other streets are spanned by massive arches of masonry. The bridge at Franklin Square presents several engineering difficulties of more or less importance, for it is longest on the up-stream side, it is skewed at both ends, it is on an incline, and it must be adapted to three quite different kinds of load. The form and inclination of the bridge necessitates a great variety of fastenings, of different angles and shapes, and call for somewhat complicated calculations, and a large number of drawings. The total weight of metal in this bridge in round numbers is 1,000 tons. Of this, 1,658,279 pounds are wrought iron, 82,092 pounds steel, 27,440 pounds steel pins, 146,891 pounds cast iron. The width of the bridge over all, 88 feet. Length on the longest side 206 feet. Length of longest truss 198 feet 5 inches; length of shortest truss 163 feet 10 inches. The outside roadways will be 16 feet 7 inches wide between fenders. The two railroad-ways will be 12 feet each. The promenade will be 17 feet 7 inches wide. The parapet is of unique design, and harmonises with the character of the masonry parapet on the rest of the approach. The Brooklyn approach intersects, at an angle of about 45°, York, Main, and Prospect Streets, over which it is carried by wrought-iron bridges composed of riveted plate girders. The bridges rest upon stone abutment walls, and have a grade of 2·8 per cent. The York Street Bridge consists of six single-web riveted plate girders, 9 feet deep and 85 and 86 feet long, having lattice cross-girders riveted to them, these latter supporting longitudinal rolled floor-beams. Buckled plates cover the outer floor-beams, and are riveted to them. The bridge seats are 42 feet above the street level. The Main Street bridge is similar to the York Street bridge, and is about the same length. The mean height of the bridge seats above the level of the street is 22 feet. The approach where it crosses Prospect Street is curved, the mean radius being 260 feet. The Prospect Street bridge has six continuous girders, 2 feet 6 inches high, in three spans, one continuous girder in two spans, and six single girders. The continuous girders are parallel to each other, but the other or outer girders are placed so as to conform as nearly as possible to the curve of the approach. The cross girders of this bridge support, as in the other bridges, the longitudinal rolled floor beams. This bridge is supported by two stone abutment walls and two rows of columns, located at the curb lines of the street. All the girders of this bridge, both main and cross, are of the single-web riveted plate type. The total weight of metal in the street bridges of the Brooklyn approach is as follows:—York Street bridge, 561,338 pounds; Main Street bridge, 551,342 pounds; Prospect Street bridge, 185,430 pounds.

**American Railways.**—Mr. West, her Majesty's Minister at Washington, reports that the extension of the railway system in the United States in 1881 has been greater than in any previous year. During the year 1881, 9,358 miles of railway have been built. The cost, at 25,000 dols. per mile, is reckoned at 233,950,000 dols.; expended on lines in progress, 75,000,000 dols.; expended on old line, 100,000,000 dols.; total, 408,950,000 dols. It is expected that the mileage to be opened in 1882 will equal that of 1881. Up to June 1, 1882, 3,677 miles of line were opened, against 1,734 for the same period of 1881. Although this increase will not continue, it is likely that the mileage opened this year will not fall short of 10,000 miles. The railway mileage rose from 52,914 miles in 1870 to 104,813 miles in 1881. At a similar rate the mileage in 1890 will exceed 200,000 miles.

## ARCHÆOLOGY.

**Sandown Castle.**—Instructions have been issued for commencing the work of removing this structure. The masonry is to be removed to the Constable's Tower at Dover Castle, to be employed in the construction of a residence for the General Commanding the South-eastern District, so that the new residence may be more in character with the appearance of the ancient masonry of the castle than would be the case if new stone were used. The amount of material to be removed will exceed 600 tons. The sea has been allowed to encroach, and for many years past the network of subterranean corridors has been filled with shingle, and subject to the destructive action of the sea waves. The plan of the castle may still be very distinctly traced, and with the exception of the southern portion of it the moat still exists. The outer portion of the masonry is of Kentish rag, the interior being of dressed Portland stone. The castle was constructed with four round bastions of thick arch-work with numerous embrasures. From the centre rose a round tower, having a cistern at the summit, and beneath an arched bomb-proof cavern. The walls are about 20 feet thick at the foundation, gradually diminishing as they rise, the summit having originally been about half that thickness. One of the principal historical events connected with the history of the castle is that during the reign of Charles II., Colonel Hutchinson, who had been a member of the Long Parliament and governor of Nottingham Castle, was a prisoner within its walls, and died there in September 1664.

**The Metopes of the Parthenon.**—Mr. C. T. Newton writes:—"I have from time to time noted in the *Academy* the discovery of new fragments of the pedimental sculptures, metopes, and frieze of the Parthenon. I have now to announce a very important addition to a metope which has just been made by Dr. Charles Waldstein. In a recent visit to the Louvre he observed a male head corresponding in scale and style with those of the Lapiths in the groups of the metopes. Having obtained a cast of this head, Dr. Waldstein brought it for examination to the British Museum. It was at once identified as the head of the Lapith in the metope marked No. 6 in the Guide to the Elgin Room ('Museum Marbles, vii. pl. 3; Michaelis, Parthenon, pl. 3, vii.'). The head of the Centaur in this group, which is at Athens, had been previously identified. By the addition of the head of the Lapith, his antagonist, through Dr. Waldstein's happy discovery, the metope has gained immensely, and seems animated with new life and spirit."

## GENERAL.

**Sir Frederick Leighton, P.R.A.,** left England on Tuesday for a tour in the East. He purposes visiting Constantinople and Jerusalem, and subsequently the seat of war in Egypt.

**Mr. M'Whirter, A.R.A.,** is at work on a large picture of the village of Corrie, in the Island of Arran. The white cottages nestling under the green hillside, and the sea driven on the rocky coast by a south-east gale, will doubtless furnish him with a congenial subject.

**Sir J. A. Macdonald,** Minister of the Interior, Canada, in his annual report, presented to the Dominion Parliament during the last session, says that satisfactory progress is being made by the Survey Department, 9,000,000 acres having been laid out into townships and subdivided into sections and quarter-sections during the year. The amount of field-work in this may be judged from the fact that it involved the demarcation and measurement of over 23,000 miles of survey line.

**Sir J. H. Ramsay** has continued his investigations on the national finance in the fourteenth and fifteenth centuries, and has contributed an article on the accounts of Henry IV. (in continuation of a former one on the accounts of Richard II.) in this month's number of the *Antiquary*.

**Mr. John Gee,** of Macclesfield, has accepted the tender of Mr. W. F. Mason, engineer, Longsight, Manchester, for one pile of Jennison's patent smokeless Decker baking ovens.

**Mr. W. H. Smith, M.P.,** has just lent his portrait of Lord Beaconsfield, by Mr. Millais, to the Art Department of the Worcester Exhibition.

**Charles Sohn,** artist, of Dusseldorf, has been, it is stated, commissioned by the Queen to furnish portraits of the Prince of Wales and his family to King Cetywayo.

**King Ludwig of Bavaria** has granted a concession for an International Art Exhibition in 1883. The perfect success of the last is ascribed to be largely due to the contributions of the English painters in water-colours.

**The Hove Commissioners** have had under consideration reports from the town surveyor and from Sir John Coode in regard to the encroachment of the sea on the eastern part of the foreshore. Sir John Coode recommended the erection of a sea-wall and six new groynes, at a cost of 15,000*l.*; but the suggestion of the surveyor, proposing the erection of three new wooden groynes, at a cost of 2,800*l.*, has been adopted.

**The Education Department** have signified that school accommodation must be provided for about 2,000 children at Birkenhead within six months' time, failing which a School Board will have to be formed for the district.

**Plans** have been prepared by Messrs. Hine & Odgers, of Plymouth, for new Wesleyan Sunday Schools at Bodmin.

**A "Fantasye Fayre"** was opened on Wednesday at Scarborough, in aid of the fund for the erection of a new church. A plan by Mr. C. Hodgson Fowler, of Durham, has been approved of for the church, the estimated cost being about 3,000*l.*

**Thames Bridges.**—Workmen have begun to remove the aqueduct across the river at Putney to allow of the erection of the new bridge, the temporary bridge which carries the water-pipes by the side of the old wooden bridge having been completed a short time ago. The bridge is to be completed in five years. Hammer-smith Suspension Bridge is to be closed for two years during its reconstruction. Ferry-boats are to be provided by the contractors for the convenience of the inhabitants.

**The Worcester Music Hall,** which was destroyed by fire, has been reopened after being restored and enlarged at a cost of nearly 5,000*l.* Messrs. Wood & Sons executed the work, under the direction of Mr. Rowe, architect.

**M. Gaillait,** a Belgian painter, has declined to receive the medal awarded to him by the jury of the International Exhibition at Vienna, on the ground that works of fine art are incapable of being classified and distinguished like mechanical products.

**The Metropolitan Board of Works** have decided to postpone the enlargement of their sewage reservoirs at Barking Creek and Crossness in deference to the Royal Commission to inquire into the pollution of the River Thames.

**A New Commission on Historical Manuscripts** has been gazetted. The object of the Commission is to "call in the aid and co-operation of all possessors of manuscripts and papers, and to invite them to assist in furthering the objects of this Commission, giving them full assurance that no information is sought except such as relates to public affairs, and that no knowledge or information which may be obtained from their collections shall be promulgated without their full licence and consent."

**The Gift of a Site** and 6,000*l.* on the part of an anonymous donor towards the proposed new Infirmary at Stratford-on-Avon, was announced at the annual meeting of the Governors on Monday.

**The Publication** of a curious collection of London signs of booksellers, publishers, and printers, up to the end of the seventeenth century, is commenced in the September number of the *Bibliographer*.

**The Electric Light** is being introduced in the town of Cleethorpes, near Grimsby. There are to be five large arc lights, four of these being along the cliff which overlooks the sea, and forty-two small incandescent lamps of the Lane-Fox pattern. The light is to cost the parish 130*l.* a year.

**An Art and Industrial Exhibition** has been opened at Amptill. Valuable paintings and works of art have been lent by the leading county families for the occasion.

**The "City Press"** states that it has been determined to reopen the Bank of England entrance in Princes Street, which has been closed for nearly half a century. The solid masonry and brickwork which have for so many years hidden the massive gates from view inside the building have been removed, and shortly those having business to transact in the vicinity of the office of the secretary will be able to do so without having to perambulate numerous passages and corridors.

**The Autumn Exhibition of the Royal Birmingham Society of Artists,** which opened on Monday, is pronounced to be the finest collection of pictures ever shown in Birmingham. The Committee have hung 782 out of the large number of works submitted, which fills up all the wall space available.

**The Paris Fortifications.**—In the event of the measure brought forward by a member of the French Chamber for the razing of the fortifications which encircle Paris being carried, the area of land rendered available for building purposes will be little short of five million square metres, as the fortifications, which have a circumference of 33,165 metres (nearly twenty-one miles), are 142 metres broad. In addition to this, there is a zone of land 250 metres broad outside the fortifications, which is retained by the Government for strategical purposes, and which cannot at present be built over, except upon the express understanding that the Minister of War shall be at liberty to demolish the houses, &c., whenever he may think fit. This "zone of military servitude," as it is termed in French, covers 8½ million square metres, making a total of 13,560,000 occupied by the fortifications. The value of this land, estimated by M. Thiers at 560,000*l.* when the fortifications were erected in 1840, is now put at about 2,800,000*l.* The value of land is still rising, and as the number of houses in Paris has increased from 71,873 in 1876 to 82,352, and as despite this addition to the number of houses the average number of inhabitants to each has increased from twenty-six to twenty-eight, it is very evident that the land now occupied by the fortifications will soon be built over if the Chambers decide that they shall be razed

# The Architect.

## SMALL SUBURBAN HOUSES.

SO very many people are interested in the occupation of the various kinds of small houses, that the contrivance of their arrangements ought to be perhaps the most important of all architectural subjects, but for the quiet and accommodating character of the inmates. The comparatively few who have the happiness of being able to live in habitations of higher class are not so quiet and accommodating. We might almost say, the better the house, the louder and more unreasonable are the complaints about it. To hear and read the denunciations of the dwellings of the upper ten thousand which are so common, a stranger to the peculiarities of English civilisation and the freedom of English opinion might be excused for supposing that our architects and builders must be literally the most astonishing blunderers that the world has ever seen. Indeed, he might feel not quite sure whether their misconduct is not intentionally malicious, or at the least so grossly negligent that the suggestion might seem only reasonable which we remember to have been made by a lively writer on the subject a year or two ago, apparently in all sincerity, to the effect that persons offending professionally against the doctrines he was advocating ought to be laid by the heels in the House of Correction. It may be a relief, therefore, to some of our readers, surfeited with the woes of rich householders, to turn to the condition of a humbler class.

A spirited little work, published recently under the title of "Our Homes, and How to make them Healthy," in giving an account of the small suburban house—that is to say, "an ordinary house of perhaps 30*l.* per annum rent, in any one of the new thickly-populated suburban districts which a few years ago were lanes and fields"—describes it in the following racy manner. We shall be obliged to translate somewhat freely, of course, and, indeed, to help out the writer in a way which, with amateur critics of building, is always desirable; but the reader will see that there is no need for exaggeration even if we were disposed to indulge in it.

The front door of our small suburban house, says this author, leads into a "hall" 3 feet wide at the utmost, which, but for the door being sometimes open, is generally devoid of both light and air. In those rare instances in which the gloom has been diminished by the introduction of a fanlight over the door, this is fastened up, and so made at least secure against that ventilation which would otherwise try to reach the passage and the staircase. The front parlour has a bay window, which, it is true, by means of flower pots, might have a pleasant effect, were it not that the mouldy smell and the stained walls are (in an uncomplimentary sense) much more attractive to the visitor. The cause of the mouldiness and damp is well known; the eventual effect is dry rot; a damp-course is then inserted at a disproportionate cost, and the ground under the floor dug out and a bed of concrete laid down. The back parlour is wofully restricted in width, as in outlook, for the sake of a wing behind, which contains the kitchen. This kitchen is made of the smallest size and of the lowest height, because of its greater need of ventilation. Swarms of black beetles, however, obtain access from innumerable crevices in the floor and the plaster. When these confiding guests are inhospitably slaughtered, the process of their decay makes matters only worse; and no one seems ever to think of putting down even a floor of concrete or of wood-bricks to keep the beetles out. The scullery is only a dark and damp recess containing a sink. Side by side with it we have a water-closet and a larder; and these incompatible conveniences have "carefully-arranged facilities for ventilating the one into the other." A few feet off is the dustbin, and the ground floor is complete. Upstairs are the bedrooms of the establishment, with not unfrequently a bathroom. "Care has been taken to render them as pervious to rain, and as susceptible as possible to changes of temperature." The staircase, also, not only is squeezed together to a miserable minimum of size, but it is made expressly dangerous to life and limb by being formed almost wholly with

winding steps, besides being nearly perpendicular. "The utter disregard of the possibility of a house of this kind being ever inhabited by children is a curious and noteworthy fact." The need for cupboards is especially ignored. There is, again, an "utter disregard of the simplest possible rules of sanitary science in the drainage arrangements." Lastly, "notwithstanding the complaints which assail the builder on all hands," the whole misadventure is repeated and perpetuated without remorse; and this is a fair description of a small suburban house.

Now, with all respect for one who is evidently as earnest a philanthropist as such writers generally are, however deficient in information and judgment, we cannot help saying that this is by no means a skilfully drawn picture, or even an intelligent statement. True, 30*l.* a year is a low rent, especially if 6*l.* of it has to go for the ground, as it often has, if not more. The building outlay cannot well be much more than 250*l.* by the time the lawyer and surveyor are paid for procuring the money and controlling its expenditure; to say nothing of the circumstance that all the materials have to be got at prices which, in spite of the most parsimonious administration, must be considerably augmented on account of doubtful credit and more than doubtful risk. Even at fivepence per cubic foot it is questionable whether the accommodation described could be squeezed in anyhow, especially if the house—we will not suppose it to be a semi-detached villa—has its little iron railing in front and its little "back-garden" behind. But instead of wasting time in the vain endeavour to imagine what a house worth only 30*l.* a year ought to be, let us describe what is actually being built in the suburbs of London for a slightly higher rent, and we think it will be the opinion of most readers that our speculation builders, instead of being hastily charged with incorrigible and wilful obtuseness and perversity all round, may be complimented just now upon their manifesting here and there, in fair rivalry with each other, what promises to be the beginning of a much improved practice in small houses.

In the first place, the damp course and, where necessary, the concrete bed under the floor, are now compulsory by law, and so far the public surveyors can take the direct responsibility of preventing the neglect of those important primary precautions. But we have reason to hope that the still happier effect of legislation in this direction will be to cause builders to understand for themselves the reason why the new law has been made, and of their own accord to attempt even more than the law can strictly compel them to do. Better bricks and better mortar are also being used, for the same reason that the legal regulations have now been made more clear. The drainage, again, is much better ordered; and the sanitary plumbers are vastly improved. All this, moreover, is accomplished without the need of involving the speculation in any material increase of cost. Regarding the mere plan of the house, it is impossible to do otherwise than constitute a front room and a back room the leading features of accommodation; and where there is no basement (an important point in respect of household economy in such small establishments), there is nowhere else to put the kitchen except at the rear as a wing. It is idle to despise and ridicule this simple plan, for such simplicity is the outcome of experience and the test of merit. But what we now discover, if we go to the proper quarter, is the introduction of a certain amount of that ingenuity in the details of accommodation, without compromising the principle of plan, which makes all the difference in such matters between the silk purse and the sow's ear. Instead of the dark passage or the fixed fanlight, there is a somewhat elegant entrance door with ornamental glass panels, sunk in a little recessed porch which adds both convenience and elegance of its own; and, in any one of half a dozen ways, the staircase is not only easy of ascent and descent, but well lighted, and, if no wall window can be had, sufficiently ventilated by some other means. The little kitchen is sometimes a miracle of neatness, and its appurtenances and appliances, although on the smallest scale, are almost laughably complete and inviting. The tiny forecourt and the tiny garden behind, actually capable of cultivation both, are in their way perfect; and the tile pavement up to the front door—we beg its pardon, the porch—and the little bit of asphalt paving at the back door, or rather the garden entrance, add final touches of grace to the *ensemble* which are worth ten times the money. It is lamentably true that the coals have frequently to go in through our elegant porch, and the dust to come out by the same way; but there are several ways of avoiding this if a little more land or a little more

money can be allowed; in either case, of course, meaning a little more rent. Then the dining-room—emphatically not the “front parlour”—is easily enough made fit for a prince, if it were large enough, with its nice bay-window, its fashionable wall-paper, dado included, cornice and ceiling in tints *à la mode*, joiner’s work to correspond, and floor margin stained and waxed, every item all the more charming that it is cheap. The “back parlour” of old is the library—sometimes indeed the drawing-room—and equally full of undeniable little graces. Nor are the bedrooms any longer of the anyhow type, with thin framed partitions, halfpenny papers, partnership windows, and so on, often chimneyless, always corniceless, and too frequently with no place at all for the bedstead except across the fireplace or under the window; but, granting their small dimensions in cases where this cannot be helped, they are as snug and pleasant as if they were in a palace. The bath-room—with a surprisingly short but quite efficient bath, and just room to turn in besides—has its polished mahogany frame, marble washstand, plated mountings, varnished paper, proper sash-window, and—what more could any one desire? Cupboards there are throughout, notably one of them as a formal linen closet; the stoves are of the latest invention as well as of the smallest size, and the range is a model; the chimney-pieces are sometimes almost too neat; and the fastenings and “furniture” are good instead of bad. For 40*l.* or 50*l.* a year such a dwelling as this can now be had almost anywhere round London, and no doubt for about 30*l.* one of the same pleasant order of thoughtful design, a little more limited in accommodation and finish. In many cases, we may add, the hand of the skilful architect is plainly to be seen; and if in others it is not so, this seems to be only a matter of fallacious economy which time is sure to mend.

We are therefore proud to be able to compliment our smaller builders on the spirit of enterprise in this important direction which is now animating them, and we confidently expect to see their work more and more improved as the public taste improves—which it is doing every day.

### INDUSTRIAL ART EXHIBITION AT GHENT.

A VISIT to the Flemish city of Ghent seems to take one back directly into the Middle Ages, and the statue of VAN ARTEVELDE, by DEVIGNE-QUYS, in the Place du Vendredi, is so full of fire as to almost recall the famous speech in which, in 1344, he succeeded in persuading the burghers to take part with England against France. The birthplace of JOHN of Gaunt, time-honoured LANCASTER, was, during the reign of CHARLES V., the most populous town in Europe, thus warranting the Emperor’s celebrated pun to FRANCIS I. of France, “Je mettrai votre Paris dans mon Gand (gant).” The Cathedral of St. Bavon, which has the most highly ornamented interior of any church in Belgium, contains four large brass candelabra bearing the English arms, which were probably purchased from St. Paul’s, London, during the Commonwealth. The Hôtel de Ville possesses a picturesque façade in the flamboyant Gothic style; built between 1481 and 1533, after the plans of D. VAN WAGHEMAKERE and ROMBONDT KELDERSMANS, and is perhaps the finest specimen of its kind in the country. The *beffroi*, or belfry, which, according to an endorsement on the original plan still preserved in the city archives, must have been begun in 1183, is surmounted by a gilt brass dragon, 10 feet long, taken from Constantinople by BALDWIN IX. during the fourth Crusade, and now serving as a weathercock. It was from the top of this tower that CHARLES V. uttered another memorable pun on the name of the city. When the cruel Duke of ALVA urged him to destroy the proud city that had given him so much trouble, he asked, by way of reply, “Combien faudrait-il de peaux d’Espagne pour faire un gant (Gand) de cette grandeur?” The *carillon* consists of forty-four bells, one of which was pierced by an Austrian cannon-ball in 1789, but without its tone being injured. The old gateway of the castle of the Counts (of Flanders), not far off, dating from 1180, is another interesting relic.

Ghent was early distinguished both for its fostering of art and for its manufacturing enterprise, and the members of the *Chambre Syndicale des Arts Industriels* are worthily carrying out the high mission handed down to them from the ancient guilds. In 1877 they held their first exhibition of industrial art in the University, and have instituted each year subse-

quently various competitions with the object of infusing beauty into articles of everyday life. This year, besides the usual competitions, they have organised their second exhibition, which was opened on August 28 in the Casino, and will be continued until October 16. The handsome building, which was erected in 1836, having an iron roof, lighted from above, and painted entirely white inside, admirably sets off the treasures it contains. A large palm tree and ferns in the centre are surrounded by the busts, contributed by the *Compagnie Générale des Bronzes*, of men famous in art-history. There are JORDAENS and VAN RUYSBROECK the painters, COLIN the sculptor, and CONSCIENCE the Flemish novelist, alternated with modern *chefs-d’œuvre*.

The exhibition is divided into two parts, Ancient and Modern. The retrospective portion is restricted to objects, anterior to the nineteenth century, connected with Belgian or foreign art, and includes some rare gems. There are tapestry, silver plate, porcelain and pottery, ivory and oak carvings, miniatures in enamel, caskets, cabinets, locks and keys, hinges and escutcheons, arms, fenders, dogs and fire-irons. What attracts the most interest, however, is the reproduction, with the actual articles of furniture and utensils, of an old hall. The fireplace, bearing the date of 1534, has its iron back-plate and elaborately-forged dogs, terminating in baskets for containing the hot embers. The tongs, warming-pan, and lanthorn are evidently of the same period; while the carved and leather-seated chairs are thoroughly in keeping. It is almost worth a visit to Ghent if only to see this old fireplace.

The modern portion of the exhibition is subdivided into five sections, viz. (I.) Building; (II.) Furniture and Decoration; (III.) Metal-work; (IV.) Textile Industry; and (V.) various industries; in all of which silver-gilt, silver, and bronze medals will be awarded by the jury. The Building section includes (1) ornaments in stone, carton-pierre, plaster, and artificial stone, such as decorative groups, consoles, balustrades, pedestals, &c.; (2) natural and artificial marble-work, and marble, mosaic, ceramic, and cement pavements; and (3) joinery, including doors, parquetry floors, &c.

A few of the objects may be noted. In Brussels and other towns of Belgium holes are left in the walls of houses, just under the eaves, to receive poles from which to suspend a scaffolding for the yearly painting or lime-washing of the fronts; and these holes are generally filled up by ornamental plugs, which rather improve than detract from the appearance. M. CH. LABEEUW, of Laeken, near Brussels, shows some lions’ heads, with their framing, executed in compressed cement, forming a good arrangement for this purpose. M. GUILLAUME MEWIS, Brussels, who obtained an industrial decoration in 1880, sends three small but well executed busts in terra-cotta, representing Spring, Summer, and Winter; and M. VAN WEYDEVELDT, professor at the *Ecole Industrielle*, Bruges, contributes three plaster ornaments modelled by the pupils.

The exhibits in the second group are almost entirely confined to paving-tiles and marble mantelpieces. Of the former, LÉON DE SMET ET CIE, Ghent, show a trophy with every variety of paving-tiles in compressed and polished cement, with the portions forming the pattern let into the body of the tile. Near it M. TH. COCQUIT, Ghent, shows his new and patented moulds, dies, and press for producing such tiles. MM. DAMMAN and CASSARD, Brussels, show specimens of a new flooring, for which they justly claim many advantages. In the first place, a floor of hard flags, with conical holes, is laid in cement. On this is spread a damp-proof substance, in which the portions of wood forming the parquetry are laid, having grooves formed in their underside, constituting a dovetail which keys the whole together. There is then no space left for rats, mice, or insects: and the noise of footsteps is deadened. This flooring is laid, among other public buildings, at the new Palais de Justice, Brussels, which is now fast approaching completion. Among many mantelpieces must be mentioned those of M. J. J. LEFEBVRE, Ghent; two in black marble, Renaissance and Louis XVI., by M. CRAB VAN DEN BOSSCHE, Brussels; one in black and blue marble, Renaissance, by M. J. DE VRIESE-ROMYN; one of black marble inlaid with Italian griotte, by M. L. PARMENTIER, Basècles; and another, handsome in its plainness, executed in the blue stone, or “petit granit,” of the country, Flemish Renaissance style, by MM. TRIGALET and DELTENRÉ, of Ecaussines. There are but few entries in the third group of building, joinery; but M. E. SUY, Ghent, shows a good specimen of forty veneers cut in an inch thickness by his special system.

As Section II., Furniture and Decoration, lends itself so readily to effective display, it is naturally the best filled of any. In the first group (decorative painting on stone, wood, and cloth, and imitation of wood and marbles) there are thirty-five exhibitors, who show, for the most part, panels painted in imitation of Gobelins tapestry. M. J. ALLO, of Brussels, also sends a composition in this style for the space over a mantelpiece. M. G. CAMBIER contributes a remarkably spirited painting on cloth, illustrating a "*Prælium tauri in circo Romano*;" but it is killed by the glaring ecclesiastical figures of another exhibitor injudiciously arranged just in front. M. JULES LEFEVRE, of Ghent, exhibits reproductions of VAN ORLAY'S *Grotte de Calypso* and TENIERS' *Rainbow*, with a border for imitation Gobelins tapestry, intended for the Amsterdam Exhibition of next year. M. CONSTANT MONTALD sends designs for the painted roofs of a theatre and a concert room.

The second group, Cabinet-work, is rich in meritorious works. M. F. ALLEWAERT, of Ypres, exhibits a cabinet of solid ebony, inlaid with ivory and various woods, with painted panels, valued at 140*l*. M. BEAUFAYS, Ghent, sends an oak table, with parts inlaid with the same, but with the grain running in a different direction; while a sideboard is similarly ornamented besides being carved. M. L. BLANCHART, of St. Denijs-Westrem, sent an oak "*dressoir*," desk and chairs, simply *caré*, but with the elaborate hinges fixed over red-cloth showing an edge, which produces a good effect. M. VAN ASSCHE, Ghent, has a similar exhibit adjoining, his *dressoir* of the fifteenth century having a canopy. Three rooms erected against the wall on one side of the building claim special notice, viz. a dining-room, the cabinet of an antiquary, and a bed-room, all fitted up complete by various firms. A reproduction of an old Flemish fireplace, with the top portion in carved oak, is decorated with copper panels, sea-pieces in tiles and brass castings, while the inscription

Sunt tria damna domûs, imber, mala fœmina, fumus,

slightly transposed to equalise the spaces, runs round the cornice. The bed-room furniture is of oak in the Gothic style, with two chairs in Flemish Renaissance. The carved oak furniture in imitation of the antique by M. ROEGIERS, antiquary, Ghent, is very fine; M. EMILE LEBRUN, Ghent, also contributes the furniture of a dining-room. M. PELGRIM, Brussels, shows dining-room furniture, including telescope table with some small mouldings coloured a deep red, which produce a striking effect. M. F. ROSEL, Brussels, has also erected a drawing-room with reproductions of ancient furniture and decorations. Under the marble mantelpiece with ebony top there are brass dogs and hand-irons. The walls are covered with cloth painted in imitation of tapestry; and a cabinet has nickel hinges. Unless these, however, be taken to represent polished iron, they must be regarded as an anachronism. M. PH. J. TAELEMANS, Brussels, has sent two sideboards, one of which, in black wood with painted porcelain panels, affording a strong contrast, is effective; the other, already sold, forms part of the furniture of a dining-room, now being actually carried out with *cheminée* up to the ceiling and wainscotting, two mètres high. M. VAN HENDE, Ghent, contributes the furniture of two bedrooms, one Louis XV. and the other Louis XVI. The combined desk and cabinet of M. MATTHIAS ZENS, Ghent, in carved oak, is most imposing.

The third group is devoted to frames, and includes some excellent specimens of gilding produced by a chemical process. Group 4 comprises pottery, porcelain, and glass, with a special view to their decorative effect. *Facile princeps* in this department comes Madame VERMEREN-COCHÉ, Brussels, made Chevalière of the Order of LEOPOLD on account of her industrial success. A special pavilion contains some *chefs-d'œuvre* of ceramic art, the walls being decorated with reproductions on common earthenware of the works of ancient masters. VANDYKE'S *Christ on the Cross* is painted on a slab 32 by 20 inches, which was very difficult to burn on account of its size. RAPHAEL'S *Madonna della Sedia* is reproduced on a concave surface, with tone, colour, and design all good. TITIAN'S *Assumption of the Virgin* is also successfully copied. There are portraits on a gold ground to imitate those of the Gothic period, and fancy heads that might have been painted by TENIERS or REMBRANDT. A miniature of *La Cruche cassée*—not that of GREUZE, but with two figures—is most minutely executed. Three large round dishes were painted with allegorical subjects before being burnt; the consequence is

that they have a sketchy appearance. A dessert plate, painted by hand with an effective *grisaille*, is marked at the remarkably low price of 10 francs; but there is another, minutely decorated in the Renaissance style, with blue ground, and bearing the cipher of the establishment in the middle, valued at ten times that amount; while two round earthenware dishes, 25 inches in diameter, painted very successfully on enamel, one with roses and the other with grapes, are priced at 150 francs each. Everything exhibited is artistic and produced by hand, and new effects and combinations are continually being produced in the *ateliers*. This year the specialty consists in platinum and three different shades of gold; and another new effect is obtained by barbotine on porcelain, giving a relief to the ornaments, which is most effective. The painting on porcelain by three ladies happens to be arranged adjoining one another, illustrating three different styles. Madame NOËMI HEMARD, of Verviers, shows flowers and fruit, which, notwithstanding the practical difficulties with vitrifiable colours, are painted with absolute fidelity to nature; Mdlle. MARIE WODON, Brussels, evinces a style in which, however, nature is sometimes sacrificed; and Mdlle. MARIA GASPAROLI, of Ixelles, attempts realism, and even caricature.

The fifth group of decoration comprises painted and engraved glass. M. A. DE SAEGHER, Brussels, contributes two mirrors with bevelled edges, ornamented with polished brass in the Renaissance style, reproduced from ancient types. MM. STALINS and JANSSENS, Antwerp, send two windows in the same style, representing Poetry and Music, forming part of a series of five, of which the others will represent Painting, Architecture, and Sculpture. M. VAN CROMBRUGGHE DE KEUTRELAERE, Ghent, shows, amongst other ecclesiastical subjects, the fragment of a window intended for Everghem Church. The sixth group, wall-papers, including some in imitation of old leather, completes this large class.

In Section III. Metal Industry is subdivided into four groups, of which the first two represent jewellery and religious goldsmiths' work respectively. The third group—art bronzes—is chiefly represented by *repoussé* salvers and "suspensions" or pendent lustres for gas. Among the former, M. CHARLES ROSSIGNOL has sent eight brass plates showing the successive effects obtained by the chisel and hammer alone, without dies. A work of high art is his *jardinière* in the Pompeian style. M. A. ARENS, Antwerp, had a very fine show of small articles, including *repoussé* portraits in carved oak frames, *repoussé* plates representing the Kasteel van Laer and the Heerlykheid ten Esseche, both seigneurial edifices; old brass panels, mirrors in metal frames, and caskets in *repoussé* iron and cast brass. M. H. DE BUCK, Brussels, sends six lustres in brass *repoussé* work executed in the lathe. MM. LONGUEVAL ET CIE., Brussels, have on view lustres, "suspensions," clocks, a Renaissance *jardinière*, and two vases representing BELLEROPHON and TERPSICHORE. M. FELIX VAN DE VELDE, Brussels, exhibits some remarkably handsome Gothic lustres, fire-dogs, &c.; and M. J. SCHONJAUS, of the same city, lustres in various styles—Renaissance, Louis XVI., and Jewish, in which latter the gas-jet forms an angle of about 45 degrees with the vertical, throwing no shade; the brass is also variously tinted. M. GALANNEAU shows two plates of polished brass, both painted, one with a moonlight scene and the other with red flowers.

The principal exhibitor in the fourth group of this class—artistic wrought-iron work—is M. L. WUYTS, with his four anchors for buildings, American oak and fuchsia, all beaten out of iron. M. P. MESTDAGH, Antwerp, has mounted his weathercock, which serves as lightning-conductor at the same time. M. J. B. FONDU has reproductions of old Flemish fire-irons, a pavilion with nickelised locks of his invention, and a number of different locks capable of being opened at once by one master key, a new invention.

The limits that this notice has attained oblige us to dismiss Section IV., Textile Fabrics, with the observation that several firms show cretonne for hangings in subdued colours, but rendered rich by the introduction of a gold thread. In Section V., Miscellaneous, there are many capital specimens of printing, bookbinding, and illumination in imitation of the antique; and one firm sends playing-cards in the styles of all countries and of forty-seven different types.

Mention must not be omitted, however, of some ingenious sun-blinds shown by M. NICHOLAS BULENS, of Brussels, which may be pulled up and down by an endless cord without rack or weight, a spring on the end of the roller giving sufficient brake power to keep them in any position to which they may be adjusted.

The special competitions of this year are well contested ; and it is only in rare instances that the prizes are withheld. These are designs for a Renaissance mantelpiece for smoking-room ; a commemorative monument to the founder of a charitable institution, the cost not to exceed 200*l.* ; a single-lantern lamp-post for the streets of an important town ; a bookcase for an archæologist's office ; a modern cabinet decorated with mirrors ; a *glace sans tain* for landing window ; a pulpit for church of fourteenth century ; a gas girandole for church of thirteenth century ; a drawing-room carpet in seven colours ; and a centre piece in form of basket, not to exceed 48*l.* in cost. The second series of executed objects, are :—The furniture and decoration of the office of a large industrial establishment, with desk, chair, *casier*, and bookcase on castors ; a *jardinière*, 24*l.*, for a landing ; a Renaissance dining-room table in oak, not to exceed 28*l.* ; four chairs of the value of 10, 20, 40, and 75 fr. respectively ; porcelain table-service ; table-cloth and dozen napkins ; church lamp ; art binding to a quarto book ; an octavo binding for 4*s.* ; and a sledge.

This interesting collection has been got together mainly through the exertions of the President of the *Chambre Syndicale*, M. C. VERHAEGHE DE NAEYER, and its indefatigable secretary, M. EMILE VARENBERGH ; while M. O. VERSAVEL is the commissioner specially delegated to superintend the installations. All may be sincerely congratulated on the result achieved.

### FRANCOIS BOUCHER.—II.

(Concluded from page 139.)

BOUCHER was the first French artist whose sketches were purchased and eagerly sought for by the public. WATTEAU, LANCRET, and OUDRY, &c., made the sketches of their paintings on the back of a copy-book or any other smooth surface which was nearest to their hands. These were sometimes nailed against the walls of their studio, and unless preserved as a souvenir by some friend, or sold at their death among their books and furniture, they were inevitably lost to posterity. To BOUCHER it first occurred to sell his original drawings, which were eagerly secured by amateurs to adorn panels in the boudoir of a court beauty, or bought by collectors such as JOULLAIN and BASAN, who gave enormous prices for them, because of their intrinsic value. BOUCHER composed a sketch with as much ease as though he had entered the world pencil in hand. He usually drew with chalk, touched here and there with *sanguine*, on grey or yellow paper. He produced designs of mythological subjects which have been mistaken by connoisseurs for CARACCI's. With a few strokes of his pencil we have a marquise, her brocade train broken into a thousand folds, her point-lace collar simply indicated by a few touches ; the sketch, however, is executed with a skill which brings the figure clearly before us. But few water-coloured drawings exist of BOUCHER's. M. DE GONCOURT possesses one of these *rare aves*, of which the subject is a shepherdess seated beneath a tree, and placing a rose a shepherd has just gathered in her hat ; a goat and sheep are in the foreground. M. DE GONCOURT owns also fourteen of BOUCHER's drawings on grey and on yellow paper—one of these done in pen and ink, touched with bistre, on a ground slightly rubbed in with red chalk. All are signed, and on the back of some among them is written the various sales at which they have been purchased. For example, there is one on yellow paper, drawn in the three chalks, of which the subject is a young woman in a Spanish costume holding a fan, signed BOUCHER, 1750 ; and there is further inscribed on it, "This drawing formed part of the NIEL collection, and was sold in 1781 at the SIREUL auction for 123fr. to M. DULAC." Another drawing has for its subject a young girl clad in a chemise ; she stands at the edge of a river, preparing to bathe, her arm resting on the shoulder of her companion, around are Amorini sporting with a swan. This has been etched by HUGUIER as *Vénus au bain*, for a frontispiece to the third volume of "Sujets et Pastorales, par F. BOUCHER, peintre du Roy." A *facsimile* of it is also reproduced by DEMARTEAU, No. 345.

Models were unknown to fame in the eighteenth century. Old DOYEN writes in considerable anxiety as regards his son's morality in view of his studying these dangerous personages, but of their names we have no record. COCHIN's amusing engraving of *Students at the Academy* gives us the model of the day in a skirt *falbalassée*, beneath which a high-heeled shoe is visible : her head is surmounted by a crown ; she is

sitting for a *tête d'expression*. There was one, however, whose name has descended to posterity in the scandalous annals of the day, to whom we have already alluded. The anecdote regarding her is of the period which explains its crudeness. MURPHY was sister of the Academy model, at whose death she succeeded to the place. Madame DE POMPADOUR, wishing to attract the King's attention to this fresh young beauty, had her painted in a Holy Family for Queen MARIA LECZINSKA's oratory, where the King daily heard mass. The scheme was crowned with success. BOUCHER's model had the honour of inaugurating the *Parc aux Cerfs*. She was the last model BOUCHER employed. Sir JOSHUA relates that when he visited BOUCHER in Paris he found him painting without a model, at which REYNOLDS expressed surprise ; BOUCHER told him that he had not for many years employed one.

It is but a few years ago that an old house close to the Sorbonne existed which had belonged to the engraver DEMARTEAU. The exquisite painting which decorated it proved BOUCHER's gratitude to him for the skill with which he reproduced his drawings and paintings. BOUCHER had painted the walls of the drawing-room, and a prince would have envied the possessor. A trellis-work covered all the space save that contained in four panels, filled by delicious scenes of country life ; over the doors Amorini, playing with the water of a fountain and eating fruits, were executed *en camaïeu* and surmounted by doves ; the whole effect of the decoration being that of a lovely country in the midst of summer.

BOUCHER's industry was amazing. He had more orders than he could execute, yet he found time for painting fans and even the panels of carriages. Madame DE POMPADOUR, who was not only his patron but his friend, consulted him as to the decoration of the various palaces she induced the King to erect for her accommodation. Her Chateau de Crécy was adorned by his paintings. The chapel of her chateau at Bellevue was the production of his genius. She it was who ordered the allegorical subjects *Eloquence* and *Astronomy* for the Medal Room at the Bibliothèque Royale, where these fine works still exist. They were exhibited with two others, *History* and *Science*, subsequently painted as pendants, at the Arts Décoratifs in 1880. The *Forges de Vulcain* was ordered by Madame DE POMPADOUR for the royal bedroom at Marly ; she likewise purchased his two largest and finest works, *Sunrise* and *Sunset*, which she presented to LOUIS XV. Madame DE POMPADOUR commissioned BOUCHER to paint her portrait in full dress. LA TOUR has painted her in pastels, which portrait is in the pastel-room at the Louvre. BOUCHER's portrait—the finest he ever executed—was exhibited at the Alsace-Lorraine Gallery in 1872, and will be fresh in the recollection of many. The Marquise, in a robe of turquoise blue, silver lace, and roses, supported by a cushion of nankeen silk, is seated in a library ; a portfolio of drawings and engravers' tools are beside her ; a roll of music, a King Charles spaniel, and some half-blown roses are at her feet ; a writing-table and book-shelves, reflected in a mirror, are in the background. Madame DE POMPADOUR, to whose initiative France owes the Sèvres manufactory of porcelain, was not only an art patron, but was herself no mean artist. Gems engraved by her are preserved in the jewel-room of the Bibliothèque, and the style Louis XV. was mainly the creation of her taste. It was due to her influence that BOUCHER was selected to direct the manufactory of tapestry at Beauvais founded by COLBERT, but which had fallen into disrepute in consequence of its neglected condition, and in June 1755 BOUCHER was appointed to supersede OUDRY in the direction of the Gobelins manufactory, for which the Marquis DE MARIGNY, Surintendant des Beaux Arts, received the thanks of the artists employed at the Gobelins on account of BOUCHER's extreme popularity. Madame DE POMPADOUR's influence survived even her death. On September 8, 1763, BOUCHER received the King's commission, in virtue of which he was appointed to succeed CARL VAN LOO, demised a few days previously, as Premier Peintre du Roy. The document is signed by the King. Two years later the Academy of St. Petersburg elected him Associate, and the Academy of France appointed him Director. FRANÇOIS BOUCHER was somewhat old for this latter position, and the spoilt favourite of fortune neglected the duties of the office. Fortunately for the students, COCHIN, to whom VAN LOO had left the direction of the classes, did most of the work for BOUCHER. Meanwhile the finances fell into confusion, the Academy models complained that their salary (24*l.* a year) was not paid, neither were the poorer students, who depended on the charity of MICHAEL VAN LOO

for their dinner. The result of this careless superintendence was that once more the annual Salon was on the point of being closed from lack of funds. DIDEROT, not unwilling probably to cast a stone at BOUCHER, gives a pitiable account of the state of things in "Salons d'Exposition," republished by BELIN, Paris, 1818. BOUCHER was making 2,000*l.* sterling by his paintings, and, secure of Court favour, cared not what the Encyclopædists wrote. In 1766 BOUCHER accompanied M. DE BUSSET on a visit to Holland for the purpose of studying RUBENS in his own country, but with this exception he never absented himself from his studio, in which was a perfect museum he collected of precious stones, such as malachites, jaspers, agates, amethysts, crystals, as likewise of rare shells, coloured marbles, and foreign woods, for the purpose of studying the effects of colour in the productions of Nature. After his death this collection, valued at four hundred pounds, sold at a higher price. LUNDBERG's pastel of BOUCHER, now in the pastel-room of the Louvre, gives an admirable idea of the prosperous artist in his *atelier*—a pleasant smile on his countenance and a penetrating expression in his eye. ROSLIN painted him for the Academy in his court dress of dark-coloured velvet with lace chitterlings and ruffles. The engraving of this portrait by SALVATOR CARMONA conveys a charming impression of the old artist. An anecdote of the time testifies to the kindly nature of the man. VIEN had been twice refused admittance to the Academy. The second refusal broke his heart. BOUCHER went to see his rejected picture, and at once told him he would never again cross the threshold of the Academy if he were not at once received. In 1767 PIGALLE (the sculptor) and LEMOINE intrigued to prevent MILON, an able artist, from obtaining the prize due to his merit. On the day of the distribution of prizes the students, ranged in double file outside the Academy, turned their backs to the Academicians as they came out, after this decision; but when BOUCHER appeared they cheered, and even attempted to carry him in triumph round the square. BOUCHER had but one son, who became an architect, but who did not inherit his father's genius. His eldest daughter married DESHAYES, an artist of singular talent, who died at thirty, to the grief of his father-in-law. Madame DESHAYES survived her husband only a few months. BOUCHER's second daughter married BANDOIN, whose *gouaches* rival those of FRAGONARD and almost equal BONINGTON. BOUCHER also lost this son-in-law, of whose talent he was naturally extremely proud: BANDOIN died 1769. The old man was attacked by asthma, but painted to the last hour of his life; an unfinished picture, intended as a gift to his physician, was on his easel the day of his death, May 30, 1770. He was buried at his parish church of St. Germain l'Auxerrois; the register of his death is signed by his son, VIEN, VANLOO fils, and PIERRE the artist, &c. The complete catalogue of the thousand pictures he painted is published in M. DE GONCOURT's "Art au XVIII. Siècle," to which we are indebted for much of our information.

#### ARCHITECTURE IN AMERICA.\*

THE needs of no one time exactly resemble the needs of another, and it would be absurd to expect the late nineteenth century to find itself completely at home in the houses of the eighteenth, or even in those of its own earlier years. This, that we are living in, is a time of universal self-indulgence and love of ostentatious display; and how could such a generation content itself in the houses of its poor and ascetic ancestors?

But, while one generation differs from another in this, that, or the other superficial characteristic, all generations are alike in substantial, and it is in substantial that we can learn from the architecture of our forefathers. It was in a sense of proportion, of picturesqueness, and of comfort, that the old builders excelled; and it is in a sense of proportion, of picturesqueness, and of comfort, that our builders and architects are particularly wanting. There is, however, one important fact to be remembered. What we now are obliged to ask others to do for us, our forefathers used to do for themselves. We have no mention of the arrival of the first architect on these shores, but he was at least one thing that did not come over in the May-flower. Better-informed persons than I am will know whether the old buildings of colonial and revolutionary times were designed by professional architects, or were the work of mere builders; but I believe there can be no doubt that the handsome houses in Gloucester, Portsmouth, Hingham, Cambridge, and other Massachusetts towns—the houses that made old

New York so dignified a city, and those that still give to little Newport an air of consequence; or those, again, to which some of the New Jersey towns and cities owe their ancient aspect, that makes the frequent discoveries of mastodons and other fossils in the soil seem quite in keeping—there can, I believe, be no doubt that all these houses were the work of simple "builders," who knew their trade and ever cared to give themselves a finer name. And what is true of these houses and churches is also necessarily true of the cottages and small houses; for if architects had been needed to build the better sort of structures, the lesser sort would never have been so good as they are. The general excellence that marks the dwellings of any people is a proof of the non-existence of professional architects among that people. Where architects abound, the art of building always deteriorates. Did architects design the houses of Venice? Architects may have designed the bad ones, but never the good ones. As soon as architects got themselves fairly established in Venice, her shabby days began. But, to take more humble examples, consider the cottages of England, the chalets of Switzerland: is it not evident that they are the spontaneous outgrowth of a general good taste that stood in no need of "assisting." And even in England, where the profession of architecture, owing to the great patronage of the noble and wealthy classes and of the Government, has reached a high condition of skill and technical taste, everybody must have remarked the incongruity between its productions at the best and those of the older people, created before there were any architects other than clerical and monastic amateurs.

Every old church in England looks built by the same hands that built the old houses that nestle about it; or, rather, church and houses look as if they had not been built all, but had grown, and grown out of one root. Let the best architect in England try to replace one of these old churches that may chance to have been destroyed, and, no matter how familiar he may be with the architecture of the period to which the old church belonged, the new one will look like an interloper.

It is to architects that we owe all the ugly building that offends us in our large cities and in our country towns and fashionable summer quarters. And I will grant that it is to architects that we owe, nowadays, the few—the very few—buildings on which our eyes can look with any pleasure. The work of the professional builders is always in these days an eyesore, but the builders simply follow the patterns set before them by the architects. A builder must call himself an architect before he can be employed in any important work to-day. The man—I forget his name—who built Mr. A. T. Stewart's house and iron shop, and many a structure beside, was called an architect. Architects, too, are responsible for the churches on the Back Bay lands of Boston. An architect built the one with the foolish frieze of sculpture encircling the lofty, awkward tower, and wholly unintelligible from below! Costly sculpture—ugly and unintelligible, it is true, but costly for all that, and by Bartholdi, a man whose works seem by some fatality to have been unloaded upon this bedeviled land, as if we had not sculptors enough of our own, quite capable of work as bad! And this sculpture is put, as I say, at the top of a lofty tower, where no human eye, unless armed with spy-glasses, can make it out—a proceeding not easily reconciled with one's notions of Boston, where, if anywhere in the country, the laws of æsthetics and the limitations of the art are supposed to be understood at least, if not spiritually discerned. And another architect built the church in that Back Bay quarter, dedicated, we suppose, to some female saint, since it has for emblem on the top the completest Saratoga trunk—to what end, unless an emblem, no mortal could ever tell me, nor I by my unaided wits discover. An architect also built the Art Museum, so finikin fine, with its heads of great men looking out of port-holes in the most shipwrecked fashion; a senseless treatment, although borrowed from that overdone Pavian Certosa, where so much is to be seen treated in an extravagant, ostentatious manner. This particular extravagance—medals run mad, as it were—seems to have taken hold of the fancy of certain of our architects; we find it repeated again in the Sanders Theatre at Cambridge, and in the Historical Society's building in Brooklyn, where that good sculptor, Mr. Olin L. Warner, has been called on to design the heads of the shipwrecked personages. If I cannot like the outside of the Boston Museum, it is the outside alone that vexes me. Wholly pleasant are the contents, and the management every way creditable to Boston; a Museum of Art, with actually the collection of art material its chief object, and a generous courtesy presiding over its management. But Boston has been as unfortunate in her architects as New York, though in quite another and, it may be thought, in a more creditable way. The Museum of Fine Arts and the Memorial Hall at Cambridge, for instance, are examples of what comes of building getting into the hands of literary, critical men, art students, with their heads crammed full of remembered bits of Old World architecture, and their portfolios stuffed with photographs of more and more bits. Even "Trinity," the most effective piece of building yet done in America—and Mr. Richardson is one of the few men, alas! how dolefully few, who have the stuff of a real architect in them—even Trinity owes two-thirds of its external impressiveness to its tower, borrowed almost literally from the tower of the Salamanca Cathedral. Borrowing, borrowing everywhere; an original motive almost

\* From an essay by Mr. Clarence Cook in the *North American Review*.

impossible to find. For the people at large have no ideas on the subject; the "builders" have been snubbed into taking a back seat and keeping it; and in architecture, as in all our fine arts, notably in the art of painting, the field has fallen into the possession of a set of clever, accomplished, but overcultivated young men who have come back from French and English studios, offices, and pedestrian trips, with a plenty of "material" in their sketch-books, much of it good in its own time and place, but, when worked up into houses for the average American, as alien to his mode of life, to his needs, and to his character, as can be conceived. Much fun has been made—and certainly too much fun could not be made—of the fact that the doors of Mr. Wm. H. Vanderbilt's house on Fifth Avenue are reduced copies of the gates made by Ghiberti for the Baptistery of Florence. The original gates, owing to the rooted defect of their design, to their multiplication of planes and of small parts, do not submit happily to reduction; and these Vanderbilt copies have a mean appearance, and are far from doing justice to the price that was paid for them. But, were they copies as perfect as could be made, the absurdity of their being where they are at all, would be no less; yet to this absurdity the architect of the house willingly lent himself, and art-writers, supposed to have reflected on the laws that govern art, have given their warm approval, in print, to this most tasteless proceeding.

In fact, the art of architecture has not received many worse blows in this country than have been given her by the three Vanderbilt houses recently erected in Fifth Avenue—two of them by architects of high reputation. Three such opportunities will not, it is likely, occur again for many years, and they have found our architects entirely unprepared for them. Mr. William H. Vanderbilt's house is the worst of the three, and though there is a story afloat that it is carried out in its present material contrary to the earnest wish of the architect, who had intended a light-coloured stone to be used, it is not easy to see how that could have made it look less like a gigantic knee-hole table than it does at present. What an incongruity between the coarsely-executed, ill-designed band of foliage that belts the entire building—one slab the exact repetition of another, and all having the appearance of being stamped with a waffle-iron! What an incongruity between this machine-work and the borders of the famous gates of Ghiberti, with their charmingly varied designs of leaf, and fruit, and flower, and bird! Where is the profit, I must ask, in being a millionaire if all one's money cannot command better design than this? And how discreditable to the profession of architecture in this country is the fact that a man with Mr. Vanderbilt's enormous fortune, and willingness to spend it, can find no better service than has been at his disposal in building this clumsy block!

It may be said that Mr. Herter is not an architect, properly speaking, but a cabinet-maker. Nevertheless, he is, I believe, a regularly-trained architect, and he is certainly a man of varied accomplishments. But, whatever may be thought of Mr. Herter, no one will deny that Mr. Richard Hunt is an architect; and, as an architect, he has certainly loaded earth with some of the most ungainly among all the ungainly structures that make our streets such a misery for any one who cares for good building. He spoiled quiet Beacon Street in Boston, enjoying her dowager respectable slumber in the shade of the Common elms, by the erection of the ugliest house that I believe has ever been built this side the Atlantic. He built the Lenox Library, with its silly pediments and blank monotony of wall—a very fit tomb, however, for the mummied treasures that are hermetically sealed within. Here again we see a very rich man powerless, with all his money, to get, artistically speaking, his money's worth. And now comes the Vanderbilt house, on which another fortune has been lavished, and what is the result? Nothing but a copy, and a slavish one, of the architecture of the time of Francis I., with its entrance an adaptation of a French Renaissance chimney-piece! There does not appear to be in all this pretentious, fussy building a single new motive; it has to the student the air of being nothing but a patch-work made up of bits whose original could easily be identified with a little search. Now, we laugh at the architect who, a few years since, was persuading us all to accept his designs for civil edifices and for private houses in the Norman style, the Perpendicular style, and the style of the Pantheon. But, on what grounds is it any more respectable to persuade a rich man to accept a design which is only a hash of French Renaissance detail, than to persuade a corporation into putting up a university building in the style of English Perpendicular Gothic, or another to erect a prison in a parody of Egyptian architecture? But all such doings make us regret the days when we had builders whose common-sense and correct eye could have saved us from being made ridiculous.

If I wished to make a complete survey of our blunders in architecture, I should need, not ten nor a hundred pages, but an entire number of this "Review," for they meet us at every turn. From the gigantic folly at Albany—a problem with which men of original talent like Messrs. Richardson and Eidlitz have struggled in vain, and lost far more than they have gained in the hopeless task of bringing order out of chaos—from this discreditable undertaking, to the various examples of Mr. Mullett's conceit and

ignorance, that make the Government a laughing-stock whenever it puts up a new post-office in any of our cities, or a new official building in Washington, there is really, to the most hopeful eye, very little outlook that is encouraging. Some relief had been hoped for with the advent of the group of young architects who were so cordially welcomed, and who have been rejoicing like little wanton boys that swim on bladders, these half-dozen summers, on a sea of glory. Of their cleverness there can be no doubt, nor that they have given many of our rich men prettier toys to play with than they could have been supplied with at any former shop. But, after all, we are beginning to find that the feast they invite us to is a feast of scraps, and that the strife seems to be with them, as with our women in the furnishing of their houses, who can invent the most startling novelty. After examining many of these fashionable houses, the impression is inevitable that what should be the true aim of the architect, the comfort of the occupants expressed with elegance, has been left entirely out of sight, and that the exhibition of the architect's ingenious fancy in the invention of "dodges," to be executed without the least regard to fitness or cost, has taken the place of the serious intellectual motives that ruled an older time. And the worst is that these offences are perpetrated in the name of a style that was remarkable for simplicity and propriety in its ornamentation, and for the comfortable dignity of its plans and general design. It seems impossible for these young architects to do anything quietly. They will not, if they can help it, let the eye rest for a moment anywhere. . . . The architects will, no doubt, have reason on their side if they throw a portion of the blame on the public. The public, they will say, insist on novelty, and encourage us, when we give them a little, to give them more. Great public buildings like the Produce Exchange are undertaken in a purely mercenary spirit, without a thought given to the intellectual credit of the corporation or to the elevation of the public taste. A carefully thought-out design, like that, for instance, sent in for our Produce Exchange by Mr. Withers, had no chance whatever—the drawings not even taken out of their portfolio, simply because the staircases were put in the only place fit for the staircases of such a large building, namely, at the angles. And a design that met with great favour was one in which the water-closets of the whole upper buildings were discharged through one of the iron columns that support the great main hall intended to accommodate the whole membership of the society!

### THE GRANBOROUGH CHRISMATORY.

THE last number of the Proceedings of the Society of Antiquaries contains the following description by the secretary, Mr. C. Knight Watson, of the Chrismatory which was lately discovered in the wall of Granborough Church, Bucks:—

This Chrismatory (which derives its name from one of the three oils it contained, the Sanctum Chrisma, the other two being the Oleum Infirorum and the Oleum Catechumenorum), may be described as a pewter box,  $6\frac{1}{4}$  inches in length,  $2\frac{1}{2}$  inches broad, and  $2\frac{1}{4}$  inches high, raised three-quarters of an inch from the ground by legs at the four corners, which appear to have been in the shape of four lions sitting. The remains of a hinge, with its pin at the back of the upper surface, points to the existence of a lid, of which, in fact, two fragments remain, in one of which is the small tube which adjusts itself readily to the pin of the hinge. The other and larger fragment has at the summit a pierced and engrailed ridge which (for reasons presently to be mentioned) seems to indicate that the lid was not flat but high-pitched. On lifting the lid we find three circular perforations,  $1\frac{1}{2}$  inch in diameter, made to receive three cylindrical pots with a flanged neck, nearly 2 inches deep, very much after the fashion of the ink-pot of a modern inkstand. Each pot has had its lid, of which two still remain, and each of the remaining lids has at one time had its button or knob, wherewith to raise or detach it. On so raising these two lids we find fastened to their under surface a metal prong  $1\frac{1}{4}$  inch in length; one of these still retains the hook at the end which was probably used to lift up the tow or cotton-wool from the bottom of the pot containing the oil, and so to moisten either the thumb of the priest or the persons of the sick, &c. Fragments of some fibrous material remain at the bottom of the pots. The presence of this material seems to be best explained by the words of the *Rituale Romanum*—"ut effusionis periculum caveatur, modum erit in his vasculis bombacium seu quid simile habere, Oleo sacro, et Chrismate separatim perfusum, in quo pollex, cum opus est, ad inungendum immittatur." The necessity of keeping the three oils in distinct compartments is insisted on by Archbishop Ælfric in his epistle entitled "Quando dividis Chrisma," printed in Thorpe's "Ancient Laws," &c., fol. p. 464, where we read—"Ye ought to have three flasks ready for the three oils, for we dare not put them together in one oil vessel, because each of them is hallowed apart for a particular service." In the Society's Proceedings for March 23, 1871 (vol. v., p. 117) attention was called to a representation of one of these tripartite Chrismatories in Strutt's "Heorda," vol. ii., pl. 57, where a box, very similar in its arrangements to the Granborough example, is seen in the hands of a server when the bishop is ministering extreme unction to

Richard Beauchamp, Earl of Warwick. Reference was also there made to an example of such a box which had been found at St. Martin's Church, Canterbury. This box is thus described in Dr. Dunkin's "Report of the Proceedings of the British Archaeological Association at Canterbury," 4to., 1844:—"An inkstand of the fourteenth century was found on the wallplate of the nave when the roof was removed." Having learned from Mr. Bloxom that this object when he saw it was in the possession of the Rev. W. J. Chesshyre, the then Incumbent of St. Martin's, I wrote to my friend, Canon Robertson of Canterbury, who informed me that it was now in the possession of Mrs. Chesshyre, and through the kindness of that lady this second example has been set up for exhibition, and is on the table to-night. It is a brass box 6 inches long, 3 inches broad, and 2 inches high. The lid is high-pitched with slanting gable ends, nearly equilateral, and surmounted by a vertical crest or ridge pierced with quatrefoils. The extreme height of the lid is  $2\frac{3}{8}$  inches. That of the vertical crest or ridge is  $\frac{7}{8}$  inch. The lid is attached behind by two hinges, each  $\frac{1}{2}$  inch broad, and of which the raised plates are riveted to the back and lid of the box. The lid is fastened, not locked, by a hasp, attached by a plate to the lid, and dropping on to a movable catch on the face of the box. The upper and lower edges of the box, and the ridge, are mounted with mouldings attached by rivets. On opening the lid the same arrangements are exposed to view as in the Granborough example; but they are in a still less perfect condition. The three oil-pots are all of them in fragments, and to none of them are the lids now remaining. At the bottom of the pots, however, we find similar traces of some fibrous material. The pots, unlike the box itself, are of pewter. In the "Handbook of English Ecclesiology," published by the Ecclesiological—late Camden—Society, 12mo., 1847, examples are given of Christmatories which are attached to and in fact are cut out of the same stone as the font. One of the most remarkable of these is at Youlgreave, in Derbyshire. Instances are also quoted of niches, in the immediate vicinity of the font, in walls or piers. I would submit that these niches may have been intended for the reception of metal boxes, such as those exhibited this evening. The subject is one of some interest, and it is hoped that the exhibition of these two examples may call the attention of those who have hitherto supposed they were the possessors of a mediæval inkstand.

### RESTORATION OF SEAFORD CHURCH.

A PUBLIC meeting was held in Seaford last week to consider the project for restoring the tower of the church. Plans were exhibited which had been prepared by Messrs. John S. Lee & Son, architects, and were accompanied by the following report to the vicar and churchwardens:—

Gentlemen,—Herewith we beg to hand you drawings and specifications of the proposed repairs and restorations, and we beg also to submit a few remarks to explain the principles which have guided us in dealing with this interesting church.

The ancient part of the fabric is very interesting, not only in its architectural, but in its archaeological and historical features. It has been our object to preserve intact as far as possible all the existing ancient features, and in all cases where it is necessary to make repairs for the purpose of arresting further decay. We have limited the repairs as far as is possible consistently with the preservation of the fabric, and in every case we have preserved one at least of the old members of the parts repaired to preserve the evidence of what the original was. In parts where the original has entirely disappeared we have referred to all the available evidence, books, and prints, and have endeavoured to reproduce what we believe to have been the original features.

The mediæval part of the church appears to have been built chiefly at three separate periods. The first, or most ancient, was built at the latter part of the eleventh century; it forms the exterior faces of the lower stages of the north and south sides of the tower, and consists of one arch on the north side, a similar arch on the south side. These archways are semicircular; the capitals are of the customary early Norman type, known as cushion caps. Above the archways, and of the same period, are small semicircular headed windows, which evidently formed the original clerestory windows; under these windows there still exists the original housing course of the first aisle roof, showing that there were aisles and not transepts north and south of the tower. We mention this fact as to there having been aisles and not transepts, as it appears to disprove a statement, which has been generally accepted, that this was originally a cross church.

The second part (in point of age) was built in the twelfth century, probably within seventy years of the first part. The first or eleventh century church, as originally designed, was perhaps never completed, or, if completed, it was soon destroyed. The second part was designed for a fabric upon a much larger scale. The parts of this (the thirteenth-century period) are two bays of the arcades, north and south of the nave, the windows of the clerestory of the nave, and in a line with them similar windows on the north and south sides of the tower (only a fragment of the one on the north side now remains). Under these latter windows there

remain some of the corbel-stones which supported the roof of the second aisle. Some of the corbels of the eaves of the nave roof are also of this period, and it is probable that the fragments of an arch, now to be seen over the western doorway, are remains of the doorway probably built at the same time.

The third part in order of antiquity was built probably in the latter part of the fifteenth century, and consists practically of the fabric of the tower, and was built inside of the walls of the nave of the original Norman church. The lower stages of the tower have, in fact, the outside walls of eleventh and twelfth century work, and the inside walls of fifteenth-century work; the upper stages are entirely of fifteenth-century work.

The window on the north side of the tower in the stage next above the vestry-roof is an insertion of a fifteenth-century window in the earlier clerestory window of the twelfth century. A few of the jamb stones of the earlier window are still to be seen outside of the jambs of the later insertion.

We have no difficulty in deciding upon what are the original features and design of the church tower, except in that portion of the lower part of the west side of it which has been faced with brick and flint in the present century. The modern brick and flint works are without any pretensions to architectural design; they have completely concealed, if they have not destroyed, the original mediæval work. The fifteenth-century doorway, however, still exists, and this, although it is meagre and of poor detail, we have retained on account of the light it throws upon the condition of the fabric in the fifteenth century. The original window over the western door has been removed, and a wooden window of the most wretched character has been substituted. We have no doubt that the modern wooden window is an unskilful copy of the original window, which was of stone, in three lights, of fifteenth-century work of the same character as the other fifteenth-century windows of the belfry stage. We have no conclusive evidence whether there were or were not buttresses on the west side of the tower, but we hope to find some evidence when the modern brick and flint come to be removed. We conjecture that in the rear of the modern brick and flint work will be found portions of the original Norman west end of the church, and that if any buttresses ever did exist they would be of the flat or slightly projecting type used by the builders of that period. We look to discover, during the execution of the works, what was the original design, and to make such modifications in our drawings as may be necessary to bring them to conformity with the original.

The ceiling of the first stage of the tower inside has probably been formed, or intended to be formed, by a stone vault. We are induced to form this opinion by the fact that the first course of stone of such a vault still remains both in the north and south sides. The present ceiling is a common modern wooden floor, and has joists fixed at a level below the points of the adjoining archways; this also tends to confirm our conjecture that the ceiling was a vault nearly concentric with and above the archway of the western window.

In accordance with your instructions we have made approximate estimates of the probable cost of the works in several sections as follows:—

Section No. 1.—The repair and restoration of the two upper stages of the tower, including the parapet and the roof, will cost about 200*l*.

Section No. 2.—The restoration of the western window will cost about 27*l*.

Section No. 3.—The restoration of western doorway, including a new oak door and new ironmongery, will cost about 37*l*.

Section No. 4.—The removal of the modern brick and flint facing of the lower stage of the tower on the western and southern sides, and the substitution of new stone and flint work to match the best of the old, will cost about 110*l*.

Section No. 5.—The repairs of the tiling of the roofs of the church generally, the substitution of new boarded ceilings to the church for the present lath and plaster ceilings, the provision of a new screen and swing doors in the inner face of the western doorway, the provision of a new vaulted ceiling to the first stage of the tower, the removal of the stove from the tower to the north aisle, the removal of the font from the tower to the western end of the south aisle, and the consequent alterations in the pews, will cost about 200*l*.

Section No. 6.—The provision of new steps in the western doorway, and of new boundary walls and gateways at the western side of the churchyard, will cost about 264*l*.

Section No. 7.—The formation of an open channel and dry area around the outside of the church generally will cost about 40*l*. Total, 878*l*.

We beg to suggest for your consideration whether the space of ground which will be available at the west end of the tower when the modern brick and flint works are removed should be thrown out into the public road. The road would certainly be improved; the appearance of the tower would also be improved, as no part of its elevation would then be hidden; and there would be a saving in expense, as a less length of boundary wall would have to be built.

A committee was formed to obtain subscriptions in order to carry out the work.

## NOTES AND COMMENTS.

At the last meeting of the Académie des Beaux-Arts those clauses of the will of the late M. LEHMANN that concern the Academy came up for consideration. In this rather eccentric document the late Chief Professor of the Ecole des Beaux-Arts enumerates various valuable works of art and furniture which are to be sold by public auction, and half the proceeds handed over to the Academy. If this moiety amounts to but does not exceed 25,000 fr., it is to be invested in State funds, and the dividends applied to the foundation of a triennial prize of 3,600 fr., "to be awarded to the young painter, aged at most twenty-five, who, during the three preceding years has executed the work which, in the choice of subject, composition, style, and execution, protests the most eloquently against that debasement of art which appears to be encouraged by the doctrines most in favour at the present day." Such are the exact terms of the will, and they contain a striking condemnation of the theories and tendency of the modern realistic school of painting, against which the testator throughout his lifetime waged ceaseless warfare. The official denomination of the prize is to be the "Prix Lehmann, for the Encouragement of good Classical Studies"; and according as the sum realised exceeds or falls short of 25,000 fr. the prize is to be made biennial, or the capital allowed to accumulate until the required sum of 25,000 fr. is realised. The Academy will to-day decide upon the acceptance or refusal of this curious legacy.

THE director of the Paris art publication *L'Art* has presented to the Louvre a portrait by ALLAN RAMSAY of Queen CHARLOTTE, the wife of GEORGE III. The Louvre does not possess many pictures by English artists, but there is now a desire to obtain them, and the portrait by the Scottish master will be a valuable acquisition. *L'Art* has also given to the Louvre six drawings by some unknown miniaturist of the French school.

THE invitation of the Glasgow Institute of Architects to competitors for the proposed Municipal Buildings ought to have been accepted more generally. As only forty-nine architects have responded, the designs which are on view in the Corporation Galleries do not represent one-half the labour which has been expended on the competition. It has been ascertained that eighteen of the Glasgow competitors have sent their designs, together with twelve from London, four from Edinburgh, and three from Manchester. The exhibition will remain open during the week.

THE geological character of the stones forming the Stonehenge group has been determined by Professor PRESTWICH, the geologist. In addressing a small party of members of the British Association he said that the stones consisted of two sorts—large blocks of sandstone, and smaller blocks of slates and rocks of igneous origin. It was formerly supposed that those great masses of sandstone had been brought from Bagshot Heath, where were found masses of stone of similar composition. But that was not the case. There would have been enormous difficulties in carrying stones such a distance. The plain consisted of chalk. The outer layers were of the lower tertiary beds. The country had been denuded of the softer masses of clay and sand, the larger masses being strewed over the surface. The extreme scarcity of stone in that district had led to the use of large sandstones for farm purposes. About one mile from Stonehenge were found still *in situ* blocks of stone similar in character. In the neighbourhood of Marlborough they were found in greater quantities. Now, he believed that when the Britons first inhabited that country the plains were scattered over here and there with blocks of sandstone, and thus there was no great distance to convey them to Stonehenge. With regard to the smaller blocks they must have come from a great distance—in the opinion of some persons, from the Welsh mountains. But Professor PRESTWICH was of opinion they represented some of the rocks of Brittany. It was not impossible that the same tribes which erected the great monuments and other monuments of Brittany might have come to this country and brought with them the smaller blocks which formed the inner circle, and left the larger ones to be supplied from the native rocks. The Professor declined to say anything about the use of Stonehenge.

HALLAM expresses surprise at the extent of the knowledge attributed to DA VINCI, and which would seem to be in advance of his generation. But the evidence of the artist's skill in the sciences hitherto had to be taken on trust. With the exception of the "Treatise on Painting," and of which a sort of translation into English exists, few of his manuscripts have been printed. They are found in public and private libraries, and if they had been written by Egyptians less could hardly be known of their contents. But this obscurity is not likely to endure for long. An attempt has been made in France to employ one of the photographic processes to reproduce some of the manuscripts belonging to the Institute, and the success is so great as to excite other Governments to follow the example of the French. DA VINCI wrote from right to left on his pages, but in order to facilitate enquiry the matter has been printed in the ordinary way at the foot of each page, and a translation is given.

Two documents possessing great artistic interest, inasmuch as they give the prices paid for the works of the great Dutch masters during their lifetime, or shortly after their decease, have lately been found in Holland. One is the official catalogue of a lottery organised in the year 1649 by JAN DE BANDT, of the Hague. The list enumerates as prizes various works of art, among them being several paintings which in our day rank as masterpieces. Opposite each work is placed an estimate of its value, as fixed by a committee of artists specially designated for the purpose, and the following may be taken as a sample of their opinion:—*The Alchemist*, by TENIERS, 25 florins; *Peasants*, by the same, 25 florins; a large battle-piece, by CUYP, 52 florins; five other works of same artist, 45 to 52 florins each; and two works by JAN VAN GOYENS, 10 and 25 florins respectively. The other document, which was found at Rotterdam, is entitled "A List and Inventory of Pictures, with the prices I paid for them," but the name of the author is unknown. Various items of this catalogue are worthy of quotation:—A seascape, by VAN DER VELDEN, 400 florins; a battle-piece, by PHILIPPE WOUVERMANS, 44 florins; the *Femme au Verre*, by GABRIEL METZU, 8 inches high by  $7\frac{1}{2}$  inches in width, 106 florins; peasant scene, a masterpiece of VAN OSTADE, 70 florins; and the interior of a peasant's cottage, by TENIERS, 70 florins. From this it will be seen that TENIERS' works were more esteemed, the price of a good painting by him having risen from 25 florins, given in 1649 for *The Alchemist*, to 70 florins, paid about the year 1750 for the peasant interior.

THE members of the Royal Commission on Technical Instruction have not been idle during the past month. Considerable progress has been made in the collection and arrangement of the vast amount of information collected by the Commissioners during their visit to France, Germany, Austria, Switzerland, and Italy. They have recently been engaged in pursuing their investigations here and abroad. Professor ROSCOE and Mr. SWIRE SMITH are occupied in reporting on the industries and schools in the neighbourhood of Kendal and Barrow. Mr. WOODALL, M.P., and Mr. REDGRAVE are at present travelling in the Black Forest, where they are collecting information with respect to the native home industries of the district, principally with the view of ascertaining if similar industries, under necessarily altered circumstances, might advantageously be introduced into any parts of the United Kingdom. Mr. B. SAMUELSON, M.P., and Mr. PHILIP MAGNUS have been spending some little time in Ireland, where they have been instituting inquiries into the possibility of improving the material condition of the labouring classes by the establishment of trade schools and the introduction of new means of livelihood among the agriculturists of the poorer districts of the country.

At a late meeting of the French Antiquarian Society, M. MUNTZ read a paper on "The Tomb of Pope BENOÎT XII. at Avignon." Some accounts of expenses found by M. MUNTZ in the archives of the Vatican, and dated 1342 and 1343, prove that the tomb is the work of a Paris carver or sculptor—JEAN LAVENIER by name—hitherto totally unknown. While the painters employed by the Avignon Popes—residing, be it remembered, on French soil—were almost invariably Italians, it is noteworthy that their architects and sculptors were generally French. In this fact M. MUNTZ sees a fresh proof of the superiority of France in art.

AGRICULTURE, DECORATIVE FRIEZE: HORTICULTURE.

THE illustration published this week completes the series painted by M. JULES DIDIER, and we are glad to be able to announce that the work has been fully appreciated by the English public.

## JAPANESE GOLD LACQUER-WORK.

A REPORT has been prepared by Mr. J. J. Quin, Acting Consul at Hakodate, on the lacquer industry of Japan. It is intended chiefly as a description to accompany a collection of illustrative specimens, tools, and products at the Economic Museum at Kew. The cultivation of the lacquer-tree and the manufacture of the various kinds of lacquer is described, the woods used for the production of lacquer ware, and the various processes of lacquering, from the ordinary plain work to the treatment of gold lacquer. In drawing up the report it was found that a number of Japanese terms had to be employed which necessitated a somewhat detailed explanation, so as to be intelligible to any one not acquainted with the language and not familiar with the technicalities of the trade. The following extracts on the gold lacquer work, describing the mode of treatment, may be of interest:—

*Mode of making Gold Lacquer.*—A description is given first of *Togi-dashi* (bringing out by polishing). The article, having been already subjected to twenty-two processes of ordinary lacquering, is then treated as follows:—The picture to be transferred to the article is drawn on thin paper, to which a coating of size made of glue and alum has been applied—that known as *Mino-gami* is best. The reverse is rubbed smooth with a polished shell or pebble, and the outline very lightly traced in lacquer, previously roasted over live charcoal to prevent its drying, with a fine brush made of rats' hair. The paper is then laid, with the lacquer side downwards, on the article to be decorated, and is gently rubbed with a whalebone spatula wherever there is any tracing, and on removing the paper the impress may very faintly be perceived. To bring it out plainly it is rubbed over very lightly with a piece of cotton wool, charged with powdered white whetstone or tin, which adheres to the lacquer. Japanese paper being peculiarly tough, upwards of twenty impressions can be taken off from one tracing, and when that is no longer possible, from the lacquer having become used up, it only requires a fresh tracing over the same paper to reproduce the design *ad infinitum*. This tracing does not dry, owing to the lacquer used for the purpose having been partially roasted, as previously mentioned, and can be wiped off at any time.

The next process is to trace out the veining of the leaves, or such lines to which in the finished picture it is desired to give the most prominence, and these lines are powdered over with gold dust through a quill. The qualities called *Mijin*, *Koma-kame-mijin*, and *Aragoku*, are generally used; either finer or coarser qualities cannot be used. The article is then set to dry for twenty-four hours in the damp press. The outline is now drawn carefully with a rat's hair brush over the original tracing line with a mixture of black and branch lacquer, called *Rō-sé*. The whole is then filled in with *Rō-sé* applied with a hare's hair grounding brush. Gold dust of a slightly coarser quality than *Mijin* is scattered over the lacquered portion, and the article is set to dry for twenty-four hours. Another thin coating of *Rō-sé* lacquer is again given to the gold-powdered portions, and the article set to dry for twelve hours. Next, a coat of *Rō* (black lacquer) is applied over the whole surface of the article, which is set to dry for at least three days. It is then roughly ground down with *Magnolia* charcoal, the surface dust being constantly wiped off with a damp cloth till the pattern begins to appear faintly. Another coating of *Rō* lacquer is then given, and the article set to dry for thirty-six hours. It is again ground down with *Magnolia* charcoal as before, this time till the pattern comes well out. The ensuing processes are the same as described in black lacquer.

In making *Togi-dashi* on hard woods, transparent lacquer is used instead of *Rō*.

*Flat Gold Lacquer.*—For this method, called *Hira-makiye*, the article having been thoroughly finished, either in black or red, &c., a tracing is applied to the surface as in *Togi-dashi*, the outline is carefully painted over with a fine brush of rat's hair and then filled in with a hare's hair brush, using *Shitamaki* lacquer (branch lacquer and red oxide of iron). Over this surface, gold dust, of the quality called *Aragoku*, being generally used, is scattered with a brush of horse's hair (*Kebo*) till the lacquer will not absorb any more. The article is then set to dry for twenty-four hours. A thin coating is next applied over the gold, of transparent lacquer, or *Yoshino* lacquer, and set to dry for twenty-four hours at least. It is then most carefully smoothed with camellia charcoal, and finally polished off with *Tono-ko* and a little oil on the point of the finger, till the ornamented portion attains a fine polish. The veining of leaves and the painting of stamens, &c., of flowers, or such other fine work, is now done with a fine rat's hair brush charged

with *Ke-uchi* lacquer, over which fine gold dust (*Goku-mijin*) is scattered from a brush of horse's hair (*Kebo*) as before, and the article set to dry for twelve hours. Some *Yoshino* lacquer is then applied to a piece of cotton wool, and rubbed over the whole surface of the box or other article, and wiped off again with soft paper. It is set to dry for twelve hours, after which it is polished off with deer's horn ashes and a trifle of oil. When very high-class work is desired, *Yoshino* lacquer, to which a little water has been added, is applied, and polished off a second time, and a very brilliant surface is attained.

More ordinary "flat gold lacquer" differs in the manufacture as follows:—The tracing is accomplished in the same manner, but *Shitamaki-nobe* lacquer (branch lacquer, red oxide of iron, and camphor) is used for filling in the pattern with a hare's hair brush. The article is then set to dry in the press for ten to twenty minutes, during which time the lacquer has begun to harden, and less gold will adhere. Then gold dust (*Goku-mijin*) is applied with cotton wool thinly, and the article is set to dry for twenty-four hours. The whole surface is then smeared over with *Yoshino-nobe* lacquer (*Yoshino* lacquer and camphor) on a piece of cotton wool, and wiped off again with soft paper. The reason is that it is less trouble to smear over the whole surface thinly, and it is, moreover, not necessary to give a thick coat of lacquer to the decorated part, as the gold dust has been very thinly applied. It is set to dry for twelve hours, and ground smooth with camellia charcoal, and polished with powdered whetstone and oil on the point of the finger. The fine lines are then drawn with a rat's hair brush charged with *Shitamaki* lacquer, and sprinkled with gold dust (*Goku-mijin*) from a brush (*Keto*), and the article set to dry for twelve hours. The whole is again smeared with *Yoshino-nobe* lacquer, and carefully wiped off again with paper, and set to dry for twelve hours. The article is then polished with powdered whetstone and oil on the point of the finger, and a second application of *Yoshino-nobe* lacquer with a little water, wiped off with soft paper, set to dry for twelve hours, and finally polished off with deer's horn ashes and oil on the finger, finishes the operation.

Should it be required to make any dark spots or lines, such as birds' eyes, or to draw human hair, &c., or other shading, this is done last of all with *Kuma*, "bear" lacquer, and *Jō-hana*, and lamp-black.

For a more common kind of flat gold lacquer painting, instead of tracing the design in roasted lacquer, it is done with a mixture of powdered *Tono-ko* (burnt clay from Mount Mari) and water, and the impression is transferred to the articles with the whalebone spatula as before. The reason for only using *Tono-ko* instead of lacquer is that the groundwork being inferior it cannot be ground or smoothed afterwards, and the edges of the pattern would not be clean, nor stand out clear, should any lacquer get smeared outside the tracing line. The outline is then filled in with *Shitamaki-nobe* lacquer with a coarse hare's hair brush, and the article is set to dry for twenty minutes, or till a thin skin has formed on the lacquer, and then the half-dry surface is wiped over with cotton wool charged with *Keshi-fun*, the finest gold powder, and set to dry for five or six hours. The whole surface is then smeared with *Yoshino-nobe* lacquer, which is carefully wiped off again with soft paper, and the article set to dry for half a day. The surface is then rubbed over gently with deer's horn ashes and soft paper to give it a polish, and to get rid of any of the last coat of *Yoshino-nobe* lacquer.

The fine lines are now drawn with a fine hare's hair brush charged with *Shitamaki-nobe* lacquer, and the article set to dry for twenty minutes or so; then *Keshi-fun* is applied with cotton wool, and again set to dry for five or six hours. No further process takes place.

*Raised Gold Lacquer.*—In the method *Taka-makiye* the ground-work may be either black or coloured lacquer, *Nashiji* (pear basis of gold dust), or the plain wood. The outlines of the pattern are transferred to the surface of the article in the same manner as in *Togi-dashi*, or "flat lacquer." The outline is then painted over with *Shitamaki* lacquer, and this is covered with powdered camellia charcoal. If the outside is to be higher than the inside, a broad margin is painted and covered with the charcoal powder, leaving the centre untouched, and *vice versa*; if the centre is to be higher a faint line only is painted outside, and the inside is given a thickish coating, which is sprinkled with the charcoal dust, and the article set to dry for twelve hours. When taken out of the press it is well dusted to get rid of any loose charcoal powder, and is also washed, using a brush made of human hair (*Hake*) to clean out all crevices and bring out the lines, &c. Some *Yoshino-nobe*, or "branch lacquer," with camphor, is now rubbed on with a piece of cotton wool and carefully wiped off with soft paper, and the article set to dry for twelve hours. The raised parts are next carefully ground smooth with a piece of *Magnolia* charcoal, and a second coat of *Yoshino-nobe*, or of "branch lacquer," is applied as before and dried.

[If a well-raised pattern is required, one, two, or even three coats of *Sabi* ("branch lacquer" and *Tono-ko*) are applied, the outside edges being painted with a brush of deer's hair (*Menso*), and the inside lacquer applied with a small *Sabi* spatula, the article being set to dry between each application for twelve hours. For coarser work it is then ground smooth with a white whetstone, and

for finer work with a yellow whetstone. Over this some "branch lacquer," mixed with camphor, is rubbed with cotton wool and wiped off with soft paper, and the article set to dry for twelve hours.]

If the pattern is not to be very high the operations described between the brackets are omitted. A coating of *Takamaki* lacquer is now given, the outside hedges being carefully drawn with a rat's hair brush, and the inside of the pattern filled in with a hare's hair brush, and the article set to dry for thirty-six to forty-eight hours. When taken out of the press the surface is ground smooth with *Magnolia* charcoal, and then partly polished with powdered camellia charcoal on a cotton cloth. A little oil is now rubbed on, and a further polishing takes place with powdered "whetstone" on a cloth. Next "branch lacquer" is rubbed over the raised parts with cotton wool and wiped off with soft paper, and the article set to dry for twelve hours. It is next polished with deers' horn ashes and a little "rape seed," or "sesamum" oil applied on the point of the finger. Up to this point the formation of the pattern, whether mountains, waves, trees, men, birds, or animals, has been gradually completed.

If small squares of gold foil (known as *Kiri kane*), or of coloured shell, are used in producing the pattern, they are now applied one by one on the point of a bamboo stick (*Hirame fude*), the spot where they are to be affixed having been smeared with a little *Rō-sé* lacquer to make them adhere. When all that is required has been affixed, a piece of soft bibulous paper is spread over the freshly-done parts and pressed very carefully with the finger. This is to get rid of as much of the *Rō-sé* lacquer as is not covered by the gold squares as possible; the article is set to dry for twelve hours, and then the portion where the gold has been applied is gently polished with a little camellia charcoal on the point of the finger, to get rid of the remainder of the *Rō-sé* lacquer. Shell patterns, and the coarser kinds of gold dust that may be required, are applied in the same manner. The finer kinds of gold dust are applied next, over a coat of *Shitamaki* lacquer, and the article set to dry for twelve hours. The remaining processes of polishing, drying, &c., are the same as in first-class "flat gold" acquer.

For making raised lacquer patterns on plain wood the whole surface is covered with tinfoil, stuck on with rice paste, to keep the wood quite clean, and then the place only where the pattern is to come is cut out. In making all high-class lacquer the edges of every article are pasted over with tinfoil to prevent their being rubbed or injured by the workman, and the same is done over each portion as it is finished.

The above is the ordinary method of making best raised lacquer, but there are such innumerable modifications of one process or another, according to the object to be produced, that it is manifestly impossible to do more than give the above cursory sketch. Nearly every piece of good lacquer made exhibits a specimen of each kind, viz., *Nashiji*, *Togi-dashi*, *Hira-makiye*, or *Takamakiye*.

In making raised lacquer on inferior articles the methods do not vary much from the good kinds; the work is merely less carefully executed. The saving is in the quantity and quality of the gold dust used, and the absence of minute after-work, or in the use of silver and tin instead of gold dust. In the very cheapest kinds burnt tin dust is used instead of charcoal over the first coat of *Shitamaki*. This is burnished bright, and over it a thin coating of lacquer and gold dust is applied. At first it looks well, but loses its colour in a year or two. By using tin powder the same height is attained in one coat that would necessitate at least three coats of lacquer and charcoal dust. This kind of work is, however, only used for cheap articles for foreign export, and has been quite lately introduced.

**Lacquering on Metal.**—For lacquering on iron or copper, brass or silver, the metal is smoothed and polished, and then given a coating of "crude lacquer," or "black lacquer"; the article is put over a charcoal fire, and the lacquer is burnt on to the metal till all the smoke ceases to escape. The fire must not be too fierce, and the metal must not be allowed to get red-hot, or the lacquer turns to ashes. After the lacquer has burnt quite hard the surface is rubbed smooth with *Largerstramia* charcoal; these operations are repeated three or four times, till a good foundation of lacquer has been obtained. Then the same operations exactly are repeated as in making best "black lacquer." *Togi-dashi*, "flat gold lacquer," or "raised gold lacquer," only that the lacquer is burnt dry over the fire instead of being dried in the press. The lacquer is thus rendered quite hard and very durable. After the first two or three coats have been burnt on, the subsequent drying processes can be carried on in the damp press, should it be so desired.

In winter, or when any article is required in a hurry, the workmen sometimes put a charcoal fire in the press, over which a pan of hot water is placed. The steam which is thus generated helps to dry the lacquer in an hour or two, which would take twenty-four hours to harden ordinarily, but the lacquer thus dealt with loses its strength, and is never very hard. "Black lacquer" turns a rusty brown, the colouring virtue of the iron being apparently lost, and therefore this plan is never adopted for good work, and in second-rate work only for under coats.

The style of ornamentation, *Nashiji*, occupying an intermediate position between plain and ornamental lacquer, is therefore treated of last. Till the opening of Japan to foreign trade it was in the hands of workers in gold lacquer, but now for the most part all *Nashiji* on articles intended for exportation is applied by the workers in plain lacquer. In making best *Nashiji* as in *Togi-dashi*, the first twenty-two processes are identical. A coating of *Rō-sé* is applied, and the gold dust is sprinkled over this surface through one or other of the bamboo tubes, according to the fineness required. The article is set to dry in the press for forty-eight hours, and is then given a coating of pure transparent varnish. This is set to dry for three or four days, when it is roughly ground with *Magnolia* charcoal, and a second coat of transparent lacquer given. The article is set to dry for forty-eight hours, and then ground with *Magnolia* charcoal till a perfectly smooth surface is obtained. Transparent lacquer is then applied with a piece of cotton wool, and wiped off again with soft paper, and the article set to dry for twenty-four hours. It is then polished with a mixture of *Tono-ko* and camellia charcoal powder and a little oil. Next, a coating of *Yoshino* lacquer is given, and wiped off with paper; the article is set to dry for twelve hours, and then it is polished with deer's-horn ashes and oil. This is repeated three times to finish the article.

The same processes are gone through when using silver instead of gold dust. For cheap qualities tin dust is used, and the powder is scattered on glue immediately above a coating of *Kanoji* (whiting and glue). When the article is dry it is burnished with *Tokusa* (*Equisetum*), and as soon as it presents a bright surface a coating of pure transparent lacquer, with gamboge, is given to it. It is set to dry for a day in the press, and then ground with *Magnolia* charcoal. Over this a coating of *Shu-urushi* (transparent varnish containing oil) is applied, and another drying for twenty-four hours completes the process.

## MANCHESTER CATHEDRAL.

THE following memorandum in explanation of the proposed restoration has been forwarded to the committee of the Society for the Protection of Ancient Buildings by the Cathedral authorities:—

The parish of Manchester was anciently a rectory. It was taxed by Pope Nicholas IV. in the year 1291. In 1307 the barony of Manchester, together with the advowson of the rectory of Manchester, became the property of the Lords de la Warre, and in 1421 one of this family got the church converted from a parish to a collegiate one, and the foundationers were styled "The Guild or Company of the Blessed Virgin in Manchester." The collegiate buildings are a short distance from the church, and still remain the most interesting and perfect ancient buildings in Manchester. These are in active use as schools and domiciles for one hundred poor boys under Humphrey Chetham's bequest, and for the housing of a fine old library founded and supported by money from the same generous benefactor. The chancel of the church was constructed by John Huntingdon prior to 1458, in which year he died. At the dissolution the collegiate became a rectory, and again, after the marriage of Philip and Mary, it was re-established, while Queen Elizabeth, on the humble petition of the people of Manchester, granted a renewed charter of foundation, and the church was re-dedicated and became from that time to this Christ's Church. In 1617 a gallery was added to the church, chiefly at the cost of Mr. Humphrey Booth. In the present century the work of restoration began. Briefly the cathedral may be described as follows:—The original plan consisted of nave and choir of equal length, with side aisles and a western tower. There were no transepts. After the church was thus completed, chapels were founded and added so as to form double aisles to the nave and choir, excepting a small portion at the south side, and at the east end a lady chapel was erected. It is built of brown sandstone from Collyhurst, about a mile from the cathedral. The style of architecture is Perpendicular; but not being intended for a cathedral, it is not one of the finest examples of that style, but looks like what it was built for, a fine parish church. The woodwork in the main church is not remarkable, but is interesting, which cannot be said of its stained glass. The woodwork in the choir, however, is of a very high order. The second aisle in the north side of the choir is filled by the Derby chapel, and it is as long as the choir itself. This chapel has been rebuilt in accordance with the original design at the expense of the Derby family. The lady chapel was built about 1520. It is square, with late Perpendicular windows. It has been carefully preserved, and recently slightly restored. Most of the exterior of the cathedral is modern, the western tower entirely so, having been built by the Chapter architect, Mr. James P. Holden, about twenty years ago. Mr. G. G. Scott, R.A., thought at the time that it might have been restored, but it was thought better to rebuild it. The present tower is not a copy of its predecessor. It is a fine structure, and is 137 feet high. The restoration now proceeding has been undertaken by the churchwardens, at the instance of the present architect of the Chapter, Mr. J. S. Crowther, of Alderley, who is as much interested in retaining the

old form and quality of the building as the safety of the structure will permit. It appears that the pillars and arches of the nave, including the clerestory, were in the early part of the present century deeply chipped and covered with plaster. This plaster has been recently removed in order to ascertain the condition of the building. It was then found that in several ways the structure was not safe, and that the mutilation at the time of plastering, and which included the knocking away of all capitals, was so great that the building was neither safe nor presentable. To get rid of these chipped and plastered surfaces it was decided to rebuild the pillars, arches, and clerestory in the nave, stone by stone and line by line, upon the old work, all details being based on those of the old building. The old pillars had been laid without any structural foundation and were not safe; indeed, there is just a suspicion of "jerry" about the job. There are four pillars rebuilt already, and the stone used is a red sandstone similar to that of the original building. These are all the alterations or restorations decided upon at present, but in time the work will probably extend much further. The Dean, Canons, and Churchwardens are the responsible people for the alteration, and they have every confidence that their architect, Mr. Crowther, will do all he can to preserve the ancient beauties of this fine old church.

### IMPROVEMENTS IN GAS LIGHTING.

A PAPER was read by Mr. William Sugg at one of the meetings of the Mechanical Section of the British Association on improvements in gas illumination. He pointed out that the great hindrance to improvements was the public, who supplied themselves with the cheapest burners and stoves and then blamed the quality of the gas. After describing certain improvements in burners, he said the progress of invention in gas lighting was great and continuous, and in the future, if the public would only interest themselves just sufficiently to obtain a moderate amount of information on the subject of gas, they would be enabled to use it with great economy and comfort to themselves. The facile manner in which gas could be employed to produce the light of a rushlight or the blaze of a thousand candles by the mere turn of the wrist, joined to the readiness with which it could be conveyed to great distances without any practical loss, would always ensure for it a large and growing demand everywhere.

### SCOTTISH SOCIETY OF WATER-COLOUR PAINTERS.

THE members and associates of the Scottish Society of Water-Colour Painters met together at the annual luncheon in the Fine Art Institute, Glasgow, on the 1st inst. Mr. F. Powell presided. The chairman first proposed the toast of "The Queen," and next "The Royal Scottish Academy." The Academy, he said, had done so much for art in Scotland, that it was almost impossible to estimate its beneficial influence. The success of the Royal Scottish Academy was now firmly established. The institution could boast of a great many celebrated artists who had belonged to it, and there were still many celebrated men connected with it, so that all Scotchmen had reason to be proud of their Academy.

Mr. Hugh Cameron, R.S.A., replied.

Mr. W. E. Lockhart, R.S.A., proposed "The Glasgow Institute of the Fine Arts." The Institute had now come to occupy a very important position in this country. Under the present régime it had earned for itself the thorough respect not only of the citizens of Glasgow, but of all artists and all Scotchmen. As a Scotchman and as a member of the Academy in the east, he wished the Institute every success.

Mr. James Muir, C.A., replied. The Institute of the Fine Arts was one of those societies which rendered possible such an institution as that in connection with which they were met that evening. It would be remarkable if artists did not recognise the disinterested friendliness with which gentlemen, who had cares of a very much more serious nature, devoted a large portion of their time in furthering the cause of art.

Mr. D. E. Outram proposed the "Scottish Society of Water-Colour Painters." He earnestly desired to see the city keeping pace in the cultivation of the fine arts with its commercial prosperity. It had scarcely done that yet, but it was making very great strides. In the matter of music the city had taken a position which really put it in the first rank, and such societies as that in connection with which they were met would put it in the first rank as regarded paintings and painters. Long might the Scottish Society of Water-Colour Painters continue to extend its influence throughout the country. The society had been very much indebted to many of its members for their exertions in its behalf, and he would mention specially Mr. Walker, of the Institute, Mr. Smith, the secretary, and above all, their chairman, the president of the society.

The Chairman responded. He said that water-colour painting had been making great advances. A few years ago water-colours were very little known and very little practised, but on looking at the paintings around them they would agree that very great strides

had been made. There had always been a fear that water-colours were not permanent, but this had been proved to be a mistake. The oldest picture exhibited at the Royal Academy in London last year was a water-colour, *The Adoration of the Shepherds*, painted in 1450, and it showed very few signs of decay. The Chairman afterwards proposed the toast of "The Guests."

Sir Peter Coats, in responding, said that he had always been a great admirer of the fine arts, and he had contributed his little aid and countenance to their encouragement and advancement.

Among the other toasts were—"The Chairman," proposed by Mr. James Sellars; and "The Croupier," proposed by Mr. Robert Greenlees.

### TESTING OF IRON.

IN 1872 the attention of the United States Government was drawn to the necessity of providing an accurate testing-machine, in order to ascertain the strength of the iron and steel used in buildings, bridges, and other structures. After some delay a machine was completed, which for accuracy of the results obtained and range of power exerted is unequalled, perhaps, in the world. Owing to the length of time expended in completing it, however, the original appropriation became exhausted, and the Board was legislated out of existence, having had scarcely an opportunity to verify the capabilities of the very instrument which had been brought to perfection under its fostering care, and through the proper use of which so much valuable information could be obtained. Although the Board had ceased to exist, the machine remained the property of the United States. It is located in the Watertown Arsenal, near Boston, under the immediate charge of the Ordnance Department of the army, and is nominally at the service of engineers and others who may be able to defray the necessarily heavy expense of working it for their own private benefit. But as there are no assistants permanently engaged to form a staff, the cost of tests is excessive. Over seven days were required to test nine steel eye-bars, and the cost was fifteen dollars per bar.

The American engineers are again calling the attention of the Government to the subject, as an immense quantity of iron is employed yearly throughout the States. In the department of bridges there were required for last year's construction not less than 80,000 tons of iron and steel, representing, say, 50 miles of bridges, over which the safety of life and limb is supposed to be assured by the accuracy of the calculations of the designer, no less than the quality of the material employed. Of this material upwards of 35 per cent. is in the form of compound sections specially adapted to resist compressive strains; and yet until quite recently all the experimental data upon which such sections are designed were obtained through the instrumentality of testing-machines which, particularly at high pressure, are liable to give very erroneous results. Of rolled beams there were produced last year upwards of 50,000 tons. This form of product is used chiefly in floors of buildings, often to sustain great weight, as in warehouses, and somewhat also as stringers in bridges. Their strength is estimated by theoretical formulas, in which the physical constants are taken from experiments upon foreign irons tested under circumstances entirely different from what are obtained in actual practice. Fortunately for the cause of safety in the use of such materials, it is probable that the formulas in question do not represent the full strength, and that a considerable amount of unnecessary weight is loaded upon our structures in consequence; but there is all the more reason why the actual strength should be determined by experiment, in order that an uniform factor of safety may apply to every member of a structure, or, in other words, that it shall be equally strong in all its parts.

At a late meeting, General Meigs, in supporting an appeal to Congress, said the Government itself is the largest single user of these materials; the railroads altogether use more, but there is no single organisation which uses so much. Congress appropriates the money with which are erected the large Government structures that are found now in almost every city. It is stated in the public press that it is in contemplation to erect a hundred new Government buildings in a hundred cities this year. In all these buildings the floors are supported upon rolled iron beams, and the principal materials used for roofs are iron. These buildings are all dependent for their cost upon the size of their dominant members, and, as a consequence, upon the factor of safety which the architect allows; so that as long as there is uncertainty as to the proper coefficient of safety, perhaps from two to five times as much metal as is actually necessary may be put into these members. There are other materials used in buildings—brick, stone, marble, timber—but these materials we buy by the cubic yard or cubic foot; they are comparatively inexpensive. Metal we buy by the pound, and at this time we pay pretty high prices for the pound; so that if we can reduce our general coefficient of safety, we save perhaps one-half to two-thirds of the actual cost of the material used. Congress sits under a roof of iron; its building is crowned by an iron dome. It is about building a new Navy, and is considering whether it shall be of steel or of iron, and the result will depend upon the comparative qualities of steel and iron.

M. O. Chanute in describing his own practice said that while no man knows exactly what weight will crush flat, say a 4-inch cube of wrought iron, we do know that it begins to yield, without recovering its shape, at pressures of some 36,000 to 40,000 pounds to the square inch. Accordingly, with the aid of the formulas in common use we proportion compression members for an assumed crippling point, varying from say 35,000 pounds to the square inch, for pieces of ten diameters in length, down to about 24,000 pounds to the square inch for pieces forty diameters in length, and upon these we allow strains varying from 7,000 to 4,800 pounds to the square inch, as working compressive loads; while in tension we allow some 10,000 pounds to the inch on iron, with a breaking strength of 46,000 to 50,000 pounds, and an elastic limit of 26,000 pounds per square inch. Now, in my judgment, the crippling point of a compression piece corresponds more nearly with the elastic limit in tension, than with the ultimate or breaking strength. The probabilities of any compression bridge member being strained up to the crippling point, are nearly as remote as the probabilities of a tension member being strained up to its elastic limit, and to have all parts equally strong, should experiments justify this view, we should base our assumed margin of strength (you will note that I do not use the term "factor of safety," as I think it misleading) upon the *crippling* strength and the *elastic limit* of the material. As for myself, I believe that we are now making our compression members considerably stronger than the tension members; that if we were to break down a bridge by fair loading, granting of course that all the *connections* should be made stronger than the body of the pieces they attach together, rupture would probably first take place in one of the tension members. But then while so believing, I do not *know*. I confess my ignorance upon this point, and until this ignorance is removed I shall go on specifying for proportioning bridges in the old way, and with the old formulas. Not only is there great uncertainty concerning the actual strength of compression members, but we do not know accurately the strength in tension of full-sized bars worked to various dimensions and with a different amount of pulling and squeezing in the rolls.

## SCULPTURE FOR THE ST. GEORGE'S HALL LIVERPOOL.

A MEETING of the Liverpool City Council was held on Wednesday, when the recommendation of the Finance and Estate Committee to award the premiums for designs for sculptured panels at St. George's Hall to Mr. T. S. Lee (200*l.*), Mr. J. Milo Griffith (100*l.*), and Mr. W. S. Frith (50*l.*) was agreed to. The same committee also recommended that, subject to satisfactory terms being agreed upon, and the approval of the remaining designs as suggested by the artist, Mr. Thomas Sterling Lee be entrusted with the execution of the work.

Sir James Picton, in moving its adoption, stated that Mr. Lee was a student of the Royal Academy, where he took a very distinguished place, obtaining the gold medal against all England. He also obtained a still more striking prize in the shape of a travelling scholarship, enabling him to travel for three years through the principal centres of art on the Continent of Europe. He spent a considerable time in Greece studying ancient subjects, after which he went to Paris as a student there, and took a silver medal in competition with the whole of the students in Paris. He (Sir James) thought it would be scarcely possible to conceive a more distinguished career for a young man than that. He appeared most enthusiastic in his art; but the question was, Was he competent to carry on the work? No. 1 were rough designs, but still he considered them the work of a man of genius. The committee only stipulated for seven designs, intending to repeat them four times over, there being twenty-eight panels in all; but Mr. Lee was prepared to give them a separate design for every panel, as he did not wish to see the panels multiplied. If they were to take the work out of Mr. Lee's hands he would have a right to complain, as it might be looked upon as a slur on his ability. Again, what would be thought if the execution of the work were entrusted to the gentlemen taking the second or third prize? On the whole, therefore, they had come to the conclusion that, in order to carry out the wishes of the Council to the fullest extent, the execution of the work should be in the hands of the artist himself.

Alderman Samuelson seconded.

Alderman A. B. Forwood said if they were to pass the recommendation the Council would have relegated its entire function to the three gentlemen forming the sub-committee. They were appointed to act as judges for the awarding of the premiums, and not for the carrying out of the successful design. The Council had performed their contract with these gentlemen as regards the designs, and now they were quite free to elect any or none of them to carry out the work. They had to regard the people who saw St. George's Hall; and without a person having a catalogue he certainly would not be able to understand the very visionary and shadowy designs represented by No. 1. If they turned to No. 2, no such catalogue would be needed, as the designs stood out in relief.

Alderman Samuelson: The answer to that is simple. Of course it is impossible to give some persons brains to know what a man means. He maintained that the committee did not exceed its powers.

Mr. J. B. Smith said he would like to know what material these sculptures were to be made of. He supposed the committee had fully considered that point, as they were to be out of doors. He could not but think that in a few years they would be an eyesore rather than otherwise from the dirt that would settle upon them.

Alderman Samuelson said that No. 1 were likely to keep longer clean than those that stood out in bolder relief.

Mr. J. B. Smith: I question whether it is not a great waste of money to put sculptures of that kind out of doors in England.

Mr. P. H. Rathbone thought there was a great deal in what Mr. Smith had said, and that made it all the more important that No. 1 should be selected.

Mr. Whitley thought they ought to be guided by the opinion of the special committee to which the matter was referred.

Mr. Ball asked what would be the probable cost of executing the work?

Sir James Picton said the cost was a matter which would come up hereafter, and no expense would be incurred without first coming before the Council. They had no authority at present for entering into contracts for any amount whatever. The Manchester Town Council were expending 10,000*l.* in the decoration of their great hall with frescoes. He thought a work of that kind should not be taken up in any niggard spirit; and though he did not want to be extravagant, still the work should be done in a manner worthy of the city.

The recommendation was then confirmed.

## THE ROYAL INSTITUTION, MANCHESTER.

THE Royal Institution property is now, by the operation of the new Act, vested in the Corporation. By a clause in the agreement of November 16, 1881, the Society of the Royal Institution have the right of carrying on its usual exhibition of pictures and works of art in the building until the end of the current year, the Society paying all expenses thereof, and receiving all profits therefrom. The Town Clerk has been instructed to forward a copy of the Act to the secretary of the Royal Institution. It is desirable that the selection of the fourteen members of the Art Gallery Committee, to be appointed by the Council on November 9, 1882, should be made prior to that date. The Royal Institution Sub-committee of the Corporation recommend that the fourteen members of the Art Gallery Committee to be appointed by the Council on November 9, 1882, be as follows—viz., the Mayor, Aldermen Baker, Heywood, Bennett, King, Patteson, Worthington, and Thompson; Councillors Schofield, Goldschmidt, Croston, Stewart, Rowley, and Windsor. The Committee also recommend that under the direction of the Mayor arrangements be made for the transfer of the existing policies of insurance on the Royal Institution building and effects to the Corporation by the Act, or otherwise, for the insurance thereof.

On the motion of the Mayor, seconded by Mr. Alderman Thompson, the proceedings of the Committee were approved and confirmed.

## SANDOWN CASTLE.

A PLEA for the preservation of the remains of Sandown Castle, Deal, which are now threatened with destruction, has been raised by Professor Hayer Lewis. He says:—To those who are unacquainted with it I need only quote some few words of the statement which announces the proposed spoliation: "It is one of those grim-looking piles, erected by command of Henry VIII., which still lend an antiquarian charm to our south-eastern coast. The masonry, notwithstanding its great age and the influences to which it has been exposed, is a marvel of good workmanship." I know the castle well. The main outline is very peculiar, and although the upper portion was destroyed years back, the greater part of the substructure is intact, retaining many features which are very interesting. The difficulty will be, not in preserving, but in destroying it. To the townsmen it ought to be an object of the greatest care, for Deal and Walmer Castles have both been converted long since into private residences; the principal church, usually the most attractive building in a town, is graphically described in "Murray" as "a Georgian structure of the most barbaric character"; and although the narrow streets of Deal and its few gabled houses offer some picturesque subjects to the artist, Sandown Castle is the only building of historical and antiquarian interest. The churches of Upper Deal and Walmer have, indeed, remains of twelfth and thirteenth centuries work, but these have been added to and improved by former rectors and churchwardens, whose names are proudly inscribed on the walls in a way so curiously ugly that I can call to mind no specimens which quite equal them. But these curious things are scarcely pleasing, though peculiar; and the one unaltered structure of real interest in or near the town is the one

which it is now proposed to destroy. I trust that this purpose may not be carried out, and that the old castle, mutilated as it is, may be preserved and cared for, were it only to show that our forefathers could build as strongly and as well as the Romans built at Richborough, hard by, and that an engineer of the olden time, in designing even a fort, could show that the beautiful need not be neglected in building the strong.

## CHURCH BUILDING AND RESTORATION.

**Inverkeithney.**—The new parish church has been opened. The style of the building is Gothic, and accommodation is provided for between 400 and 500 persons. The architects were Messrs. A. & W. Reid, of Elgin. Mason-work, Mr. P. Christie (of Messrs. A. Fordyce & Sons, Turriff); carpenter-work, Mr. A. Murdoch, Banff; plaster-work, Mr. A. Ross, Turriff; slater-work, Mr. A. Pirie, Fyvie; plumber-work, Mr. W. Alexander, Keith; and for plaster and glazier work, Mr. A. Chalmers, Banff.

**Bury.**—Considerable damage was done last January to St. Paul's Church, more especially to the windows and painted glass. Works of restoration have now been completed under the direction of Mr. Lawrence Booth, architect, of Manchester. Messrs. Edmundson & Son, of Manchester, restored the windows. A reredos, designed by the architect, has been executed by Messrs. Bonehill & Co., of Manchester.

**Helmsley.**—A chapel of ease has been opened at East Moors. The chapel has been designed by Mr. Wood, architect, and the works have been carried out by Messrs. Todd & Sons, builders, of Helmsley.

**Bilston.**—A new Wesleyan chapel is being built at New Village, the memorial-stones of which have just been laid. Accommodation will be provided for about 550 persons. The architects are Messrs. Loxton & Newman, of Wednesbury; and the builders, Messrs. Bradney & Co., of Wolverhampton.

**Coseley.**—The memorial-stones of a Wesleyan Chapel in course of erection at Woodsetton, have been laid. Messrs. J. Jones, contractors, of Sedgley, are the builders, and the architect is Mr. C. Round, of Tipton. The chapel, together with the school now in course of erection, will cost about 2,000*l*. The chapel will accommodate about 300 persons.

**Grangemouth.**—A new Free church is to be erected at Grangemouth at an estimated cost of 3,600*l*. The building is to accommodate 950 persons. The contractors are—For mason-work, Mr. John Lindsay, Grangemouth; joiner-work, Mr. Alex. Williamson, Grangemouth; slater-work, Mr. James Russell, Grangemouth; and for the iron pillars, Messrs. M. Cockburn & Co., Falkirk.

**Pontresina.**—The English church at Pontresina, in the Engadine, was consecrated by the Bishop of Bedford on August 19. A novel feature in the church is the substitution of wood for stone in the nave arches and clerestory. The plan is a parallelogram, 78 feet by 56 feet. There is no external indication of the chancel, as the site was so limited in length that it was necessary to carry the aisles to the full extent of the ground in order to gain the required accommodation. A porch occupies the second bay on the south side. The side walls are 2 feet 3 inches thick, of rubble with granite dressings; they vary in height as the ground falls rapidly from east to west, so much so, that there is a height of 20 feet below the floor at the west end. This is utilised as a store-room, and could be adapted for warming apparatus. It has wide pointed arches towards the west and at the sides. The style is Pointed, of the simplest character. The church is lighted by lofty triplets at the east and west, and by low coupled lancets at the end; the windows of the clerestory are trefoils pierced through the wood-work, those of the chancel bay are quatrefoils. Internally there are five bays, formed by clustered wooden columns composed of four semicircular shafts with Early English capitals; from these spring smaller shafts supporting the principals of the nave, the wooden arcade, and the principals of the aisle roof. The spandrels are filled with plain boarding—those in the chancel are panelled; the arches are strengthened by struts, the intervening spaces being filled with open tracery. The easternmost bay forms a spacious chancel. A high screen divides the organ-chamber on the north side, and a similarly enclosed screen the vestry on the south side from the chancel. The altar, which is very massive, has six circular columns, with foliated capitals. The church will seat 350 persons. The plans were prepared by Mr. R. P. Pullan, who had designed a smaller church for the same site in 1874, and have been excellently carried out by Mr. Ragatz, of Zurich. H.R.H. the Princess Christian, who has taken the greatest interest in the progress of the church, presented a handsome frontal, executed by the ladies of the South Kensington School of Needlework under Mr. Pullan's superintendence. The Princess also carried out the greater part of the floral decorations for the day's consecration. Mr. and Mrs. Bancroft were liberal contributors to the edifice; they gave the central light of the eastern triplet, and the bell. The Rev. J. W. Ayre presented the jewelled cross. The Rev. J. Nixon gave an ornamental fald-stool.

## NEW BUILDINGS.

**Bodmin.**—The foundation-stone has lately been laid of an extension of the Cornwall Lunatic Asylum at Bodmin. The new building will cost about 12,000*l*., the contract being 11,600*l*.; the excavating and preliminary works having been done. Mr. Marshall, of Plymouth, is the contractor; Mr. Hine, the architect; and Mr. W. J. Jenkin, Bodmin, clerk of the works.

**Bideford.**—The new Bridge Buildings, at the western end of Bideford Longbridge, have been opened. Facing the river are three storeys, the first for the Public Free Library and Reading-room, the second comprising the new Bridge Chamber, while the upper storey is intended for the use of science and art classes. That portion of the building overlooking Allhalland Street is divided into suites of offices suitable for professional men. Provision has also been made for care-taker, bridge officials, &c. The stone used for the walls is from a local quarry; the window jambs, mullions, and ornamental portions being of Ham Hill stone. The buildings have been erected at a cost of about 4,000*l*., the architect being Mr. Bryden, and the contractor Mr. R. T. Hookway, Bideford.

**Newcastle-on-Tyne.**—The Public Free Library in New Bridge Street has been opened. The building is three storeyed, and its length from east to west 167 feet. The building was designed by Mr. Alfred Fowler. It may be remembered that an unsuccessful endeavour was made to preserve the Carlol Tower when the erection of the library was proposed.

**Elland.**—Plans have been prepared for the erection of banking premises for the Lancashire and Yorkshire Bank (Limited) by Messrs. Utley & Gray, architects, Halifax. On the ground floor there will be the bank, 23 feet by 21, also private-room, strong-room, cloak-rooms, dining-room, kitchen, scullery, &c. Upstairs there will be drawing-room, library, bed-rooms, bath-room, &c.; and over these will be additional bed and store rooms. The building is to be Gothic in style; the walls of stone, and the front of Ringby ashlar, with Southowram wallstones, clean cut. The interior woodwork is to be of pitch pine. The contractors are:—Masons, Emanuel Riley & Son, Rishworth; joiner, Joseph Wilson, Elland; slater, Wm. Robinson, Sowerby Bridge; plumber, Joseph Aspinall, Elland; painters, Robinson & Sons, Greetland; and carvers, Rogers & Roberts, Holywell Green.

## SCHOOL BUILDINGS.

**Bloxwich.**—A new school at Elmore Green has been opened. The building forms one wing of a block which it is proposed to build when needed. The building has been erected at a cost of 1,995*l*., and will accommodate 300 children, the total accommodation of the complete building being for 800. Mr. S. Loxton, of Walsall, is the architect, and Mr. A. Lynex, also of Walsall, the builder.

**Wyke.**—The foundation-stone of a Congregational school chapel has been laid at Norwood Green. The inside measurements will be 54 feet by 30 feet, accommodation being provided for 400 persons. Mr. R. F. Rogerson, of Brighouse, is the architect.

**Cheadle Hulme.**—The additional school buildings, which have been erected in commemoration of the twenty-fifth anniversary of the foundation of the Manchester Warehousemen and Clerks' Orphan Schools, Cheadle Hulme, have been opened. The new buildings are a little to the left of the original building. The design is Gothic in character, and in keeping with the architecture of the present institution. The elevations are of red stock brick-work, with stone dressings and terra-cotta strings and label moulds. The accommodation on the ground floor consists of a large central schoolroom with a classroom at each end, divided from the central school by movable partitions. On the first floor is placed a large central schoolroom for the juniors, of the same size as the one below, and at each end are placed the chemical laboratory with apparatus-room adjoining, for the boys on the one side, and a large sewing-room for the girls on the other. The work has been carried out by Messrs. R. Neill & Sons, Manchester, from the designs of Messrs. W. & G. Higginbottom, Manchester. The total cost has been about 4,000*l*.

**Heworth.**—Three groups of schools are at present in course of completion to meet the deficiency of school-accommodation in the Heworth School Board district. Two have been completed, and were opened on Monday last, whilst the third will be opened shortly. The Felling schools are arranged to accommodate 725 children. The building is in two storeys, and the characteristic features of the interior are the large number of classrooms, provided with the facilities that exist for easy and direct supervision by the heads of departments, and the means that are provided to enable all the children to approach and leave their several classrooms without noise or disturbance to the rest of the scholars. Mr. G. Waddell, of Edinburgh, was the contractor. Messrs. Oliver & Leeson, of Newcastle-on-Tyne, are the architects for the three groups of schools.

## GENERAL.

**Mr. Henry Dyer** has resigned the office of Principal of the Imperial College of Engineering at Tokio, which he held during nine years. He has been succeeded by Dr. Divers, but his chair of Engineering remains vacant.

**The Hon. J. C. Dundas, M.P.**, Lord-Lieutenant of the county of Orkney and Shetland, has intimated his intention of presenting one of the stained-glass windows in the front of the Lerwick Town Hall. The subjects that have been selected are King Harold Hardrada of Norway and Earl Magnus, to whom the cathedral of Kirkwall is dedicated.

**Mr. J. Dixon**, of London, has obtained the contract for the rebuilding of the Solway Viaduct which was destroyed about eighteen months ago. The contract price is about 30,000*l*.

**The Duke of Westminster** has offered to bear the expense of the rebuilding of the tower of St. John's Church, Chester, which fell last year, as well as providing for the cost of new schools for the parish.

**Mr. Edgar Bruce**, it is stated, is about to build a theatre at the top of the Haymarket.

**Mr. Clement John Heaton** (son of the late Mr. Clement Heaton) has become a partner in the firm of Messrs. Heaton, Butler & Bayne, the well-known artists in stained glass and other decoration.

**The Bishop of St. David's** has reopened the parish church of Llandawke, a Norman building of great antiquity, which for years has been in a most ruinous and dangerous condition. The parish is only 620 acres in extent, while the population all told is only twenty-one.

**The Portrait of Mr. Galbraith**, ex-Lord Provost of Glasgow, painted by Mr. Norman Macbeth, R.S.A., has been presented to the authorities of that city for the recently-formed Lord Provosts' Gallery.

**Mr. C. L. Clare** has presented to the Peel Park Museum, at Salford, five cases containing impressions of all the Great Seals of England, from the time of Edward the Confessor up to the present time, and also a case containing 187 impressions of university, monastic, and county seals.

**The Parish of Perivale**, near Ealing, contains only five houses and thirty-four inhabitants, being the smallest parish in the diocese of London and one of the smallest in England.

**The Southwell Bishopric Fund** has reached 35,296*l*. Of this sum Lincolnshire has contributed 8,707*l*.; Nottinghamshire, 5,217*l*.; Staffordshire, 4,729*l*.; Derbyshire, 3,280*l*.; and Shropshire, 4,865*l*. It is estimated the general fund will yield 2,800*l*. and that the general committee will grant 5,000*l*.

**The Local Board of Eastbourne** having entered into a contract for the lighting of the principal thoroughfares by electricity, the sea-front was on Saturday illuminated by the new light.

**The Kirkcaldy Fine Art Association** opened their eleventh annual exhibition on Monday. Out of 1,175 paintings, room has been found for 958. A larger number of water-colours than usual is exhibited, and among them specimens of Sir John Gilbert's and Birket Foster's works. The Association has up to the present time been the means of disposing of works of art to the value of 10,000*l*.

**The Ancient Church of St. Mary, Hoo**, near Rochester, is being restored under the direction of Mr. E. W. Stephens, F.R.I.B.A., of Maidstone.

**A Fine Art Exhibition** in connection with the School of Art, Hensburgh, was opened on Saturday. Among the exhibits is Gérôme's picture of the *Prisoner of the Nile*, from Skelmorlie Castle.

**The Canadian Pacific Railway** is now laid for a distance of 350 miles from Winnipeg. Telegraphic construction is being pushed on concurrently with the work of the railway. Two hundred miles of rail have been constructed during the last three months.

**The Roman Villa at Brading**, being now entirely in possession of Lady Oglander, further explorations of the remains are to be conducted by Messrs. Hilton & Price, with the assistance of Captain Thorpe.

**A Syndicate of London Capitalists** have contracted with the Canton of Geneva for the construction of an electric railway, on the Edison system, between Geneva and Fernex, and Fernex and St. Julien, in the Savoy, a distance of about twenty kilometres.

**The Newcastle Society of Antiquaries** have formed a committee for the purpose of sketching and photographing buildings of interest erected in Newcastle and Gateshead previous to the year 1700.

**The Corner-stone** of a new wing to the Albert Memorial Museum at Exeter, was laid last week. Messrs. Stephens & Bastow, of Bristol, are the contractors for the work; Messrs. Hayward & Sons being the architects.

**The Worcestershire Exhibition** has cost about 7,000*l*. The receipts up to August 26 amounted to 4,500*l*., leaving a balance of 2,500*l*. to be made up.

**A Statue of the late Mr. Macdonald, M.P.**, is to be placed in the Miners' Hall, Durham.

**The Liverpool Town Council** on Wednesday approved of a motion of Sir James Picton's, that a sum of 2,000*l*. should be placed at disposal for works of art during the current year, the money itself being earned by the autumn exhibition. The purchase of the following pictures has been agreed to: *A Street in Brittany*, by Stanhope A. Forbes; and *On the Moray Firth*, by John Fraser.

**The Derby Art Gallery** is so far completed that it is intended to open it next month or early in November.

**Two of the Bronze Panels** for the base of the Temple Bar Memorial have been fixed during the week. They have been executed by Messrs. Mabey, of Westminster.

**Brentor Bridge**, which crosses the Great Western Railway near Lidford, had been condemned for traffic, and was taken down on Sunday and cleared away without delaying the railway service. An iron girder bridge will take its place.

**The Kidderminster Board of Guardians** have received five sets of plans sent in for alteration and extension of the work-house.

**The Bridge of Weir Orphan Homes** have been completed by the dedication on Tuesday of the new invalid home. Mr. Quarrier, who has spent over 26,000*l*. on the building, intends to transplant the Emigration Homes at Govan Road, Glasgow, to Bridge of Weir, which will entail an additional expenditure of 12,000*l*.

**Sir Charles Freahe** has placed a portion of the Town Hall Buildings, Twickenham, at the disposal of the Free Library Council for the purposes of a library until the Council are in a position to erect a permanent structure. The hall was erected a few years ago by Sir Charles Freahe for the benefit of the townspeople of Twickenham.

**The Electric Light** was successfully supplied by Mr. Edison on Sunday night, from a single source, to the houses in a district of New York occupying a square mile.

**The Stockton-on-Tees Corporation** on Tuesday decided that the arched bridge across the Tees should be carried out as originally designed.

**Ashturton Church Restoration** will be commenced early next spring by Mr. Abley of Salisbury, under the direction of the architect, Mr. A. E. Street, M.A. Mr. Abley, whose tender for the work was accepted, declined to be bound by his tender, as the committee required the work to be carried out in sections; the committee have, however, now withdrawn this condition.

**The Philharmonic Theatre**, Islington, was destroyed by fire on Wednesday morning.

**The Bengal Ironworks** have been purchased by the Indian Government for the sum of 430,761 rs., and the Viceroy now announces that his Council will be ready to transfer them for that sum, together with any further indispensable outlay, to any parties who may establish satisfactorily that they are in possession of sufficient skill and resources, and who are prepared to carry on the manufacture of iron and steel upon a scale commensurate with the probable needs of that portion of British India which is within a reasonable distance of the works.

**The Liverpool Art Exhibition.**—Over 1,500 persons attended the "private view" of the collection of pictures and sculpture in this season's autumn exhibition, held in the Walker Art Gallery, under the auspices of the Liverpool Corporation, and 91 pictures were sold, realising 1,328*l*. The collection comprises 826 oil-paintings, 741 water-colour drawings, and 38 pieces of sculpture. Sir F. Leighton's *Phryne* occupies a prominent place in one of the rooms.

**The Late Louis Rubio.**—The *Times* Geneva correspondent writes:—"Louis Rubio, in his day a painter of high repute, though born at Rome of a Spanish father and an Italian mother, was a Genevan by adoption, and executed here some of his principal works. After studying his art for some time in the city of his birth, he went to Paris and completed his artistic education in the studio of the celebrated Léon Cogniet, who became one of his fastest friends. He next travelled in Italy and France, and finally settled at Geneva, where he remained until his removal, a few years ago, to Florence, where he died on August 2 at the age of 82. His works are to be found all over Europe, as well in public galleries as in private collections. Among the principal of them are *Priam at the feet of Achilles*, *The Samaritan*, and *The Marriage of Salvator Rosa*, all of which are at the Grand Trianon. His *Marie Stuart* is at the Rouen Museum; his *Siege of Brussels* at Versailles; and all the decorations, in the Byzantine style, of the Russian Chapel at Paris were executed by this artist. Two pictures, which he painted at Geneva, *Van Dyck quitting Patellier de Rubens*, and *Le Tasse lisant sa Jérusalem délivrée devant la Princesse Eléonore d'Este*, have been made widely known through the medium of engravings."

# The Architect.

## ARCHITECTURAL FRENZY IN THE NEW WORLD.

ON this side of the Atlantic the miscellaneous Anglo-Saxon writer of our latter part of the nineteenth century has been pleased from time to time to run amuck upon architectural questions in a most peculiar way; not at all in an unintellectual or inartistic way, but in a way which might be called, if we were so minded, by any one of

half-a-dozen handy phrases suggestive of lightheadedness. Fun has of course been the principal weapon in his hand; and sometimes very good fun it has been of its kind, hitting hard and straight at the mark; but inasmuch as the mark has been quite as often a delusion as not, and still oftener at least a whimsey, it cannot be said that the practical result has been worthy of the expenditure of so large an amount of wit. Architects as a rule do not trouble themselves to read with any marked attention such disquisitions concerning their business. The public at large also, who are the employers of the architects, are still less disposed to flounder through the obscurities of the argument. Practical men perform their practical work in the old way; and, from the brilliant transcendentalism of Mr. RUSKIN to the prosaic infatuation of the inventor of the "Inspired Mason" in the *Quarterly*, the assault has entirely failed, and the design of our buildings is very much what it would have been if Grub Street had left it alone.

It need scarcely be observed, however, that the fever of hypercriticism is a contagious disease; and accordingly no one need be surprised to find the *North American Review* publishing a lengthy and excited article in which an American writer denounces American architecture in the same style of rhetoric with which we are familiar in England. The writer is Mr. CLARENCE COOK, and such of our readers as have returned from their holiday in a sufficiently pleasant humour may have enjoyed not a little the racy extract which we reprinted last week from this gentleman's essay. Those who have not yet read it we recommend to do so without further loss of time, for the lesson it teaches is indeed instructive as well as amusing.

It will thus be seen that in the United States, as in England, the architect is easily proved to be a sad blockhead, and his work very sorry stuff. The leading point in the American reviewer's argument is, as many might suppose, although many might not, a reference to the superior genius of antiquity. This artifice is pretty much exhausted in England; but it is new in America, and very probably may prove highly attractive there. On this side the ocean, not only have we ceased to hark back to Greece and Rome, or even to new-born Italy, but our own stately monks and saintly freemasons of the Middle Ages—if stately and saintly they really were—we have at length in some degree consigned to the same limbo of exhausted fashion; and what we have come to fancy now more than all else is the higgledy-piggledy of the STUARTS. Now if it happens that there is Stuart architecture of as veritable a kind on the other side as there is on this, it is plain without explanation that such art must happily combine in that part of the world the two great critical virtues of antiquity and fashion. That is to say, when we in England go back to the invasion of Norman WILLIAM and his rowdy followers, the corresponding reference in America is to the grim and sober-sided people who "came over in the *Mayflower*," seeking refuge, it will be remembered, in the wilderness from the theological discipline of King CHARLES of jovial but disreputable memory; and so we may expect to find the architecture of the Pilgrim Fathers to be authentic "Queen Anne." Not only so, but when the old Hollanders built New Amsterdam—the city which some of our readers may require to be told is now called New York—it must be equally true that their architectural style would be of very much the same type. Accordingly, when Mr. CLARENCE COOK conceives the happy thought of appealing to "the handsome houses in Gloucester, Hingham, Cambridge, and other Massachusetts towns, the houses that made old New York so

dignified a city, and those that still give to little Newport an air of consequence," he is not only in the fairest possible manner putting KNICKERBOCKER in the place of WILLIAM THE CONQUEROR, but he is at the same time accepting for Queen Anne here Queen Anne there—a proceeding which is doubly convenient, interesting, and authoritative. But the Transatlantic critic is far too acute to stop here, as an Englishman might do—at least, any other Englishman than such a one as the discoverer of the Inspired Mason. Those delightful examples of antique art, he says, "were the work of simple 'builders,' who knew their trade and never cared to give themselves a finer name." Very likely they were; and what then? The conclusion is obvious. "Where architects abound," he continues, "the art of building always deteriorates. Did architects design the houses of Venice? Architects may have designed the bad ones, but never the good ones. As soon as architects got themselves fairly established in Venice, her shabby days began." With all respect for the humour of Mr. CLARENCE COOK, we are bound to suggest that he is here drawing upon his imagination for his facts. If he merely intends to assert that the work of the Renaissance in Venice is inferior to the pre-Raphaelite work, that is a matter of opinion which for a good many years has been held to be beyond the range of profitable argument, people of different artistic proclivities being entitled so far to agree, or disagree, to differ. But our critic goes on to illustrate his meaning a little further: "Consider the cottages of England, the chalets of Switzerland; is it not evident that they are the spontaneous outgrowth of a general good taste" and so on? Consider, of course, the lilies of the field, how they grow; they toil not, neither do they spin; yet SOLOMON in all his glory is not arrayed like one of these. "Every old church in England looks built by the same hands that built the old houses that nestle about it." A pretty fancy, we grant, especially for an American; a tender thought, by no means to be discouraged or disparaged; or we might be obliged to urge the reflection that threescore years and ten would have to be repeated in some instances a good many times before the same hands that had begun their work upon a village church of the twelfth or thirteenth, or even the fifteenth century, could have finished it upon the poor slap-dashed dwellings that are rickety and old in the eighteen hundred and eighties, after an existence of scarcely a century and a half. The identification is in truth no more than a recognition of the fact that distance still lends enchantment to the view; once beyond the limits of substantial common sense, and it matters not whether the quaintness of such old houses be that of a hundred years or that of a thousand. But whether this is sound criticism, or even intelligent archaeology, is quite another question. "It is to architects," continues the new apostle at any rate, "that we owe all the ugly building that offends us;" and this is the proposition which he wishes to demonstrate by such reasoning. It is true that it could scarcely be demonstrated by any other.

After our own manner, but with a freedom of personal animadversion which no Englishman could hope to emulate, and which is therefore all the more refreshing, Mr. CLARENCE COOK, having thus laid down the law, proceeds to exemplify its operation by describing the actual specimens of architectural art which claim to be most popular in his great country. "A builder," he observes, more in sorrow, but a good deal in anger, "must call himself an architect before he can be employed in any important work to-day. The man—I forget his name—" (what a pity he forgets his name!) "who built Mr. A. T. STEWART's house and iron shop, and many a structure beside, was called an architect." Architects also—with forgotten names—have built certain churches about Boston; "and another architect built the church in that Back Bay quarter, dedicated, we suppose, to some female saint, since it has for emblem on the top the completest Saratoga trunk"—and so on; a Saratoga trunk being, it is to be supposed, the very large travelling box, and nothing else, in which an American fine lady takes her dresses to the famous springs. Still another architect has built "the Art Museum, so finikin fine," which is adorned with "heads of great men looking out of portholes in the most shipwrecked fashion, a senseless treatment borrowed from that overdone Pavian Certosa." "Borrowing, borrowing everywhere!" is the Carlylese cry of the critic, "an original motive almost impossible to find;" and now there follows at last this suggestive reflection:—"For the people at large have no ideas on the subject; the 'builders' have been snubbed into taking a back seat and keeping it; and

in architecture, as in all our fine arts, notably in the art of painting, the field has fallen into the possession of a *set of clever, accomplished, but over-cultivated young men*, who have come back from French and English studios, offices, and pedestrian trips, with a plenty of 'material' in their sketch-books," which, in short, although all very well in its way, is of no use in America. But why of no use in America?

Mr. CLARENCE COOK, whether in affectation or in reality, seems to be only playing the part, after all, of one of those growling patriots who are to be met with in every land, and whose simple and easy function it is to cry up the imaginary excellence of the "good old times." Fancy this old-maidish whim having at length got so far as to insist upon the worship of such an idol as the architecture of the godly men who "came over in the *Mayflower*!" Fancy the churches of all America tied down for ever to the pattern of the conventicles in which COTTON MATHER expounded the mysteries of witchcraft! We venture to express the hope that American architects will pay no attention to Mr. CLARENCE COOK; that the clever and accomplished young men who have gone home from French studios and English offices, with "a plenty of material," will by no means consent to imitate the barren work of primitive Yankee builders, but go on their way rejoicing in the fact that they are doing good work for their country, and better and better every day.

### WATTEAU.

THE poet of the eighteenth century is WATTEAU, writes EDMOND DE GONCOURT, whose singular good fortune it has been to have discovered the original manuscript of the Comte DE CAYLUS' biography of that artist among old papers bought by the pound of a "bouquiniste" in the Arcade Colbert, Paris. The manuscript is bound in calf, and bears the lilies of France on the back and side pieces. The title stamped thereon is "Conférences et détails d'Administration de l'Académie Royale de peinture et de sculpture : MDCCXLVIII." The first document the volume contains is a report of the proceedings of the Academy during the year 1748; next are speeches by CUYPEL, painter in ordinary to the King, and biographer of several of the Academicians, as, for example, of EUSTACHE LESUEUR, LEMOYNE the sculptor, and lastly of WATTEAU, by the Comte DE CAYLUS, each countersigned and certified by LÉPICIE, perpetual secretary to the Academy. The discovery of this lost volume was an event in the annals of French art, for MM. DUSSIEUX and SOUHÉ, who edited the memoirs of all the members of the Academy of Painting and Sculpture, were compelled to omit that of WATTEAU, in consequence of the volume discovered by M. DE GONCOURT having been stolen from the archives of the Academy.

WATTEAU created a style. He has had a host of imitators, but not a single rival. Essentially a poet, he threw on canvas the enchanted visions of his fervid imagination, thus creating an ideal world, all caprice, fancy, and poetry, as did SHAKESPEARE when he wrote "Midsummer Night's Dream." WATTEAU revived that peculiar and refined elegance in style which had been lost in the heavy magnificence of LOUIS XIV.'s reign. The grace, of which WATTEAU's brush is the exponent, was not copied from the antique. It is something yet more subtle, to be felt rather than defined in the pose of a figure, the profile of a face, the coquetry of an attitude, the folds of a woman's skirt. This poetic grace WATTEAU stereotyped on canvas as effectually as did the melted lava the breast of DIOMEDE's wife in the ashes of Pompeii. But not alone in the delineation of the human form does the pencil of WATTEAU express grace. His landscapes, luminous in the lovely light of a summer's day, are poems on canvas. The woods which form the background of his pictures have a freshness of verdure not one of WATTEAU's school discovered the secret of reproducing. The statues beneath their shadow insensibly lead the eye to one of those distances, mysteries of receding landscape, lost in the haze of a luminous glow, blending on the horizon with all the glory of a summer sky. In the foreground how graceful are the groups of revellers: a Harlequin, Pierrot, a Gilles, and a Scapin, *e tutti quanti*—some masked, some unmasked—surround a Columbine, the rose tint of whose *sacque* catches a sunbeam which plays on the sheen of the satin, showing every fold of its cunningly-devised drapery; she flirts her fan with a grace queens envy; musicians, in the fantastic garb of *les comédiens du roy*, accompany on guitar and

tambourine Gilles and Columbine as they sing their eternal refrain, "Enfants d'une bouche vermeille."

ANTOINE WATTEAU was the son of a poor tiler of the town of Valenciennes. The registry of his birth, spelt in defiance of rule or custom, informs us that the event occurred on October 10, 1684. The father of the lad, born within two years of Madame DE SEVIGNÉ's death, was a man of violent temper. It was his ambition that his boy should follow his trade, which had been that of his forefathers, but the lad's vocation was strangely marked. After a long struggle against ANTOINE's desire to study art, the tiler consented to his entering the *atelier* of JACQUES ALBERT GÉRIN, the painter of civic festivals and other ceremonies of the town of Valenciennes, a great man in his own city, but utterly incapable of instructing a future WATTEAU. Escaping sometimes from GÉRIN's studio, the boy would stand at the corner of the "place" on a market-day, and sketch the comic scenes which caught his eye. These he sold for a few pence to the mountebanks and jugglers who frequented country towns. The tiler, however, finding that ANTOINE's studies under GÉRIN contributed naught to the housekeeping, refused to continue the small stipend required for his maintenance, although he was well off for his class, possessing a house of his own, which he let, and, moreover, inhabiting one he built himself within the enclosure belonging to the Abbey of St. John. The lad, rather than return to his home, resolved to start in life on his own account, and walked from Valenciennes to Paris, without a change of clothes or a single sou in his pocket. He sold drawings by the way for bread, and reached the great city, weary and footsore, towards the end of 1702. He was therefore eighteen. *Peu savant* and penniless, as his chronicler remarks, he wandered on to the Pont-Neuf, on each side of which bridge in those days sellers of religious images and Holy Families had stalls. To one of these, MÉTAYER by name, he showed a sketch, who instantly engaged him as one of his pupils—or rather workmen—for the man's house was a manufactory rather than a studio. Each poor fellow had his appointed task. One painted skies, a second heads, a third draperies, while to the most expert was entrusted the putting in of the high lights. WATTEAU speedily became a favourite with his employer, inasmuch as he proved capable of all of these functions. The drawings were turned out at so much the dozen. WATTEAU worked by the day. On one occasion the old wife of his employer, who had carefully put the original of the drawing ANTOINE was to make a copy of under lock and key, not seeing the lad at his usual place at eight o'clock, received him with a volley of abuse when he put in an appearance at twelve. ANTOINE, with a simple air, drew a finished copy from his pocket, executed from memory, of GÉRARD DOW's old woman reading, a subject much in vogue at the time, and told the irate beldame he only wanted to see the original in order to put the spectacles on the old woman's nose, which he had forgotten. Alluding to those days in later life, WATTEAU said: "My Saint Nicolases were my chief successes; I knew my Saint Nicolas by heart, and did without the original." For this uncongenial work MÉTAYER gave the lad half-a-crown a week; it is true that for charity sake he sometimes gave him a little soup. The hours WATTEAU could snatch from sleep he spent in the gardens of the Luxembourg, in order to sketch the fine old trees there. He would draw the same group at different hours, in order to study the effect of light on the foliage. In many of his pictures one can trace a reminiscence of that stately plaisance, which in his time was the residence of some of the Royal Family. By a lucky chance GILLOT saw one of the sketches thus taken in the early hours of a summer morning. At once discerning genius in the style, he sought out the lad, and invited him to study in his *atelier* and live in his house. GILLOT had been recently admitted to the Academy as Associate. He had begun his career as a decorative artist, but had abandoned that part of his profession for subjects drawn from Italian comedy, many of which have been preserved in the Louvre. This invitation, eagerly accepted, proved the turning-point of WATTEAU's life. GILLOT's style—so graceful and exquisite in poetic fancy, and often comic—coincided with the natural bent of his mind. A phase of art of which the son of the Valenciennes tiler had no conception was revealed to him, and which undoubtedly influenced his future compositions. Again and again we find the Italian comedians forming the subject of his pictures. He painted their flight when ordered to quit Paris at the instigation of the severe MAINTENON; he

painted their amusements, their serenades by torchlight, their *vacances* in the country, &c. On hundreds of panels preserved in the old châteaux of France we find a Columbine and Mezzetin disporting themselves by the banks of some pool, frightening the winged denizens of a farmyard by their antics. Not only in the productions of his brush but in the nature of GILLOT there was a strange affinity with that of the young student, an affinity which, by some mysterious fatality, proved the cause of their separation. Master and pupil quarrelled. Not only did WATTEAU quit his new home, but he induced his fellow-pupil LANCRET to leave GILLOT's *atelier*. He said later on to GERSAINT the picture-dealer, "I advised LANCRET to form his style by the study of Nature, which he accordingly did." If LANCRET was not, he has been supposed to be a pupil of WATTEAU; when the latter had attained notoriety LANCRET undoubtedly studied his manner and sought his counsel. WATTEAU was never induced to reveal the cause of his abrupt departure from GILLOT's house, and even resented any attempt made by his friends to ascertain the cause of the rupture. To the end of his life he praised GILLOT's works, and acknowledged the service his teaching had rendered him. It has been surmised that GILLOT became jealous of a pupil he foresaw would outstrip him in genius. Certain it is that GILLOT never touched brush or palette, and devoted the remainder of his days to the art of etching, in which he excelled, as is proved by his illustrations of LA MOTTE's Fables.

CLAUDE AUDRAN, who occupied the responsible position of guardian at the palace of the Luxembourg, hospitably offered WATTEAU a home after the quarrel which deprived him of GILLOT's friendship. CLAUDE was a man of intuitive as well as acquired taste. If not as gifted as those of his family who had been admitted to the Academy, he was still no mean artist himself, and had specially made decoration his study, having formed his taste on RAPHAEL's loggie at the Vatican and PRIMATICCIO's work at Fontainebleau. To CLAUDE AUDRAN was due the revival of the arabesque style adorned by figures, animals, and birds. AUDRAN formed WATTEAU's style in decorative art. It was while with him that WATTEAU acquired the inimitable lightness of touch and delicacy of execution so remarkable in the panels on a white ground, belonging to M. DE LA BÉRAUDIÈRE, exhibited at the Arts Décoratifs in 1880. These were but specimens of many carefully preserved in châteaux belonging to the old French nobility. The Duc DE MAERNAIS possesses a series on a gold ground, wherein butterflies, birds, and flowers are drawn with an almost aerial delicacy. AUDRAN had decorated the Menagerie of Versailles, by royal command. His work on the ceilings of several rooms in the palace of Meudon, destroyed by fire during the Franco-German war, proved how capable he was to form the style of the rising genius. While residing in the palace of the Luxembourg WATTEAU made RUBENS his special study. The series of pictures bearing on the life of Queen MARIE DE MEDICI, now in the Louvre, then decorated the palace for which they were painted.

His first picture of importance was painted by WATTEAU at this period and shown to AUDRAN, who recognised the touch of genius in the composition, which was afterwards engraved by COCHIN; but AUDRAN, jealous of the superior merit of his pupil, told him that he had better keep to ornament, as the work was utterly without merit. At this time young WATTEAU wished to return for a brief period to visit his family at Valenciennes, and sold it the painting for 60 fr., with which sum he accomplished his journey, which was a mere pretext for breaking with AUDRAN, from whom he had learnt all that that excellent man could teach. Desirous of studying the ancient masters in Italy, he wished to compete for the Academy prize and be sent to Rome at the expense of the society. He accordingly deposited two paintings—subsequently purchased by LORANGÈRE—in the *salle* of the exhibition on the day when the examination took place, and anxiously awaited the result. M. DE LA FOSSE passing by, struck by their vigorous tone and harmony of composition, sent for young WATTEAU. Timid and somewhat awkward in manner, he appeared almost ashamed of his own talent, but summoned courage to ask M. DE LA FOSSE to endeavour to induce the Academy to send him to Rome. "My friend," said M. DE LA FOSSE, "you are not aware of the talent you are endowed with; take my word for it, you know far more than many among ourselves. We of the Academy will esteem it an honour to receive you. Take the

necessary steps; we shall consider you as one of us." WATTEAU bowed, paid the usual visit to each Academician, and was received as Associate. The legal document is extant, and in it we find that ANTOINE WATTEAU took the oath in presence of CUYPEL, "Premier peintre du Roy et de Monseigneur le Duc D'ORLÉANS."

WATTEAU, like BYRON, awoke next morning to find himself famous. He was overwhelmed by orders. Perhaps the art patron who had the most important influence on his future career was the celebrated financier and banker, CROZAT, whose hotel covered the space now occupied from the Rue de Choiseul to the Rue de Richelieu by the Italian Opera-house. CROZAT's granddaughter married the Prime Minister of LOUIS XV., and inherited, besides his enormous fortune, his picture gallery, subsequently known as the Choiseul Gallery. M. CROZAT not only devoted fabulous sums to the collection of the finest works of the old masters, but invited artists from all parts of Europe to decorate his magnificent residence. Thus it came to pass that ROSALBA CARRERA, the Venetian painter, executed her finest portraits during the two years she was the honoured guest of M. CROZAT, as was also her sister and brother-in-law. M. CROZAT was not only the MÆCENAS of the day; he enjoyed the society of artists, and invited WATTEAU to take up his abode at his princely hotel, an invitation WATTEAU accepted more on account of the art treasures he would have the opportunity of studying than because of the luxurious table kept up by his munificent patron. Most especially was M. CROZAT's collection rich in original drawings of the early Italian masters. GIACOMO BASSANO's afforded WATTEAU great delight, as also those of VANDYCK and RUBENS, many of which may now be seen in the "Galerie de Dessin" at the Louvre. WATTEAU made the trees and backgrounds of TITIAN's and CAMPAGNOLO's works his special study: the grandeur of composition of the paintings of the old masters filled him with admiration, but not with any desire to follow in their track. It was while the guest of M. CROZAT that WATTEAU painted *Les Quatre Saisons* for the decoration of his dining-room. M. DE GONCOURT is the fortunate possessor of the original drawings of the figures of Spring and Autumn. It was at the Hôtel Crozat he formed the friendship of the Comte DE CAYLUS, M. DE JULLIENNE, M. HENIN, who to the end of his brief career proved his steady friends and patrons. So captivated were DE CAYLUS and HENIN by his genius, that they procured from Italy copies of the landscapes of the most celebrated old masters, in order that he should form an idea of their style. "These," remarks the Comte, "we had executed as rapidly as possible, and roughly finished; we also sent to Holland for similar copies of the chief landscape painters of the Dutch school, so that he should be enabled to judge of the general effect of these works. Our orders were rapidly executed, for WATTEAU's nature was nervous and excitable; once he formed a wish, he was impatient to accomplish it. He was delighted by our effort to render him a service, and thoroughly appreciated the result."

A portrait of WATTEAU, executed at this period, was sold in March 1875 at the DE VIGNIÈRES auction. In it he is seated at a table, and holds a compass. His wig is short and curled, his coat is furred. His expression has something naïf, and perhaps a little bourgeois. His portrait by BOUCHER, taken a few years later, is more indicative of his nervous and somewhat cantankerous nature. WATTEAU was early in life attacked by the disease which carried him off at so early an age. BOUCHER's portrait conveys the idea of a thin man emaciated by suffering; his expression is restless and dissatisfied. The same expression may be noticed in OPPENORT's portrait, engraved in a medallion form, surrounded by genii bearing the attributes of painting, and surmounted by an eagle holding the trumpet of Fame in his talons. WATTEAU was careless in his attire and slovenly in the arrangements of his painting-room. He rarely cleaned his palette, and even neglected for days to renew the colours on it. His oil-pot, of which he made perhaps too much use, was full of dust, and gradually became discoloured by all the paints from the brushes he continually dipped into it. In this carelessness WATTEAU differed essentially from GÉRARD Dow for instance, who ground his colours on a piece of looking-glass, which he carefully cleaned before putting them on it, lest the slightest particle of dust should become mixed with them; GÉRARD Dow cleaned his palette himself, not even entrusting this duty to his old retainer. WATTEAU retained the child-

like simplicity of his nature even in the midst of the immense popularity he acquired. On one occasion his hairdresser brought him a new wig. The man took advantage of the occasion, and in reply to the inquiry as to its price, said a few studies would satisfy him. WATTEAU thought he had never had so cheap a wig, and presented the man with two drawings, perhaps the most piquant he had ever done. The Comte DE CAYLUS happening to pay him a visit shortly after the bargain was concluded, found WATTEAU disturbed in mind as to whether he had adequately remunerated the hairdresser.

(To be continued.)

#### ASPECTS OF MR. RUSKIN'S TEACHINGS.\*

AS the name of Mr. RUSKIN's publisher appears on the title-page of the pamphlet which is intended to be an introduction to his works, we may surmise that the compilation has secured his sanction. If so, it suggests another change in Mr. RUSKIN's opinions. Shilling pamphlets filled with the "beauties" of his books would be supposed to be contrary to his theory of authorship and publication. He has before now announced that he did not care for anybody reading his books who grudged him a doctor's fee. Accordingly his tariff is 18s. for plain volumes, and 17. 7s. 6d. for illustrated ones; so that by the addition of commissions the price may correspond with the physician's fee. The fact seems to have been overlooked, in this analogy seeking, that there are multitudes of people who are unable to pay guinea fees, and that skilful doctors are compelled to accept much smaller sums, and very often to receive them in instalments. Mr. RUSKIN's ideal is a fashionable physician, and those who have recourse to him must be rich. He has not aided in the diffusion among the great body of his countrymen, of such knowledge as is to be found in his books. On one occasion he allowed a selection of the passages relating to Gothic architecture to be printed as a fourpenny tract for the benefit of a workmen's society, but under arrangements by which only a few people could be benefited. Mr. RUSKIN is the only English author of note unrepresented among the "cheap editions." While his books are esteemed by men who love uncut copies, and who consider it a kind of profanity to read a book, they are unknown to millions of his Englishmen. The consequence is, that although Mr. RUSKIN has been writing and publishing for nearly forty years, it is found necessary to explain his thought and teachings. It is no wonder that Mr. RUSKIN is humbled when he considers the mystery of life. In one of his early essays he tells us that "it now needs both curious fortune and vigorous effort to give to any, even the greatest, such early positions of eminence and audience as may feed their force with advantage;" those conditions fortunately belonged to him, and what is the result? His books have become "precious," but in a different sense from what was intended; they are regarded as curiosities, which may be placed in a cabinet with old china, the owners having the comfortable assurance that the value of the books is rising, and that they will fetch more than was paid for them.

It would be a public gain if more could be known about the teachings of Mr. RUSKIN, but we fear that little knowledge is to be derived from the pamphlet before us. This defect does not arise from the carelessness or ignorance of the compiler; it is owing rather to the process employed. Distilled books, says BACON, are like common distilled waters, flashy things. That author must be verbose who will bear to be reduced; one might as well attempt to give the essence of a picture or a statue; and Mr. RUSKIN's volumes are too carefully constructed to be exhibited fairly in the compass of a pamphlet. It is only from a volume like the "Selections," which appeared several years ago, that a notion may be obtained of his manner of thinking, but the book, although supposed to be popular, is not to be had without paying five or six times the published price. The task undertaken by Mr. BAILLIE is therefore of surpassing difficulty, for he attempts in about fifty pages to explain what Mr. RUSKIN has said in numerous volumes about Style, Reading, Education, Art, Science, Labour, Commerce, Political Economy, Woman, Ethics, and Religion. But no compressive force could reduce the subjects of the pamphlet to the size of an article.

Mr. BAILLIE, after his introduction, begins with a considera-

tion of Mr. RUSKIN's style, and with good reason, for the success of "Modern Painters" and the "Seven Lamps" and "Stones of Venice," was in a great measure owing to the style in which the thoughts were expressed. In his early days Mr. RUSKIN was not free from rhetorical mannerisms which he must now abhor. Mr. BAILLIE tells us that Mr. RUSKIN has "only one standard for the measure of his utterance," and that his writings will bear the test which he suggests for a good style, as they show choice of the fewest and simplest words that can be found, emphatic and clear utterance, absolute spontaneity, melody, &c. But Mr. RUSKIN's standard now is so different from that which was followed by him thirty years ago as to suggest a great mental revolution. "I have had," he once wrote, "what in many respects I boldly call the misfortune, to set my words sometimes prettily together, not without a foolish vanity in the poor knack that I had of doing so, until I was heavily punished for this pride by finding that many people thought of the words only and cared nothing for their meaning. Happily, therefore, the power of using such pleasant language—if indeed it ever were mine—is passing away from me; and whatever I am now able to say at all I find myself forced to say with great plainness." It would be interesting to ascertain whether Mr. RUSKIN's change of style has been followed by any increase of his influence, or whether he has really succeeded, as he supposes, in compelling in students "a clearness of thought and precision of language which have hitherto been in nowise the virtues or skills of scientific persons." If it be borne in mind that, with all his powers of observation, Mr. RUSKIN has not been able to enrich science by a discovery however humble, and that not one of his attempts in treating of scientific matters is found to be adapted to the requirements of students, the superior virtue and skill which he claims for his own writings are not so evident as he and his disciples imagine. Mr. RUSKIN's latest writings may compare with SWIFT's as examples of "the plain style"; but it would have been better if he eschewed pharisaisms with as much rigour as he has struck out ornaments. What has he done to authorise this assumption of superiority in clearness and precision over such writers as HERSCHELL, LYELL, TYNDALL, HUXLEY, and others?

In the next chapter we are introduced to Mr. RUSKIN's theory of reading, and which may be represented by the one word "accuracy." "You might read," he says, "all the books in the British Museum (if you could live long enough), and remain an utterly illiterate, uneducated person; but if you read ten pages of a good book, letter by letter—that is to say, with real accuracy—you are for evermore in some measure an educated person. The entire difference between education and non-education (as regards the merely intellectual part of it) consists in this accuracy." This chapter is followed by one on education. Men's business in this world, according to Mr. RUSKIN, is (1) to know themselves and the existing state of things with which they have to do; (2) to be happy in themselves and the existing state of things so far as either are marred or mendable; (3) to mend themselves and the existing state of things, so far as either are marred or mendable. In the "Stones of Venice" the formula was differently expressed, and ran as follows:—"It might be matter of dispute what processes have the greatest effect in developing the intellect; but it can hardly be disputed what facts it is most advisable that a man entering into life should accurately know. I believe in brief that he ought to know three things: First, Where he is; Secondly, Where he is going; Thirdly, What he had best do under those circumstances." The defects of English education in 1853, according to Mr. RUSKIN, were the despising or ignoring of Natural History, Religion, and Politics; and he maintained that at least the first elements of those branches of knowledge should be taught to every schoolboy. But the things which he now considers should be imperatively taught are—(a) the laws of health, and the exercises enjoined by them; (b) habits of gentleness and justice; and (c) the calling by which the child is to live. The great leading error of modern times is, according to Mr. RUSKIN, the mistaking erudition for education, and he is no less positive about the limits which should be set to all knowledge. "I pray you very solemnly," he writes, "to put that idea of knowing all things in heaven and earth out of your heads. It is very little that we can know over all the ways of Providence or the laws of existence. But that little is enough, and exactly enough; to strive for more than that little is evil for us."

It would be impossible in four pages to give a notion of

\* John Ruskin: Aspects of his Thoughts and Teachings. By Edmund J. Baillie, Member of the Ruskin Society. London: John Pearce, Orpington: George Allen.

Mr. RUSKIN's principles in art, more especially as he has not been consistent in his utterances. The abstracts given by Mr. BAILLIE will puzzle rather than enlighten the student. Such a passage as the following must be incomprehensible if taken by itself:—"Everything that you can see in the world around you presents itself to your eyes only as an arrangement of patches of different colours variously shaded. The whole technical power of painting depends on our recovery of what may be called the innocence of the eye; that is to say, of a sort of childish perception of these flat stains of colour, merely as such, without consciousness of what they signify, as a blind man would see them if suddenly gifted with sight." It is remarkable that in the pamphlet there is nothing to suggest that Mr. RUSKIN, when writing of art, considered architecture as well as painting. In consequence, the pamphlet becomes suggestive of Mr. RUSKIN's later moods, for he has confessed that the architecture which he one time tried to introduce among us is "inconsistent alike with the reckless luxury, the deforming mechanism, and the squalid misery of modern cities."

MILTON gave the preference to his "Paradise Regained," and Mr. RUSKIN gives the first place in importance to his chapters on political economy, which bear the title of "Unto this Last." But few of his readers will accept this judgment, although no subject can be more important, and not one of Mr. RUSKIN's books is in a better style. It must, we believe, be said that this book did not secure the success that was customary with those bearing the author's name. This did not arise from any defects in the theory, for opinions, however irrational and impracticable, somehow are acceptable in political economy. But the speculation in "Unto this Last" did not coincide with what was affirmed to be the manner of Mr. RUSKIN. It displayed sympathy with living men, and especially with those who toil in order to make other men rich, while the public believed that Mr. RUSKIN could only treat of inanimate things, like paintings and statues, the old tower of Calais church or the hulk of the *Temeraire*, or of flowers, clouds, rocks, &c. If Mr. RUSKIN's other books had been studied with care, the book might have had a different reception; but, as we have said before, Mr. RUSKIN is not a popular author, and the class of people who would probably be his sincerest supporters are too poor to be able to pay guineas for his volumes.

### THE PROPOSED CHAMBER OF DEPUTIES, PARIS.

WHEN the sittings of the French Parliament were transferred from Versailles to Paris, in 1879, the members of the Chamber of Deputies, 537 in number, found themselves very badly accommodated at the Palais Bourbon, where they had to meet in a hall built under Charles X. for 430 deputies only; and when, shortly after, the number of representatives was increased by 20, the inconvenience was aggravated. During the session of 1881-82 a commission appointed to consider the matter reported that it was not possible to alter or improve the present Chamber in the degree required for the service of the deputies, the public, and the press. It was therefore decided to revert to the project prepared in 1879 by M. de Joly, architect to the Chamber, who had made a long preliminary study of the work, and travelled throughout Europe, visiting and examining the various parliament houses, in order to gain experience both from the successes and errors of his predecessors in the same line. He was accordingly invited, by a vote of the Chamber on March 2 last, to prepare complete and detailed plans for a new Chamber, &c., to be erected within the precincts of the Palais Bourbon. This project, which contains twelve sheets of drawings, an approximate estimate, explanatory notes, &c., is now ready, and on view to the public in one of the rooms of the palace.

The new building is to be erected in the present Cour d'Honneur of the Palais, facing the Grand Square. The main façade, consisting of a centre block and two wings set back, will be about on a line with the buildings that occupy the centre of the Grand Cour, and have before it a space 37½ mètres long by 54 mètres broad; while the columned peristyle fronting the square is to be removed, and replaced by iron railings. The height of the new buildings will not exceed 20 mètres, or 7 mètres less than the greatest height of the existing Palace buildings. The entrance for deputies, senators, and members of the press will continue to be on the quay side, but the public will, under the new arrangement have to go round by the Place du Palais Bourbon, thus creating a diversion the need of which has long been felt.

As regards the Chamber itself, M. de Joly has informed us that the ideal he set before him was a hall where the deputies, press,

public, officers and servitors of the legislature, could move about, be seated, see, hear, and breathe at their ease. The arrangements made to this end may be summarised as follows:—

*For Seeing and Hearing.*—The shape of the hall can best be described as the section of an egg; the contour being an elliptical curve, and the base also slightly curved instead of straight. In this way all the seats will be, in a sense, facing and at right angles to the tribune, so that deputies will not have to change their natural position in order to see the orator; the distance of the latter from the farthest of the seats directly facing him is 21 mètres, and from those on his extreme right or left only 11.50 mètres; finally, the tribune is at such an elevation that the speaker will dominate the highest row of seats, and the hall being entirely free from projecting decorations, there will be nothing to prevent the sound of his voice reaching all parts both of the floor and the galleries. The architect thus claims to have thoroughly provided for seeing and hearing the orator, and for observing the movements of the House.

*Circulation.*—The President will reach his chair by a private door in the base or axis of the hall, while the deputies will enter by eight doors opening on to an interior gallery, 10 feet wide, running round the interior of the Chamber. This gallery is on a level with the large reception-halls of the Palace, and 6 feet 6 inches above the floor of the House; so that, contrary to the arrangement that obtains in our House of Commons and the present Chamber of Deputies, members will have to descend instead of ascending to their places, and thus all the movement and disturbance necessarily caused by arrivals and departures will take place at the circumference instead of the centre. This gallery, moreover, terminates at each end in a flight of steps, enabling members to get to the *bureaux* (tables) of the House, which are on a line with the President's fauteuil, without passing right across the Chamber. The seating surface is divided into nine sections, the seven central ones of which are again cut into two by gangways opening into a passage running round the arc, half-way up the slope or tier of seats. Interior circulation is thus well cared for, while exteriorly the new Chamber will be connected with the Palace by a large rectangular hall, and with the buildings to right and left of the Grand Cour by two vestibules.

*Area and Seating.*—The area of the hall at the topmost range of deputies' seats is 791 square mètres, against 440 in the present Chamber, while, taken at the wall of the second gallery, which may be regarded as the true exterior of the building, it is 889 mètres. The height is 18 mètres, and the number of seats 689, the minimum space for each being .65 of a square mètre, instead of only .425 in the Palais Bourbon.

*Galleries and Tribunes.*—Around the main ellipse or curve of the hall are two large public galleries, one above the other, the first of which contains 550 places, arranged in four rows of seats, and the second 460 places, in three rows. Access is obtained to each of these by nineteen doors, opening at regular intervals on to spacious corridors; the three front rows in the first and the two front in the second are divided into stalls. M. de Joly calculates that, in addition to tickets for reserved seats, 166 places in the lower and 393 in the upper gallery will always be available for the public. On the right of the first gallery 165 places are reserved for the press, and other seats are specially allotted as follows:—Twelve for general officers, 22 for senators, 24 for ministers, 24 for the President of the Republic, 28 for the Diplomatic Corps, 24 for the President of the Chamber, 18 for the Council of State, 24 for the vice-presidents and secretaries, 24 for ex-deputies, 24 for the questors, and 166 for the public.

To right and left of the bureaux of the House are two special tribunes, holding 60 persons each, and reserved expressly for members of the Senate.

*Lighting.*—Daylight will be admitted by eleven large bay windows, measuring 3½ by 5 mètres, in the side walls; the total lighting surface thus afforded being 154 square mètres. Each of these windows will be doubly glazed, the outside panes being of ordinary white glass, and the interior of slightly tinted squares, set in lead, the effect of which will be to soften and mellow the light, while blinds are provided to keep out the direct glare of the sun when occasion requires. For artificial lighting the architect has adopted the luminous ceiling, and the glazed part occupying the centre will present a surface of no less than 150 square mètres, composed of grained glass, relieved with designs in red and gold, to imitate the Roman ceiling drapery. With this, of course, either the electric light or gas can be used.

Ventilation is provided for on the same system that has succeeded so well at the Opéra Comique in Paris—viz., by the introduction of fresh air through the floor of the Chamber, and escape of the foul and heated atmosphere through ventilators in the roof. The execution of the above plan will necessitate important alterations in the existing dependencies of the Palais, in order to place them in due connection with the new Chamber.

One of the greatest inconveniences of the present situation is the distance of the various services from the Chamber; in the plan under consideration this is entirely altered, and the new hall will be, so to speak, surrounded by its various offices and dependencies. By the Salle des Pas Perdus it will communicate with the lecture-hall, refreshment-rooms, library, &c., and by the

vestibules to right and left access will be gained to the *bureaux*, committee-rooms, offices of inquiry, shorthand-rooms, *secrétariat général*, President's rooms, the official report, pay department, post, telephone, and telegraph offices, lavatories, &c.

The lecture-hall will occupy the present Salle des Séances, the floor of which is to be levelled by the removal of the existing tiers of seats, &c. The refreshment department will be established in the Salle Pujol, the present buffet being turned into a smoking-room. The library remains in its present quarters, but several fresh galleries on the first floor will be added to it; the Salle Delacroix is to be set apart for the use of deputies, as a conversation and resting-room; the Salle Mirabeau and its side galleries will be continued to be used for the reception of visitors and friends of the members, and, as they are considered insufficient, another large hall, 33 mètres by 19 in dimension, will also be set apart for this purpose.

### PUBLIC SCHOOLS IN SCOTLAND.

IN his report on the schools inspected by him in the Ayrshire district Mr. J. W. Marshall, M.A., writes:—The organisation of the Government school in seven classes or years settles in great part the architecture of the school-house; but the number of children taught, the desks, passages, &c., have also to be considered. A certificated teacher is qualified to teach sixty (eighty) pupils, and we might infer that every schoolroom should be built to accommodate that number. A fully-organised school will have a room for every class according to the size of the class. This organisation is seen in Kilwinning, Stevenston, and Dalry West-end schools. To take up a section of a class there are small classrooms in which a pupil teacher or monitor can work. This kind of school is perhaps expensive where certificated teachers are employed, but with ex-pupil teachers it is sufficiently economical. However, it is suited only for schools with an annual average above 300. There are in this district several schools, particularly the Ardrossan schools, Cumnock, Maybole, &c., which are the largest in the district, and which do not seem to have been built on any very precise plan. Generally they allow of only three departments, and adopt the hall system with very insufficient classrooms. The hall is convenient for an exhibition or inspection day, but for teaching purposes it is unsuited. For example, we may have two or three rooms, each 56 feet by 22 feet, in which three or four teachers work together. There will generally be three grades; the natural order will be to group the 1st and 2nd Standards in one department, the 3rd and 4th Standards in the middle department, and the 5th and 6th Standards in the highest departments. Various combinations, however, are found. In Old Cumnock, for example, the senior master has the charge of the 1st, 2nd, and 6th Standards, which is rather a peculiar conjunction.

Nothing is gained by a schoolhouse of this kind. The schoolhouse is first built, and then the classes are made to fit into the building; whereas the schoolhouse should be constructed to suit what it has to hold. For schools like Ayr Newtonhead, Old Cumnock, Maybole, &c., the classroom system alone is suited. In Maybole School, where subdivision is practicable, there is still a plurality of classes worked together, and absolutely no classroom accommodation.

For schools with an average between 200 and 300 three departments are necessary. Unfortunately, even where we have three teachers, as in Muirkirk Ironwork School, we have not three proper rooms. What is the use of a hall 58 feet by 24 feet, if five classes have to be taught in it simultaneously? A room 40 feet by 24 feet would suit much better for a main room, and a second room, 35 feet by 21 feet, would allow the middle standards to be thoroughly trained. In Newton Academy, (Kilwinning) Eglinton Ironworks, Lugar, Catrine, and Irvine Loudon Street schools, the formation of a middle department would be a great improvement.

There is great variation in the proportions of the schoolhouse. In Catrine P. School the principal room is 68 feet by 19 feet; in Crosshill School it is 78 feet by 19 feet; in Dunlop School it is 72 feet by 20 feet; in Girvan Burgh it is 72 feet by 25 feet. Now, unless it be for preaching, what is the use of a room 72 feet by 25 feet? In it three or four pupil-teachers waste their lungs and their lives to no great purpose, while the certificated teachers work leisurely in the classrooms. What confusion and uproar would the working of 225 pupils produce, all in a single room! It may be convenient to have a room 50 feet to serve as a hall, but as a rule no room should be larger than 40 feet by 24 feet. Indeed a room 33 feet by 22 feet is the most suitable, for it forms a department, and without subdivision into departments thorough school work cannot be done. Discounting schoolrooms above 45 feet in length as unsuitable, and taking 35 feet to 40 feet as the proper length of the principal room, we find that the breadth should be  $\frac{9}{15}$ ths to  $\frac{10}{15}$ ths of the length. It is rare to find a room half as broad as it is long; but where we do find it, as in Ayr Lady Jane Hamilton's School, the advantages are apparent for purposes of grouping under collective teaching, and for drawing out classes under oral or slate examination. The Cumnock Roman Catholic School, which is one of the last built, measures 54 feet by 32 feet, but there is no

classroom accommodation, although there is already an average of 148. In the (Kilwinning) Eglinton Ironworks School we find two teachers and two pupil teachers working together in a room 41 feet by 30 feet. The Girvan Parish Schoolhouse is very inadequate, for the classroom is fit only for a cloakroom. In this school the head master, with two assistants and a pupil teacher, works seven classes in a single room without any subdivision. A school with an average above 60 (100) should have two departments; and a school with an average above 140 (200) should be graded in three departments.

Mr. R. Ogilvie, M.A., the inspector for the counties of Dumbarton, Stirling, and Clackmannan, writes:—The supply of accommodation may be said to have come tolerably complete from the hands of the first boards. It is to their vigorous and comprehensive efforts that Scotland now owes a network of school buildings; which, as I have stated before, are not only unequalled but not even approached in any other country in Europe. Most of the additions subsequently made have been necessitated either by the growth of the population or by the transference of voluntary schools. The new Hermitage Public Schools, Helensburgh, is a noteworthy exception. It is by far the most expensive as well as the most elegant structure in my district.

But if the first boards exceeded the most sanguine expectations in their generous and well-timed expenditure of public money, they fell into one or two radical mistakes, which their successors in office have learned, and are every day learning more and more to avoid. They were required to supply a certain amount of cubical space, and they simply instructed an architect to draw out and submit plans for its provision. Knowledge of school-keeping does not come even to architects by nature, and yet, speaking for the three counties which comprise my district, neither myself, nor any other professional educationist, so far as I am aware, was consulted in the construction of a single school. Instead of rashness, School Boards nowadays rather show an excess of caution, and rarely execute any important alterations on their own responsibility.

Many of the most glaring defects of the original buildings have been recently remedied. Miniature classrooms have been enlarged and big unwieldy principal-rooms subdivided. Dundas School, Grangemouth, is an excellent case in point. Huge rooms, in which two or three teachers shout each other down, have been too long the order of the day, from a prevalent popular notion of some latent virtue inherent in the headmaster's eye. Classrooms even have been brought under its awe-inspiring and order-compelling range by means of glass peepholes and all sorts of contrivances. But if schools can be disciplined, they cannot be taught by eagle glances. The matter of fact at least is that the best headmasters, though making their influence educationally felt in every corner of the school, have in almost every possible case betaken themselves to the smaller rooms. If assistants, who have now to a large extent supplanted pupil teachers, cannot maintain order and manage a given standard or other section, they are simply disqualified for their post. If two or three of them have to work in the same apartment, teaching is deprived as much of its luxury as of its effect.

### THE RELATIONS BETWEEN WESTERN AND EASTERN ARCHÆOLOGY.

A MEETING of the American Association for the Advancement of Science was held lately in Montreal. A paper on "Some hitherto unnoticed Affinities between Ancient Customs in America and the other Continents," by Dr. Phené, F.S.A., was read in the Section of Anthropology on August 28.

The author explained that as one of the great problems to be worked out, or which at least it is desired should be worked out, by all who have given any attention to the subject, is that of the races and civilisations which once flourished at the southern end of the northern continent of America, and which had evident connections with the more northern parts of what are now the United States, through those great ducts, the Mississippi and other vast river valleys, tending to the latter direction. He had devoted many years to the investigation of the subject. He had read papers upon certain particulars of this subject in the capitals of those countries in which he had found corresponding remains, so far as those particulars applied respectively to such countries. Great difficulty, he said, existed through absence of literary records, possibly lost in the destruction of such evidence by the conquerors of Mexico, the only city and country in which civilisation with rude but graphic literature and illustration existed on the face of this vast continent. And the difficulty was increased from the fact that, rude as it was, civilisation had then reached a point at which literature became essential, and though now to a great extent lost, had then actually taken root.

The customs which are shown to have existed in the great river valleys of America, though read with difficulty by the light of the strange monuments still existing there, seemed to the author to have had parallel existences on the other continents. In evidence of this he gave illustrations, by drawings and diagrams, of many earthworks and stone constructions which had been examined by

him in company with a large number of scientific men, and which agreed in the method of executing the earthworks, of arranging the plans and designs, and in the evidently similar purposes for which they were designed, and to which they had been devoted.

The points on which he rested his argument for the affinity of the American mounds and earthworks, and necessarily the customs with which they were connected, with those of Great Britain and a large number of similar works in France, Spain, Greece, Asia Minor, Persia, and China, were in the first instance the existence of relationship to each other, always in the vicinity of rivers, of mounds representing animal forms, and—with some special exceptions—the close proximity of vast works or camps for defence, huge enclosures or oppida for civil occupation, and other evidently sacred enclosures for solemn rites, worship, and sepulture. In America these evidences went no further, but in the vicinity of the mounds he had traced in Western and Eastern Europe, and in Asia Minor, and still further east, not only were all these features attendant, but the localities also abounded with mythological and traditional legends, and the retention of strange and weird ceremonies, to the present day.

He selected as illustrations of the American mounds those in the forms of serpents, the alligator (or mythical dragon), and the human form. The serpent was shown by the late Mr. Squire to have been executed in two ways—viz., by the solid continuous serpentine form, and by a series of symmetrical mounds uniformly placed in curves. The reader gave examples of each of these on diagrams, and explained that they existed in large numbers in Great Britain, similar in proportions and construction to those of the American mounds, which were kindred in form; and accompanying these were, he stated, in every case, extensive areas occupied by similar camps and enclosures for civil occupation, or oppida, and also separate enclosures for worship and sepulture. The characteristic physical, natural, and art features were also curiously persistent in each case, a triple imagery having been in very many instances studiously represented, both by places of selection, as the vicinity of triple-peaked mountains, and in construction, by triangular chambers and triangular enclosures in or about the head of the animal forms, as well in the American as in other similar mounds. Since his arrival at Montreal he had heard of indications of this having been an Indian burying-ground. They appeared often to have selected places of previous occupation, as in the mounds; and the triple hill and triangular piece of land at its base were significant. The works in Great Britain, Spain, France, &c., were found to contain chambers filled with cremative matter, and had studied arrangements for preserving the outlines of the animal forms, as shown in the diagrams, and were generally surrounded with vast lithic arrangements, and each, as a rule, was in the centre of an extensive necropolis of the primitive inhabitants. The legends and traditions clustering about these places were always of the same class in the other continents, and almost always had reference to man as the possessor and the serpent or dragon as the persecutor or destroyer, and this whether the tradition was one of uncultured and primitive existence, or of the highest classical-art ages and localities; and though such traditions did not exist in America, yet not only did their huge mounds simulate these forms, but there had been dug up from their mounds rude sculptured figures of the human form, and also of entwined or coiled serpents, showing that in their construction the same ideas, if not similar legends and traditions, had existed, as those which originated the *giganto machia* of Pergamos.

Amongst other numerous and striking examples of these forms in Great Britain, corresponding with the animal and human forms in America, were some very remarkable and yet but little-known representations of the human form belonging to a rude and unlettered age, perhaps corresponding to that of the semi-barbarous age of Mexico, which are found on the coasts of Devonshire and South Wales sculptured in stone, a very remarkable example of which also existed near West Hoathly, in Sussex, which was traditionally stated to have been worshipped as a potent deity (the Goddess Andras) by the early Keltic inhabitants. In the vicinity of these rude figures in the western and eastern extremities of the South of England, were two enormous *intaglio* representations of the human form, corresponding to the *intaglio* forms at Milwaukee, in Wisconsin, only one of which had been mentioned, and that in a very cursory manner, by writers on the comparison of these works with those of America; while their surroundings had been completely overlooked. The one not referred to was by far the more important, both in size and similarity, being in the exact attitude of the mounds in the human form of the American mound builders. About midway between these two figures was an equally enormous and well-known representation by *intaglio* of a horse. These figures were all cut in the chalk hills, and might be said to be protecting deities of the three localities in England most abounding in remarkable and vast areas of camps, oppida or settlements, and places of worship. The whole district from Dorsetshire to Land's End being commanded by the gigantic form in Dorsetshire; that of the miles of stone avenues on both sides of the Medway in Kent, terminated by Kit's Coty House at one end, several *allets couverts* at the other, with the huge stone figure at West Hoathly and the wood of Anderida to the south, were commanded by the similar gigantic *intaglio*

figure in Sussex; and the central and more important districts of Stonehenge, with the primitive and stupendous temple of Avebury. Its sinuous avenues of stone, and extensive earth embankments, the great tumulus of Silbury Hill, the avenues of stones near Amesbury, in the style of those at Carnac in Brittany, the large number of camps, the trilithon called the "Devil's Den," and the great dolmen known as "Weyland Smith's Cave," appear under the protection of the "White Horse." Metallurgy, a great feature with the mound-builders of the Mississippi, was also the peculiar occupation of one, if not of two, of these three districts of southern England and of many of the other localities in which similar works were found in Europe and Asia. And such metallurgy was for all utilitarian purposes confined in every such country in which these works exist to the two metals tin and copper, and analysis showed the proportions in the amalgamation of those metals to have approximated in America, Europe, and Asia. The parallelism went further, and was continuous in its track eastward. Brittany, Spain and France on each side of the Pyrenees, and so on to Asia Minor, had the same combined features. In the valley of the Meander, in Lydia, the vast figure of "Niobe," mentioned by Homer, still existed, sculptured on the side of a mountain, and, as well as that of "Sesostris" in an adjacent valley, also so sculptured, overlooked the district in which are the multitudinous tumuli near the Gygean Lake; and the fortifications and camps of the acropolis of Sardis corresponded with those already referred to in position and design; and the same features were found at Ephesus, Smyrna, and Pergamos in a striking degree, and extended, as shown by careful drawings and diagrams, onwards eastward as far as China. Considering the skill and thought required to plan such enormous figures with any regard to proportion, and seeing that all the figures had similar accompaniments, the author concluded by observing that they seemed to him to have been the result of a practice and culture transmitted with concurrent customs by way of the Pacific from one continent to another.

#### THE WALLACE AND BRUCE MEMORIAL.

THE members of the Treasurer's Sub-Committee on Properties, of the Edinburgh Town Council, met on the 8th inst., for the purpose of inspecting the competitive designs for the memorial to Wallace and Bruce proposed to be erected with a sum of money bequeathed to the Corporation by the late Captain Hugh Reid for the purpose. Captain Reid's will provided that 1,000*l.* should be placed at interest, which interest was to be paid to the testator's widow during her lifetime, after which the principal and interest should accumulate as a fund for twenty-five years to assist in erecting some memorial to the two national heroes. The will further suggested that the monument should take the shape of "an ornamental piece of water in the North Loch, with a fountain in the centre, and colossal statues in bronze of each hero in conference." The stipulated twenty-five years after Mrs. Reid's death having elapsed, the Corporation intimated that they desired to receive, in open competition, designs of the figures for the memorial, and among the conditions imposed on competitors were the following:—That the sum to be allowed for the completed work shall be 2,000*l.*; that the competitors whose designs are second and third in order of merit shall receive, out of the city's common good, premiums of 30*l.* and 15*l.* respectively, but in the event of no design being accepted no premium will be awarded; that the figures of the memorial shall be colossal, not less than 12 feet in height, and that those in the competitive models shall be of the uniform height of 3 feet; and that, while following generally the indications given by Captain Hugh Reid as to the site and character of the memorial, the treatment of the designs in detail, as well as the suggestion of the most suitable site within the locality indicated by the terms of the bequest, shall be left to the discretion of the competitors. Seven sets of figures have been put forward for competition, and, while varying considerably in style and in merit, the majority are creditable pieces of sculpture. In most cases the warriors are represented as clad in mail and armed, the Knight of Elderslie with his famous double-handed sword, and his compatriot with the short battle-axe wielded with such deadly effect against the English knight at Bannockburn. Meanwhile the names of the respective artists have not been disclosed, the models being merely distinguished by numbers and mottoes. After the committee had inspected the designs it was decided to adjourn the meeting without coming to a decision, and to invite the members of the Council to make an inspection and express an opinion regarding the merit of the several designs.

**York.**—Works of renovation and decoration, ventilation, &c., have just been completed at Monk Bar chapel. The work has been carried out under the direction of Mr. W. Browne, architect, Micklegate, York. Messrs. G. Simpson & Sons, of Heworth, have done the carpenter and joiners' work; Mr. Slater the plumber and glaziers' work; Messrs. Dearlove & Dodd supplied the heating apparatus; and Mr. J. Bakes, of Micklegate, executed the painting and decorating.

## NOTES AND COMMENTS.

AN amusing and novel kind of exhibition, organised by M. JULES LÉVY at his residence, 4 Rue Antoine-Dubois, will be thrown open to the invited on Sunday, October 1, for only four hours, viz., from 1 to 5 P.M. In this exhibition of incoherent art (*des arts incohérents*) will figure no less than 500 works executed on every conceivable sort of material: paper, wood, clothes, hats, domestic utensils, &c., for the most part by well-known members of the artistic, theatrical, and journalistic world. A few of these incongruous exhibits may be cited:—LUIGI LOIR, among other works, shows a bust with real hair and teeth; FRANÇOIS COPPÉE, a portrait of M. BARTAY D'AUREVILLY, taken with the pen in the space of one minute; LANGLAIS, a portrait of M. VEUILLON, on a kitchen skimmer; M. RAYMOND, a painting on a patent-leather shoe, &c. The demand for tickets among the *haute gomme* of Parisian society has been enormous, and what is called *tout Paris*, consisting, be it said, of 1,500 to 2,000 persons at the outside, will flock to M. LÉVY's rooms in the hope of seeing something new of its kind.

The old Polytechnic Institute is likely to become what it was proposed to be originally—namely, a place for instruction in applied science. It is the property of the Young Men's Christian Institute, and a system of technical education has been arranged which is so comprehensive as to rival that of the City Guilds. The fees to be paid are merely nominal. Thus, for example, in the evening classes for turning, lathe-work, and pattern-making, the fees for a session of seven months are four shillings to members of the Institute and eight shillings to non-members. The students will have the advantages of a large workshop, which will be fitted with lathes of an approved pattern. When the numerous applications of turning are considered, it will be surprising if the class does not at once attract a large number of artisans and amateurs.

A COMPETITION has been opened for the execution of a statue of RAPHAEL to be erected at Urbino, in Italy. In addition to the cast the competing artists must send in a paper explaining the idea they seek to express, and giving a detailed description of their work; they may also accompany the exhibit by a set of drawings illustrating the various aspects of the statue. The casts, &c., must be sent in at latest by February 28, 1883, and will be exhibited to the public on March 28 following, the anniversary of the birth of the painter. The result of the competition will be declared two months after the close of the exhibition.

EDINBURGH has hitherto not been credited with giving much attention to sanitary affairs; but any shortcomings in them are likely to be soon remedied. The first Sanitary Assurance Association was established in Edinburgh, and it has been, we believe, very successful. The Corporation has now undertaken the work for which societies of the kind were established. According to a report of the Public Health Committee, any citizen who has a suspicion that his drains or the sanitary arrangements of his house are not right, has only to send notice to the Burgh Engineer, who will immediately send a competent inspector to examine the whole sanitary arrangements of the house. This applies to rich and poor. The Burgh Engineer prepares a report containing a statement not only of the deficiencies, but also of the proper way to remedy them. This is a new departure in municipal government, and the results of it will be watched with interest throughout the country.

It is announced that, with the opening of the season, several of the principal Paris theatres are organising exhibitions of painting and sculpture on the staircases, in the corridors, refreshment rooms, &c., of their houses. The object of these exhibitions is to facilitate the sale of works, and the results obtained during former years have been satisfactory. In some of the theatres the works of art will be open to inspection by the public not only during the representations, but also for a part of the day. The first of these exhibitions was opened last week at the Théâtre des Nations, and among the exhibitors are several artists whose works have been hung at the Salon, and are well known to the public. The movement may be regarded as a sort of strike against the exorbitant commissions of the Paris picture-dealers.

THE lottery on behalf of the Art Orphanage is to terminate in a lawsuit, owing to a dispute over the chief prize—a picture by M. MEISSONNIER entitled *Le Reître Allemand*. For some considerable time after the drawing no one came forward to claim it, but about a fortnight ago the winning number was produced by a M. LEQUOY. This ticket, however, was in a lamentable state of dilapidation, being torn, dirty, and part of it missing, although the number and signature of Madame MARIE LAURENT, the president of the Orphanage, were intact. But owing to the condition of the document the Lottery Committee refused to hand over the valuable prize to the owner, and M. LEQUOY will be compelled to make good his claim before a court of law. In the meantime, on the demand of this gentleman, M. GEORGES PETIT, the well-known picture valuer, has been appointed *séquestre* or guardian of the disputed property.

THE twenty-sixth meeting of the Social Science Association will commence at Nottingham on Wednesday next. An inaugural address will be delivered by Mr. G. W. HASTINGS, M.P., to whom the foundation of the Association may be ascribed. Among the questions set down for discussion are the following:—“How can technical training be best associated with (a) primary schools, (b) intermediate schools, and (c) local colleges?” “In what way and to what extent is the endowment of research practicable and desirable?” “In what way can the influence of art be best brought to bear on the masses of the population in large towns?” “What are the proper limits of conservatism in regard to ancient buildings?” Mr. G. AITCHISON, A.R.A., presides over the Art Department, and his address cannot fail to be interesting. Most of the principal local manufacturers have agreed to allow the members to inspect their works.

ACCORDING to Mr. MILNE, of the Engineering College of Japan, the proposed Panama Canal is likely to be disturbed by earthquakes. In Japan those disturbances are not uncommon, and, according to Mr. MILNE, the houses which are unroofed are those with steep roofs. He infers that embankments must suffer in like manner, and that those which are intended to withstand the effects of an earthquake must have slopes given to them which will enable them to resist displacements caused by horizontal forces, and not simply be constructed by the usual rules and formulæ, where gravity, acting in a vertical direction against frictional and other resistances, is all that has to be considered. In the construction of the gigantic dam which is necessary to protect the Canal from the torrents of the River Chagres, similar principles will have to be considered. This also will be the case with all bridges, buildings, piers, embankments, and other constructions essential or accessory to the making of the canal. Other principles of construction especially adapted to earthquake-shaken countries will also require serious attention.

THE decision in the Earl of DUDLEY's action against the authorities of Dudley has emboldened the directors of the Orrell Coal Company to claim 22,664*l.* 12*s.* 7*d.* from the Wigan Corporation for loss and damage arising through the construction of a sewer. The Wigan sewage is carried to a farm by a conduit seven miles in length, which passes over the coal-beds of the company. It is maintained that in consequence of the construction and maintenance of this outfall sewer, the mines cannot be worked in accordance with the usual and customary method of working without causing the subsidence of the surface and injury to sewer-pipes and works; that it will be necessary to leave unworked a large quantity of the mines, not only under the sewer, but under the land adjacent thereto; and that the company will be hampered and hindered in working the other portions of the mines, making the cost much greater. The Corporation disclaim the right of support, maintaining that the Coal Company may work their mines without any injury to the sewer, which has been so constructed that it will not be damaged by any subsidence; that no support, either vertical or lateral, is required from the plaintiff company; and that they are not liable, and will not pay the amount claimed. The case is now being heard at Lancaster before Mr. HIGGIN, Q.C., and it is understood that if the Orrell Company should be successful, many similar claims against the Wigan Corporation will be raised. This is a new impediment to sewage utilisation.

DESIGN FOR THE NEWPORT TOWN HALL.  
VIEW FROM NEW ST  
WM. M. HODGES, ARCHT.

## ILLUSTRATIONS.

REREDOS FOR PARISH CHURCH, GRANTHAM.

THIS illustration has been reproduced by the ink-photo process from the drawing exhibited by Mr. A. W. BLOMFIELD, M.A., at the Royal Academy this year.

DESIGN FOR PUBLIC LIBRARY, OLDHAM.

THIS design was submitted in the recent competition by Mr. R. KNILL FREEMAN, F.R.I.B.A., of Bolton.

DESIGN FOR NEWPORT TOWN HALL.

WE publish in this impression two views submitted, under motto "Calenig," for the Newport (Mon.) Town Hall competition. The architect, Mr. WM. M. HODGES, claims to have strictly carried out the instructions issued to competitors. The chief difficulty was in the site, as shown on the plan, and the existence of a right of way through the building. These have been skilfully treated. The police-court is placed on the lower ground-floor, having an entrance from the new street; and adjoining, but with an entrance from Merchant Street, are the police-station, cells, &c. The fire-engine station, with stabling, is in Austin Friars, where also are the School Board offices. On the ground-floor proper are the public offices, the Town Clerk's office being located on the right of the principal entrance. The first-floor front is entirely occupied by the assembly-room, approached by a handsome staircase, and at the back are the Council chamber, committee-rooms, &c. These have a separate staircase. The material intended to be used is Bath stone for the principal front, and rough rag, with Bath dressings, for the other elevations. The estimated cost is 8,300*l*.

TOWER OF ST. GILES, EDINBURGH.

THE subject of illustration is supposed to have been erected about the middle of the fifteenth century, at which period extensive alterations were made on the cathedral. Generally spoken of as a lantern or crown, it is one of a very few remaining examples, and is perhaps the best of such. As will be seen from the drawing, it consists of eight buttresses, from which spring a similar number of vaulted ribs, supporting a lofty spirelet in centre. The buttresses have originally been pierced at level of main parapet, to allow of a free passage all round, possibly for the purpose of sentinel duty, as in troublous times the tower has been occasionally put to military uses, particularly so in 1571, when KIRKCALDY of Grange fortified the tower with cannon, to enable him to hold the town against the Regent MURRAY. The ascent from main parapet is by a steep, wheeling stair, which forms part of centre buttress on east side, and thence over the vaulted rib to upper gallery, from which the whole city can be viewed. In 1648 the structure was found to be in so ruinous a condition that a complete overhaul and repair were considered necessary. At this time the main pinnacle or spirelet would seem to have been rebuilt, as also the greater portion of crocketed pinnacles and cusped cresting on back of vaulted ribs, the openings in buttress being filled up with masonry. These repairs arrested the progress of decay for two centuries, when it was decided to tie all the main supports together to prevent bulging; this was done by iron tie-rods, going crossways from buttress to buttress, at level of springing of vault. During its various repairs the lantern has lost its Gothic character considerably, more especially in the spirelet before mentioned, which, if detached from the lower portion, would be difficult of architectural classification. Standing at a considerable elevation from street, its defects in detail in no way detract from the picturesque effect of the tower of a building, rich in historic memories. The cathedral itself, which for long was partitioned off into three distinct churches with galleries, is now in course of being cleared out and beautified by the munificence of Dr. CHAMBERS, the well-known publisher.

**Northowram.**—The corner-stone has been laid of a New Connexion Methodist chapel. The building is designed by Mr. R. F. Rogerson, of Brighouse, and will be plain in style, and comprise both chapel and school. The latter is under the chapel. There will be in all four classrooms, two at each end. The contractors were: Masonry, William Hanson, Shelf; joinery, J. Charnock & Sons, Halifax; plumbing, J. Holdsworth, Halifax; painting and plastering, Hinchliffe & Hainsworth, Northowram; slating, Jas. Smithies, Bradford.

## "IL GRECO."

MR. J. C. ROBINSON sends the following account of Domenico Theotocopulo, called "Il Greco," to the *Times*. It is *apropos* of the painting ascribed to the Spanish artist which was purchased from the Hamilton collection for the National Gallery.

This extraordinary painter was, in reality, a genius of the most irregular and capricious order, sometimes attaining to the highest excellence in certain directions, his works entrancing both eye and mind with the most exquisite and subtle harmonies, at times a very Beethoven or Mozart in painting, but more frequently a wild rhapsodist, in whose tempestuous imaginations there are yet, as it were, sweet and lively strains faintly heard amid a loud clangour of incoherent sounds.

From the first there was probably a strain of madness inherent in Il Greco's nature, which, judging from his later and more abundant works, would seem to have occasionally developed itself into absolute lunacy. The man was a problem and a *crux* to his own people; then, as now, it is evident that mere eccentricity had a certain attractive charm, for his pictures, even the oddest and most incomprehensible, were always received with a certain wondering respect and deference by his contemporaries. At all events Il Greco held a high position in his own time; and although judging from his productions one might have expected quite the contrary, his life and conduct were orderly and his bearing cultivated and intelligent. It is not only at the present day that his pictures have been compared with those of Titian, for Philip II., who was a cultivated judge of art and of all men best acquainted with the masterpieces of the great Venetian, who was his own court painter and whose glorious works were sent to him year after year fresh from the easel, said of Il Greco that, while sometimes he soared up to the level of Titian, he more frequently fell beneath that of his own reasonable performances. All that is known for certain of Il Greco is afforded by the scanty notices of Palomino and Cean Bermudez and the internal evidence of his own works. That he was a native of Greece is shown by the signature on his pictures, in which he so styles himself; these signatures, moreover, are written in Greek characters. He was working in Spain at least as early as 1577, and he died at Toledo, at an advanced age, in 1625. As to the sources from which he derived his style and knowledge of art, the evidence of his pictures is patent. Unquestionably he was a scholar and follower of Tintoretto and the Bassanos, and acquainted with the works of Paul Veronese, and that he had made a long sojourn at Venice before coming to Spain may be inferred from many indications.

But although the evidences of his early training are obvious enough, it must not be inferred that Il Greco was a copyist, or mere appropriator of other men's ideas and mannerisms; perhaps, on the contrary, a more distinct and original personality is not to be found in the rolls of art.

I may state what I believe has not hitherto found public utterance, that he was the real precursor and inspiring source of a genius infinitely greater than his own—Velasquez—for unquestionably Velasquez in his mature, perfected practice was strongly influenced by the works of Il Greco. Quite as certain as it is that Ribera was the model for the early works of Velasquez, so to those who are familiar with the abundant productions of the half-mad Greek is it that at a more advanced period they took firm hold on the fancy of the great Spaniard, and were utilised by him in the same manner as the works of Tintoretto and the Bassanos had previously been by Il Greco himself.

It is an unsatisfactory and more or less fruitless task to endeavour to describe by words only the characteristics of any great painter. Moreover, the actual inspection of isolated and subordinate works, taken note of in ignorance of the great bulk of his productions, is calculated to convey inadequate or even totally erroneous impressions of the general *status* of the master. Who, for instance, acquainted only with Velasquez's pictures of *The Nativity* or *The Boar Hunt* in our own National Gallery could form a true estimate of the style and æsthetic value of the master as developed in *Las Meniñas* or *Las Lanzas*? The little picture just acquired by the National Gallery, nevertheless, stands in much the same relation to the great works of Il Greco still *in situ* in his adopted country, and unless it is ultimately supplemented by other and more important specimens it will be but a feeble and misleading light, without any adequate *raison-d'être*.

Il Greco was, above all, a great and most original colourist. His palette may be imagined set with the iris tints from angels' wings, whose heavenly voices inspired a St. Cecilia. He had that inspiration or intuitive appreciation of colour which I cannot but think is in some occult way or other identical with the ineffable afflatus—call it melody, or harmony, or what not—which is the soul of music. Furthermore, in his fine works, Il Greco is seen as a most brilliant and graceful executant; while even his wildest productions are dashed on the canvas with a *furor* of manipulation, the novelty and strange originality of which alone arrest attention. It has been already stated that Il Greco found his types of humanity among the Spanish peasantry of his day; this is almost exclusively the case—Christ, the Virgin, the Supreme Being even, the angels and saints, whole armies of whom were depicted by his fertile pencil, are all alike common, usually ugly, sunburnt, horny-

handed creatures, full of variety it is true, for it is evident that Il Greco had a keen appreciation of salient characteristics of physiognomic types and points of individual difference. In this respect, indeed, he was superior to the Bassanos, his precursors and models in this homely style; but Il Greco's impersonations are never either vulgar or grotesque; he has, on the contrary, admirably caught and perpetuated the innate dignity of look and bearing of the old Spanish people, the pride of race stamped indelibly on every face. If, indeed, his labours had been mainly directed to portraiture, instead of to church work in general, it would have been a notable gain to art, for the few portraits by Il Greco which remain to us are very excellent; here, indeed, he may be most favourably compared with Titian. His grave and stately hidalgos, in their simple black dresses or glittering armour, have all the truthfulness and intensity of expression of that great master's impersonations. Moreover, in his portraits Il Greco seems to have emancipated himself entirely from the eccentricities and mannerisms so often seen in his subject pictures. Unfortunately his portraits are very rarely met with. I have never seen an example out of Spain, and there only in Madrid, in one or two private houses which still retain ancestral pictures. Such as I have noted, moreover, are all male portraits; I cannot recollect ever to have seen a certainly authentic portrait of a lady by this master.

It is impossible adequately to describe Il Greco's peculiar style of execution. It was, in fact, most variable. In his earlier and best works the manipulation is often in the highest degree dexterous and spirited, yet simple and unobtrusive. His touch is often as light and suggestive as that of Velasquez, and it is always rapid, clear, and brilliant; but in his "mad" pictures these qualities are seen in weird exaggeration; his handling is of the strangest fashion—long glittering streaks of pure colour, like knife-blades, are laid side by side or interlaced in the wildest confusion. A French writer, some years ago, happily characterised this sort of work as like "the clashing of sword-play." The whole, in fact, is weird, ghostly, and tempestuous. In one of these "mad" pictures in my own possession, which by a stretch of the imagination is supposed to represent the Salutation of the Virgin, the Holy Spirit, as a dove, is seen descending in a kind of Niagara cataract of fire, enveloping with flame-like tongues the awe-stricken Virgin, whose long, contorted figure is clad in angular drapery more like the faceted surface of scorched and lightning-stricken rock than any textile stuff. The Angel, moreover, rushes forward, brandishing his lily-branch, as if impelled by a mighty wind. The whole conveys the idea of some inexplicable convulsion of nature; but even in this extreme instance redeeming passages of original and beautiful colour may be discerned, like veins of rich metal running through the scoria of a volcano. Twenty or thirty years ago, this class of Il Greco's pictures abounded in Spain and were to be found in the shops of curiosity dealers or furniture brokers throughout the land. In my peregrinations I have, in fact, frequently left behind great canvases of the master, offered to me for a few dollars each, simply from the trouble and difficulty of transporting them. Of late years, however, such pictures have become much less common, and there are symptoms among the artists and aesthetes of Madrid that an era of Greco-worship may possibly set in. It will be inferred, nevertheless, from what I have said, that the really excellent works of Il Greco, the sane and solid pictures, as opposed to the maniacal extravaganzas alluded to, were never bandied about in this careless manner. The most precious and beautiful of his works are the small finished pictures, but of these he seems to have produced comparatively few specimens. They are always, so far as I am aware, religious compositions; I have, in fact, never seen any purely secular subject by the master other than portraits. These small finished pictures are now very rare. A charming specimen came under my notice a few years ago in Madrid. The subject of this was *The Adoration of the Shepherds*, a crowded composition of small figures, painted with exquisite grace and facility, and sparkling with brilliant jewel-like colour. This picture made its appearance in the hands of a famous curiosity dealer of the female sex, rejoicing in the appellation *La Jesusa*, whose fashionable establishment, which suddenly collapsed, was a nine days' wonder. The picture was deposited for sale with this personage, but, I think, very soon withdrawn by the owner. I daresay its whereabouts might be still ascertained in Madrid.

Il Greco's great works *in situ* are mainly at Toledo, and one of them alone, were there no other attractions in the grim old Gothic city, would be worth a pilgrimage. This is the famous *Burial of the Conde de Orgaz*, in the old church of Santo Tomé. Although but half visible in the dark chapel where it has hung untouched for three centuries or more, this picture can scarcely fail to strike every observer, the artist more strongly than the layman, as one of the great pictures of the world. It is a less vast and doubtless a less-renowned production than Velasquez's great masterpiece *Las Lanzas*, but to me, and I have been to see the picture repeatedly at many years' intervals, it has never failed to suggest direct comparison with that famous composition. I have, indeed, no doubt that it was a direct inspiring source of *Las Lanzas*. The pictures, moreover, have this in common—they are both crowded compositions of life-sized figures, all actual portraits, mainly of high-born

Spanish gentlemen clad in the splendid costume of their own day; for although the Conde de Orgaz was one of those semi-saintly personages who flourished ages before in the land, Il Greco has represented his interment as attended by a brilliant band of high-born hidalgos, priests, and acolytes in their splendid vestments of the second half of the 16th century.

The dead count, whose noble head droops over his cuirass as they lower him into his grave, clad in his full suit of splendid russet and gold armour, gleaming and flashing in the light of an evening sun, forms the central motive of a gorgeous turmoil of crowding eager-visaged figures; mail-clad knights and priests in rich embroidered copes and dalmatics; it is, in short, a glorious vision of rich and sparkling colour, impressed upon the canvas with infinite spirit and grace of style. In this work there is no eccentricity, no conscious mannerism, but in all parts most subtle renderings of nature, effected with that certainty of hand and seeming ease which is vouchsafed only at rare intervals to the most gifted. The general style and technique of the work are, in fact, eminently modern; the entrancing qualities of Rubens, Reynolds, and Gainsborough, as well as of Velasquez, may, indeed, almost be imagined as foreshadowed in this admirable picture. So far as I am aware, Il Greco is not represented in any of the European public galleries, except at Madrid, so that to artists and the public at large, who have not visited Spain, he is necessarily but a *nominis umbra*.

### THE DELABOLE SLATE QUARRIES.

ON Tuesday last the members of the Royal Institution, Cornwall, visited the Slate Quarries at Delabole, when the following paper was read by Mr. C. Bainbridge Rendle, one of the directors of the company:—The old Delabole Slate Quarries, which have this day been visited by you, the members of the two learned societies, the Royal Institution of Cornwall and the Royal Cornwall Polytechnic Society, have an especial claim to interest the antiquary as being probably among the oldest slate quarries in Great Britain still in active operation; for while it is said that the quarries of Lord Penrhyn, in North Wales, were first worked in the time of Queen Elizabeth, there are many old mural tablets in the neighbouring churchyards of honest Delabole slate dating back to an earlier period in the sixteenth century; and Carew, writing in the year 1602 of the Delabole roofing slate, describes it thus:—"In substance thinn, in colour faire, waight light, in lasting strong, and generally carrieth so good regard, as (beside the supply for home provision) great store is yearly conveyed by shipping both to other parts of this realm and also beyond the seas into Brittannie and Netherland." Borlase, writing in 1758 of the slate from these quarries, says that for its lightness and enduring of weather it is generally preferred to any slates in Great Britain, and describes the great quarry as in his time 300 yards long and 100 yards wide and 80 yards deep, observing "that all the slate is carried with no small danger on men's backs, which are guarded from the weight by a leather cushion." This system of working was still in vogue in the early part of this century, until the improved haulage of a one-horse whim and windlass superseded this primitive mode, and this again gave place to steam power, which was introduced about forty-five years since.

In those days these quarries belonged to several owners, who worked their beds of slate rock as deeply as they were able, and as they worked out one part, filled it in with rubble, or heaped it up around the headlands of their quarry as an ill-fated legacy to their successors, and the present company have had for many years this incubus of dead work to contend with, some evidence of which is still to be seen at the far end of the quarries.

Until the last few years the mode of working was to erect papet heads, or projecting wooden frames on the cliff of the rock, supporting huge wooden cranes, and by means of iron chains passing over these, steam power hoisted up the slate rock and rubble from the pit below. Two papet heads of an improved character worked with steel ropes instead of cumbrous iron chains are still used, but the future developing of the quarries is to be seen at the far end on the western side, where one steam engine hauls up an inclined plane in trucks the slate rock and rubble produced from four terraces or galleries. Of these the two upper galleries are taking off the tops or overburthen covering the slate bed, and also the deposited rubble left us by our predecessors, and will be met by corresponding galleries now being worked on the eastern side, thus surrounding the quarries, while the two lower galleries are commencing to work the permanent slate bed. When this system of galleries is fully developed to the bottom of the quarries the slate production will be largely increased, as we are at present only producing slate from the top and bottom of our slate bed, and the gallery system will ensure greater safety to our men, and less risk of serious slides or landslips.

The quarries and rubble heaps cover some twenty-five acres of land, the length of the quarry being on its western side about 1,300 feet, and the depth about 400 feet. At present about 420 hands are employed. In the past three years more than one million tons of slate rock and rubble have been taken out of the

pit. The indications of the slate bed at the far end lead the company to expect that these quarries are still in their infancy, as a most productive vein is found underlying the quarries at their greatest depth.

*Query.*—Is the name De la Bole of Norman-French extraction, or is the local nomenclature Dinabole the more correct one? As bearing on the latter a neighbouring farm is called Dinabroud.

### ENGLISH SCHOOLS.

THE following remarks on the condition of the schools visited by the inspectors in 1881-82 are taken from the reports presented to the Committee of Council on Education:—

#### *Bromsgrove District.—Mr. Barrington-Ward, Inspector.*

King's Norton is a very extensive parish lying to the south of Birmingham. A considerable portion of the suburbs of that great town are included in the parish. The population is at present about 35,000. It grows apace in the urban parts, the increase of inhabitants between the years 1871 and 1881 being no less than 12,333—over 62 per cent. A rapidly growing neighbourhood like this necessarily needs continual additions to its school supply, and the School Board has made such additions with no sparing hand. The cost of erecting the King's Norton Board schools is unusually, and I must say unnecessarily, high. The average cost of the buildings already provided (including sites) has been no less than 13*l.* 2*s.* 2½*d.* per child. The Harborne Board, on the contrary, was able to supply three new schools at the average cost of 8*l.* 17*s.* 7*d.* for each place provided. This is a discrepancy which tells plainly of reasonable economy in one place, the opposite in another. Fortunately for the King's Norton Board, the rateable value of its district is large, and the ratepayers are not very inquisitive. A fivepenny or sixpenny rate is therefore obtained with ease, and, if the ratepayers do not object, I suppose others need not find fault. I must, however, express my belief that cheaper sites might have been bought, and less ornate buildings erected. Elementary schools, indeed primarily for the children of the poor, and subsidised from local and imperial resources, should be provided in the cheapest possible manner consistent with permanence and efficiency. There is no need for ornamental brass gas-fittings, coloured glass screens, and other decorative articles, which, though not very costly in themselves, go to swell the bill, and could very well be dispensed with.

#### *Bath District.—Rev. H. B. Barry, Inspector.*

Though some schools are still held in old or adapted buildings, the schoolrooms in the district are generally very fair. More classrooms are, however, wanted. No infants' school should be built without a classroom, as the separation of the very young children is almost essential to discipline. Lobbies, too, are often not large enough properly to place hats, bonnets, &c. I recommend, wherever it is practicable, that each scholar should have a numbered peg. It is a bad example to the children to allow garments to be piled one on the other, or to be scattered on the ground. The school premises ordinarily, and not only just before the inspection, should be clean, neat, and well kept; yet there are parts of the premises which some managers tell me on the day of inspection that they have seen rarely, or then for the first time. More frequent washing of the rooms is also often desirable.

#### *Worcester District.—Mr. E. H. Brodie, Inspector.*

Minor improvements in out-buildings, warming, ventilation, &c., have been frequently carried out. It is still to be desired that the small, heavily-leaded windows, with their small diamond panes, through which struggles, in some village schools, a broken ray of "dim religious light," very fidgety to the eye, and of a headachy tendency, could be everywhere replaced by good square panes of glass through which might pour a generous flood of illumination, and which might be glazed against too intense a sun, or screened with blinds.

#### *Warrington District.—Mr. W. Scott-Coward, Inspector.*

The buildings vary much, many, too many, of the older ones, erected when notions of school organisation were as yet only in the embryonic stage, are no more than barely suitable, and make the school work more troublesome and arduous and less effective. The newer buildings are, of course, all more or less good; but even in them are found defects of sound, light, and ventilation which good school architecture should avoid. High-pitched roofs are bad for sound, light, warmth. Mullioned and traceried windows, with latticed panes, in my experience intercept much of the light, weary the eye with their many intersecting lines, and are not as well adapted for ventilation as those of a homelier style. The Board schools here, as elsewhere, are devoid of anything ecclesiastical in style, and are bright, cheerful, and ventilated even to draughtiness. I am far from wishing to see them adopted as models to follow. But I am sure that some of their advantages could be combined with the Gothic modified to suit modern school requirements, and that pretty as well as useful schools would result from the combination.

There are very few buildings now in which there is not a

separate room for infants, a matter of obviously great importance where boys, girls, and infants are taught in one department; and classrooms are more common than they were, though too often they are far too small. Good-sized classrooms are most useful in enabling teachers to separate the classes for instruction.

This most important element of good school organisation seems to me to become more urgent as the scope and aim of our national instruction widens. It seems to be next to impossible to produce the best results where the education of children in Standards I. and IV., V., VI. is being conducted in one room. Whenever it can be done, I urge the subdivision of large rooms and the isolation of classes.

The ventilation of the new schools I find to be generally satisfactory, not of the older ones. These depend upon the windows for what fresh air they get, which, in winter especially, is admitted scantily and rarely. On visits without notice one passes into the impurest atmospheres, where drowsy children are learning little, and devitalised teachers are working at half-power. Nobody in such rooms seems to have any perception of their want of pure air and unhealthy state. Ventilation should be *continuous*, and independent of the action of the occupants of the rooms. Tobin's tubes, admitting in a constant upward stream of cold air directly from without, if placed in sufficient numbers and adjusted at proper heights, are most efficacious ventilators. Besides, exits for the exhausted air should be placed in the roof, and the windows should open at the top. Open fireplaces are also good ventilators, and if properly constructed so as to throw more heat outwards than upwards, are effective warmers. The Manchester grate, when carefully put up, is one of the best warmers and ventilators I know; but if not carefully arranged it is likely to prove an expensive failure. Its great advantage is that it warms cold air led in flues from without into a chamber behind, from whence it passes again in flues into the apartment through gratings in the walls.

Lavatories and cloakrooms are increasing, though slowly. One of the former I should like to see in every school.

#### *Lincoln District.—Mr. C. H. B. Elliott, Inspector.*

The condition of the buildings is, as a rule, fairly satisfactory. The majority of the more modern schools are substantial in their structure and convenient in their arrangements. The number of schools which one is doubtful about passing in their present condition is extremely small. There were two years ago thirty schools which had not boarded floors; this number is now reduced to about fifteen, and I have reason to hope that in the course of a year there will be very few such remaining. The objection to tiled or brick floors is always met by the well-known argument on the part of managers, that the children are accustomed to them at home. The reply to this is very simple: 1. Children are not required to sit for five hours a day with their feet on a brick floor at home; they are required to do so at school. 2. Their rooms at home are smaller and more easily warmed, and the floor is consequently drier, and there is frequently a piece of carpet or a rug by the fireplace. 3. The school should be made as attractive as possible by being as comfortable as possible. Coughs and colds are more frequent where there is a brick floor than elsewhere, and I find that the teachers appear to suffer even more than the children; continuous standing on a cold floor is very trying for all teachers, especially for women, while a greater effort of the voice is required in these rooms than in others.

Improved means of ventilation have been introduced into many schools; some are still defective in this particular; in others fair means are provided, but are frequently not properly utilised, and sometimes not understood by the teachers. Sufficient advantage is not always taken of the opportunity which the ten minutes' interval in the morning and afternoon affords of thoroughly purifying the room. The air in small class-rooms in winter is often found to be exceedingly impure.

The subject of warmth is one on which it is difficult to speak with great certainty. In schools which happen to be visited only in the summer it is easy to omit to make proper inquiries on the matter. During the last two winters I have often found schools to be very cold, and have heard of many complaints being made by teachers and parents, but these seasons have been so exceptionally severe that it would be unjust to infer that reasonable care was not taken wherever a room was not found to be sufficiently warm. Very frequently the fire is not lighted early enough, and I have heard of cases where the managers grudge sufficient coal. In schools which are constantly visited by the managers such discomforts seldom exist. One of the most comfortable schools in this district is the Barton Wesleyan School, which is warmed by one of Musgrave slow-combustion stoves. The stove is placed in the middle of the room. The smoke and gases are carried up through the roof by means of an ascending flue, after they have passed through the two vacant chambers or secondary stoves which form a part of the construction of the stove. The fire is lighted once a week, and continues burning night and day with coke. The stove is also furnished with a hot-air chamber, which helps to warm the fresh air which circulates through the room. It is easily managed and well regulated, and is thoroughly effective. The absence of dust and smoke, and the little attention it requires, are great recommendations to its use, and the cost in fuel is less than that of

an ordinary fireplace. The fireplace as arranged by Professor Harcourt appears also to provide a very effective means of warming a room.

Light is usually plentiful, but some even of the newer schools are not well constructed in this particular; there is often an unnecessary amount of cross lights, and some schools which should have blinds are not provided with them. Frosted glass might be more frequently used. The girls' sight sometimes suffers from their doing very fine needlework in a bad light.

*Huddersfield District.—Mr. A. P. Graves, Inspector.*

By far the greater proportion of the schools in the district are church schools. There is a large group of them under the Huddersfield School Board's jurisdiction, a large one under the Saddleworth School Attendance Committee, and a larger one still under the Huddersfield Attendance Committee; altogether there are some 130 departments. Most of these are built on the old type, being deficient in classroom and porch accommodation, of unsuitable shape, and too often encumbered with Sunday-school fittings. Where there are classrooms these are generally small and ill-ventilated, the atmosphere suffering still further from the use of badly-fixed old-fashioned stoves, whilst too many of the playgrounds are insufficiently drained and in a very rough condition.

*Warwick District.—Mr. J. D. B. Faber, Inspector.*

Of the improvement effected in the buildings in my district during the last two years I am able to speak with almost unmixed satisfaction. With one exception, the premises are now in almost every case fair, in many very good. Boarded floors have been laid down in place of tiles, classrooms added, entrance porches built, offices improved, and new desks and apparatus supplied. The exception, to which I made allusion above, is the borough of Warwick. The public elementary school buildings in the borough are of a poor character, and quite unsuited to the requirements of the present day. Unless great efforts are made voluntarily I fail to see how the formation of a Board is to be averted. Large additions have within the last two years been made to the borough national schools, but these additions cannot make up for deficiencies in other school buildings within the borough. Moreover, the wisdom of these additions to an already unwieldy school has always appeared to me questionable, and I regret that the sum expended was not devoted to the building of a new group of schools upon a different site.

*Newport.—Mr. E. S. Mostyn Pryce, Inspector.*

To the all-important and difficult question of efficient ventilation I especially commend the various architects' attention. Considering the degree of internal perfection, and often external grandeur, which is reached in school architecture, it is to be regretted the demon of impure air so often reigns supreme.

## HITCHAM AND BILDESTON CHURCHES.

THE annual excursion of the members of the Suffolk Institute of Archæology was to the interesting churches of Hitcham and Bildeston.

At Hitcham the Rev. Canon Grant read a paper, for which information had been supplied by Mr. Pritchett, under whose direction the building had been restored. Canon Grant said that the church evidently belonged mainly to the period of great church building activity in this country—the fifteenth century—and he found no trace of any earlier building. It was, however, to be remarked that the part of the churchyard to the north of the church was evidently a very old burial-ground, very early remains having been found when graves were dug there. That part of the churchyard was not in use when he first went to Hitcham, and it had actually been consecrated by Bishop Turton not very long before, under the idea that it was a piece of ground newly added to the churchyard. For some time no graves were dug there, as there existed in the parish a very common prejudice against burials on the north side, but the south side becoming very fully occupied, he insisted on the graves being dug on the north side, and in every case of a grave being made, very old remains had been found. The earliest part of the present church appeared to be the chancel, which dated from the fourteenth century. That date, however, only applied to the north wall, as the east and south walls were taken down and rebuilt at the restoration, but the style of the original building was retained as nearly as possible. The south wall was very much out of the perpendicular, the east wall was in very bad repair, and the east window was of a very debased style. However, there were found remains of an old east window built up in the wall, and that which was now to be seen in the east end was very much in the style of those remains. The nave belonged to the fifteenth century; the arches, piers, and clerestory were of the early part of that century. The walls of the aisles were probably of the same date, but the windows were evidently later. The tower was probably of early fifteenth century. A remarkable feature in the tower was that its eastern buttresses rose from the floor of the nave and overlapped the western arches of the nave. This peculiarity was also found in Cockfield Church, which had a general resemblance to

this, and there was a still more remarkable example in Bramford Church, where the buttresses of the tower cut off nearly half the adjacent arches. There was an appearance of the buttresses having been at one time exposed to the weather, which would lead to the conclusion that the present aisles were built up to the tower. The roof of the nave was of the fifteenth century, with additions of much later date. The lower part had been mutilated by the defacing of all the figures. It would appear, then, that at the end of the fifteenth century the church externally was much what it was now. Subsequently to that time there was evidently a destruction of all carved human figures, no doubt as being superstitious. It might fairly be conjectured that the ends of the hammer-beams of the roof had such figures upon them, and that they were destroyed. A roof, a good deal resembling it, was to be seen at March, in Cambridgeshire, and there were figures of angels. One or two grotesque figures remained, so that it appeared that only human figures were destroyed. At all events the present ends of the lower hammer beams, which were heraldic devices, were clearly of the seventeenth century—they had the monogram "I.R." on one of them, and also the thistle as well as the rose, showing that it was after the union of the crowns of England and Scotland that the work was done. These were evidence that some interest was taken in the ornamentation of the church during the reign of James I., and a monogram "C.R." in the south aisle showed that the work was continued into the following reign. It would be observed that each heraldic device was surmounted by a coronet, which appeared to be that of the Prince of Wales, and there was in one place a device resembling his plume of feathers. If it was the Prince of Wales's feathers it was a matter of some curiosity what the Prince of Wales had to do with the church. The living was, he believed, originally in the gift of the Bishop of Ely, but came into the patronage of the Crown in the early part of the seventeenth century—he had seen it stated that the date was 1604. But independently of any royal influence there was a way of accounting for the work done at the period in question by attributing it to an incumbent of the parish, whose name he was not able to recollect, who was deprived under the Commonwealth. That incumbent was a man of considerable private fortune, and the donor of the communion plate, the date of which was about 1639 or 1641. The incumbent in question was an eminent man, and it was said that in all probability he would have been made a bishop, but he died in 1659. During the time of the Commonwealth he greatly helped the clergy who were deprived of their livings, contributing from his private fortune. It was quite conceivable that he spent money on the church. He (Canon Grant) did not find that the architect gave the date of the south porch, except that it was later than the nave. It was very like the corresponding porch in Bildeston Church and the north porch of Freston. It was now under restoration as a memorial to the late rector, Professor Henslow, whose family and friends had taken a chief part in raising subscriptions. The history of the church from the Commonwealth to a recent date was that of the majority of the churches of the country—neglect and worse than neglect—alterations supposed to be improvements. The church was seated with carved oak benches of the fifteenth century, and much of the carving was very good. Most of these seats were mutilated for the purpose of being converted into pews. The carved poppy-heads were sawn through to let in the deal sides of the pews. One would have supposed that it would have been less trouble to cut the deal boards, but that was not done. At the restoration of the church these benches had to be removed, being unfit in their then state for use, but all were preserved under the idea that some day there may be the means of restoring them. It was found necessary also at the restoration to remove the lower part of the rood screen, which consisted of painted panels, on which were figures bearing the instruments of the Passion. The figures were too much defaced to be replaced as they are, but the screen has been carefully preserved, and it was a problem not easy of solution how it was to be made suitable for being replaced. He might say that among other things which at the restoration had to be obliterated were mural paintings between the nave arches. One only could be made out, and that was between the second and third arches from the east. There were appearances of colour when the wall was wet; and a friend of his, who had had experience of mural paintings in another church, with very great difficulty removed the outer plaster, and discovered a painting beneath it, showing a very large and fine head. Other traces were found, but nothing that could be made out. The head it was found impossible to restore or preserve, and that he (Canon Grant) really believed was the only thing that was obliterated in the restoration of the church. One part of the restoration was altering the level of the nave to that which it originally was, this being shown by the bases of the piers. As to monuments, there were some very fine stones in the chancel, from which, however, the brasses had been removed. One was a very long one, over ten feet long. With these exceptions the monuments were extremely scanty.

At Bildeston, the Rev. James Beck described the church. At the close of the fourteenth century it was probably a small Decorated one, consisting of a nave and chancel, and a tower of somewhat later erection. The nave and chancel falling into decay, or probably requiring to be repaired, were pulled down, and the

present church raised upon the old site. The marks of the old roof might be seen against the tower wall at the present time. These walls were added, and clerestory windows were put in, and the present roof, which was 48 feet from the beam down to the floor, constructed. When a craze for Perpendicular work set in over the Eastern Counties in the early part of the sixteenth century, the body of the church was pulled down, leaving the tower intact, and it was out of all proportion to the present building. The Decorated windows of the old church were probably preserved and inserted in the new building, two in the side walls of the chancel, and the other three at the end of the aisles. The window at the east end of the south aisle was a Perpendicular one, similar to those in the aisles; but within the last twenty years it was removed, and the present Decorated window substituted. The transomes, which were a characteristic feature of the side windows in the aisles, and of which the marks could still be seen in the mullions, were also removed at the same time—why he could not say. The window at the east end was formerly a Perpendicular one, and one of the finest specimens existing of the period. It has also been swept away, and perhaps the less said about it the better. Within the last fifty years a carved rood screen stood between the first two pillars, and the pulleys for raising the rood were removed in repairing the roof in 1819. The rev. gentleman exhibited the pulleys, and he said he hoped ere long to replace them in their original position. In the north wall is the rood staircase, perfect, but the entrance to it was now blocked up. In order to admit of its construction, the wall was made to project on the exterior. He considered that the roof of this church was somewhat peculiar for a village church, extending, as it did, in one continuous level over nave and chancel. His friend, the Rev. C. R. Manning, however, had that day told him that this was not unusual in Suffolk and Norfolk churches. In all probability the hammer beams were formerly ornamented with carved figures of angels holding scrolls, but about one hundred years ago a man of the name of Welham, a carpenter, of Bildeston, was ordered by the churchwardens to take them down, and burn them as idolatrous images. This was no doubt about the period when Whitfield was so very popular in the Eastern Counties, and very likely the churchwardens were strong disciples. There were twelve clerestory windows on either side, ten over the nave and two over the chancel, but the latter were filled up a few years ago. The miserere seats in the chancel, which were much mutilated, were originally brought here from the chapel of St. Leonard, which once stood in the town, connected with the old Bridewell, afterwards turned into a workhouse, and pulled down some years ago. After they were removed to this church they were used as seats in the north aisle, but were subsequently moved to the chancel, and in restoring the chancel he hoped to utilise them as choir seats. The porch was a very good specimen of Perpendicular work. The lower stages of the buttresses have good flush panelling; the upper stages, niches and good canopies. The arch is within a square head, and over it a good niche, flowered cornice and battlement. The south door, continued the rev. gentleman, is a good piece of Perpendicular panelled work. Over the porch is a parvise or priest's chamber, once lined with iron. The door is a very strong one, with a most complicated arrangement of spring bolts and bars. The staircase leading to this chamber was pulled down in 1878. On the west wall a large fresco painting, representing St. George and the Dragon was discovered, in 1850. These frescoes were thought to be superstitious vanities, and were painted over, and can never be restored. Under the chancel was a crypt, afterwards converted into a burial-place for the Revett family, with an entrance at the east end of the north aisle. The windows lighting the crypt were filled up a few years ago. There are several monumental slabs in the chancel floor, to the memory of the Revett and Beaumont families, William Sparrow and Benjamin Brundish, rectors of the parish, Bartholomew Beale, and Elizabeth his wife, and others. There were formerly several brasses in the nave and aisles, but all of them, with one exception, have been stolen or lost. In the nave there is a brass of a lady, measuring 1 foot 10 inches, affording a good example of Elizabethan costume.

The font is octagonal, of Perpendicular work, with sculptured panels, now much defaced, of the emblems of the Four Evangelists, alternating with angels bearing shields, on one of which is the verbal symbol of the Trinity, the words effaced; on another a chalice with two streams of blood flowing into it; the other two are worn quite smooth. Round the pedestal were eight grotesque figures, as in the font at Barking, of which four have entirely disappeared. In the south aisle is a piscina with elegant double canopy in stone, under a square hood. The chapel in which it originally stood is said to have been dedicated to St. Catherine. The belfry contains a peal of six bells. In conclusion, the Rev. James Beck said there was a portion of the church, at the west end of the north aisle, as to which he should like to have the opinion of gentlemen who were better acquainted with church architecture than he was. It was evident that something existed there, and he should like to know what it was. At the west door of the tower there used to be a porch extending some distance out, but that was pulled down some years ago. He was sorry that there were very few traces of the old church in the way of drawings. He had photographs of the

church as it stood when the old east window was in existence, which afforded a good idea of what the style was. The registers of the church dated from 1558. The communion-plate consisted of an Elizabethan chalice, and two patterns of another chalice of a later date. There was an old pewter flagon which still had a place in the old vestry.—The reports are from the *Ipswich Journal*.

### PROSPECTIVE EXPLORATIONS.\*

IF there were at the present moment in this country a desire to begin a new era of exploration, there would be found no scarcity of eligible scenes where Hellenic civilisation had once flourished. From Greece itself we are practically shut out so long as there is no English institute in Athens gradually to prepare students for the superintendence of work of this kind. For it is now an obvious fact that qualifications which at times have passed in Asia Minor and elsewhere would now be the subject of ridicule under the active criticism of students resident or travelling in Greece. High qualifications are required when the explorer is allowed no right over what he finds except that of being first in the field to explain and circulate its merits. But they may be dispensed with when the sculptures or other antiquities brought to light become a solid possession of the finder or his patron. Here, as elsewhere, England regards possession as nine points of the law. She must therefore look to lands where it is possible. It is possible, but not without difficulties, in Asia Minor, and it is possible in Cyprus without any difficulty.

Except the sculptures of the Parthenon, little has survived from antiquity that can surpass or compare with those obtained by Sir Charles Fellows in Lycia and deposited in the British Museum. Yet he left much of Lycia unworked; and as he left it so it has remained, but for the quite recent expedition of the Austrians. They may be said to have annexed it archæologically for whatever it is worth. At Ephesus the English operations ceased with the clearance of the site of the temple, leaving untouched the deep accumulation of alluvial soil around it. Very possibly on the fall of the temple much of its sculpture had been projected on all sides to a considerable distance, and on this theory it is natural to expect, as Mr. Wood does, that a clearance of the surrounding soil would be attended with fruitful results. He commends his plan of further operations also by the circumstance that the land to be worked on is still the property of this country. Apart, however, from the site of the temple, there must have stood in its proximity many statues and lesser buildings of which remains might still be found, and perhaps there is no better method of reaching them than by proceeding outwards from the temple on all sides. Otherwise a more uncertain prospect could not well be surveyed than the broad flat plain of the Cayster, covering with its deep alluvial soil no one knows what.

On the other hand, there would be no great uncertainty in opening the ancient tumuli of Lydia. From the attempts already made by Mr. Dennis and others, it is hardly to be expected that anything imposing in the way of art would be met with. Yet at the worst the form of construction adopted in these sepulchres would be ascertained, and this would be no small matter in these days, when the history of elementary skill occupies the attention of so many thoughtful persons. Without leaving Lydia there is Sardis waiting to be explored; or, going northward, there is the Troad, whither the successes of the Germans, including Dr. Schliemann, have attracted a small band of Americans, less prepared, perhaps, as yet for excavating than for prospecting. Even well into the interior are many sites calculated to repay favourably the increased cost of advancing upon them. In every case there will be, besides expense, many vexatious difficulties.

When General Cesnola had completed his excavations in Cyprus, the vast quantity of antiquities he had obtained encouraged a belief that he had fairly ransacked the island. But this belief was soon after dispelled by the arrival of Major Cesnola with another huge collection, said to be in many respects of great importance, though hardly rivalling that of his more fortunate brother. General Cesnola's services to classical archæology are justly reckoned as of the first order. Other explorers of Cyprus in times past have met with no startling fortune, and so far have contributed to the prospects as they now stand an element of uncertainty. The tombs may be relied on for quantities of common pottery, specimens of which already abound in museums and even in private collections. With this it would not be easy to deal. At the same time there are many parts of the island not yet explored, and from them it might reasonably be hoped that the tombs would yield occasionally a higher class of vases, which would repay the search and redeem the character of the ancient Cypriotes in respect of this branch of art. It is not as if they had altogether neglected it, and, like the people of Tanagra in Bœotia, taken rather to terra-cotta statuettes for the furnishing of their tombs. On the contrary, the Cypriotes would seem to have been as distinguished for the quantity as for the commonness of their pottery, unless by experiments in new localities matters assume a

\* From a paper by Mr. A. S. Murray in the *Nineteenth Century* for September.

different complexion. As yet most of our specimens have come from one district, and exhibit none of that love of artistic enrichment which carried the Greeks so far beyond consideration of the intrinsic value of the article operated on. The clay of a vase seemed at the outset a poor substance for the Cypriote, and he cared little apparently to refine it.

The sculpture no less than the pottery is largely pervaded by a dense commonness of skill as well as of material. Yet exceptions like the two splendid marble sarcophagi found by General Cesnola raise the hope of obtaining examples of this art which would make us independent of New York when we have a mind to study this subject. For the history of architecture in Cyprus almost nothing has been done, though the field of inquiry is extensive and apparently not costly to work. There need be no expectation of marvels in design and construction. The most to be hoped for would be evidence of many forms of transition between Oriental and Greek methods of building. The antiquities of Cyprus have already proved a key to more than one mystery. They are not things of average beauty and attraction that appeal to the cultivated classes generally. They are peculiar, and appeal to the special student.

It would be unjust to conclude without acknowledging the intelligence, zeal, and liberality of the Greeks themselves in the conduct of explorations, such for example as those at Spata and Epidaurus. For several years they have been making preparations to excavate at Eleusis, where they have been obliged to build a new village for the inhabitants whose houses it will be necessary to pull down. At Tegea in Arcadia they have the prospect of heavy expenses before they can hope to uncover the famous temple built there, and sculptured also by Scopas. The modern village of Piali is built above it. But their most pressing undertaking is doubtless at Olympia, where they have inherited the task which the Germans left incomplete; a large district still remains deeply covered with alluvial soil. It is an outlying district, where there cannot be much hope of important rewards, and we are therefore bound to sympathise with the Greeks in finding this vast amount of labour and expense, so to speak, thrust on them. It is for this reason that the search for them cannot be delayed now without injury.

## THE LIGHTING OF PUBLIC LIBRARIES.

A PAPER was read by Mr. P. Cowell, of Liverpool, on the Electric Light in Public Libraries at the Conference of Librarians. His observations were mainly based upon his experience at the Liverpool Library and Picton Reading-room. He spoke with regret of the destruction of books going on in public libraries through the excessive heat and noxious atmosphere consequent on the use of gas for lighting purposes, and also looked at the lighting question as one affecting the comfort and health both of readers and officials. In Liverpool they were trying several modes of protecting the books from the effects of the gas, such as varnishing, binding liberally in buckram, &c., societies' Proceedings, specifications of patents, &c. When gas was used the temperature invariably rose during the evening to an injurious extent; and to open doors and windows was productive of colds, and brought remonstrances from readers. The Picton Reading-room was circular in form, 120 feet in diameter, 60 feet in height, and the books were arranged around the walls, while the table was in the middle. It had been lighted for some time past by three arc-lights placed on a central pedestal, and within an opaque glass shade, the shape and position of which was that of a large bowl or inverted umbrella. The thermometer readings showed that whereas when gas was used the temperature rose between 4 P.M. and 10 P.M. as much as  $11^{\circ}$  in the lower part of the room and  $13^{\circ}$  in the gallery, with the electric light it rose but  $2\frac{1}{2}^{\circ}$  below, and in the gallery actually fell  $2^{\circ}$  in the period mentioned. One of the most pleasing advantages of the electric light was that persons whose only spare time was in the evening, and who found a delight in sketching, illuminating, &c., from originals at the library, could do so by its rays. Then there was the advantage of freedom from danger of fire, provided the wires and other accessories were arranged and controlled by competent persons. In regard to cleanliness there was a great advantage, and periodical cleanings were less frequently required. The vitiation of the air caused by gas was entirely absent, and the members of the library staff consequently retained a feeling of cheerfulness and freshness almost to the close of the day's labour. He could not speak so enthusiastically with regard to the expense, but that had been greater in this case than it would be at the present time, because they at the Liverpool Library had been somewhat unfortunate in that respect; but he did not hesitate to say that in libraries in the large towns, having in view recent improvements in the mode of lighting, the arc electric light could be made to pay directly.

During the subsequent discussion Mr. Frost alluded to the danger of fire which arose where the light was badly installed, by persons who were unqualified for the work. He recommended the incandescent in preference to the arc system.

Mr. Sanders said the Royal Academy had discarded the incandescent light as a failure, and returned to gas, as the former gave a reddish light. The incandescent light did well for small rooms.

Mr. Walford testified to the advantages of the electric light as installed at the Picton Reading-room.

Mr. Garnett, of the British Museum, spoke of the benefits consequent upon the introduction of the electric light into the Museum reading-room, which was now open until 8 P.M. instead of 4 P.M. in consequence.

Mr. C. W. H. Wyman contended that the real question was as to the cost of the electric light as against the cost of gas. The City had been lighted by all the leading systems, with the result that the authorities had resolved to discard them all; at present the electric light cost four times as much as gas.

Several other speakers in their remarks pointed out that the arc lamp was the one for open spaces, and the incandescent lamp the one for rooms and places where there were book-stands or other objects to throw shadows.

## CHURCH BUILDING AND RESTORATION.

**Crieff.**—A new Free church, the plans for which were prepared by Mr. J. J. Stevenson, of London, and Mr. R. Ewan, of Glasgow, has been opened. The plan follows that of Dunblane Cathedral, having tower, spire, and windows of similar construction. The building is seated for 860 persons, and has cost about 5,500/. The contractors were—Mason-work, Messrs. Donaldson & Son, Crieff; joiner-work, Mr. Peter M'Gregor, Crieff; plaster-work, Messrs. Christie & Sons, Crieff; slater-work, Messrs. T. & J. Philips, Crieff; plumber-work, Mr. C. Anderson, Crieff; painter, Mr. Jas. Armstrong, Crieff; heating, Messrs. Comb & Sons, Glasgow; glazier-work, Messrs. Adam & Small, Glasgow.

**Loftus-in-Cleveland.**—A new Catholic church, built from the designs of Mr. Martin Carr, of Middlesbrough, by Mr. Dickinson, builder, of Saltburn, has been opened. The church, which is dedicated to St. Joseph, is built of brick, with stone and terra-cotta dressings, comprises nave, sanctuary, and sacristy, and provides accommodation for 300 persons.

**Horrabridge.**—A Bible Christian chapel has been opened about a mile from Horrabridge. The building is erected of stone in plain Gothic style, and was designed by Mr. James Crocker, architect, of Exeter. The work has been carried out by Mr. Blowey, of Mutley.

**Long Marston.**—The corner-stone of the new church of All Saints has been laid. The nave and chancel walls are half built, and the aisle has been begun. Messrs. Carpenter & Ingelow are the architects. The builder is Mr. Fincher, of Tring; the mason, Mr. Lingard, Berkhamstead; joiner, Mr. Smith, Tring; and the clerk of works, Mr. F. E. Smith.

**Crowle.**—The parish church, which has been rebuilt from the designs of Mr. Preedy, architect, has been reopened. The building, though enlarged, has been restored upon the old lines. The edifice is cruciform, and the style is Early English, with Norman chancel. All the old materials have been used as far as practicable in the rebuilding. Interesting features of the old fabric—the old Perpendicular porch, with its carved woodwork, the best of the old windows, the south transept roof, and the Purbeck marble lectern of the twelfth century—have all been re-erected in their proper places. Local stone has been used in the extended walls, with Ombersley stone dressings on the outside, and Bath stone dressings in the interior. The work has been done by Mr. J. Inwood, builder, of Malvern.

**Darwen.**—The foundation-stone of a new church, to be dedicated to St. Edward, has been laid. It will be built of local stone, in Gothic style, from the designs of Mr. Simpson, of Bradford. Accommodation is to be provided for about 400 persons.

**Northampton.**—The old chapel of St. John's Hospital has been restored, and was lately reopened for its pristine purpose by Cardinal Manning. The work has been carried out by Mr. Anstey, builder, under the direction of Mr. Nicholl, architect, London.

**Maidstone.**—A Wesleyan chapel has just been opened in the West Borough. It is built of Kentish rag stone, with Corsham Down and Box Ground stone dressings, the style being Gothic of the Early English type. In the rear, and communicating with the chapel, is a schoolroom and an infant classroom with folding doors between. There is also a classroom and a minister's vestry. Accommodation is provided for about 400 persons on the ground floor, and provision is made so that galleries can be added, if required, at some future time. The seats and pulpits are of stained and varnished deal. The ventilation is provided for by means of upright inlet shafts and a Boyle's patent extractor on the roof, the latter being enclosed in a turret 20 feet high above the ridge. The architects were Messrs. Ruck, Son & Smith, of Maidstone. Mr. R. Avar was the builder.

**Revelstoke.**—The new parish church has been opened. The style of the building is Perpendicular, the materials being a local dun stone relieved by grey Dartmoor granite. The plan comprises nave, north and south aisles and a north-west porch. The site sloping, a vestry and crypt has been constructed under the south aisle. Mr. J. P. St. Aubyn is the architect.

## SCHOOL BUILDINGS.

**Halifax.**—The building erected between Prescott Street and Oxford Road, as a Higher Board School, has been opened. The school, designed in Queen Anne style, consists of two storeys, and is built of local stone. Mr. Richard Horsfall, of Halifax, is the architect, and the contractors were:—Masons, Messrs. Charles Bolton & Co.; joiner, Mr. J. Smith, Stannary; plumbers, Messrs. Stafford & Son; slaters, Messrs. Rushworth & Firth; painter, Mr. Marshall; heating apparatus, Mr. King, of Liverpool. The school is to accommodate 560 children, and the total cost, apart from site and furniture, is about 6,000*l*.

**Birmingham.**—The contract for the erection of the Princess Alice Orphanage has been let to Messrs. J. Wilson & Sons, of Handsworth, and the foundation-stone will be laid on the 19th inst. The site is on the Chester Road, facing which will be a block of connected buildings nearly 250 feet in length, consisting of the master's house, the offices and board-room, the belfry and great hall, the kitchens, store-rooms, bakehouse, and kitchen offices. Behind the administrative buildings, on the right hand and on the left, the cottages or "homes" will be placed at intervals. When complete there will be twelve cottages for boys and twelve for girls, each providing accommodation for about twenty-five children, together with matrons' rooms. These farm-cottages will stand detached in separate plots of ground, and will be of different designs. Schools, workshops with facilities for carrying on about a dozen industries, baths, farm buildings, and a farm bailiff's house, will be built in various parts of the estate; and the whole will be completed by a suitable chapel. The architect is Mr. J. L. Ball.

**Aston.**—At the meeting of the Aston School Board on Tuesday, the chairman, Mr. Stone, stated that it was the custom at the commencement of each new year of office to sum up the work effected. One school had been opened during the year in Lozells Street, providing 1,015 additional school places, and this brought the Board-school accommodation in the district under their charge up to 8,461 school places. In 1875 there were provided 4,043 school places by public elementary schools, 2,616 being by Church of England schools, 575 Roman Catholics, 766 Wesleyan and British, and 86 efficient private ones. At the close of their official year—July 1882—there was accommodation for 12,092 children, an increase of 8,049 in seven years, 8,461 being provided by Board schools, 2,756 by Church of England, 579 by Roman Catholic, and 300 by Wesleyan, the decrease shown between 1875 and 1882 in the Wesleyan and British school accommodation arose from the Gower Street and Erdington schools having been transferred to the Board, and were now included in the returns of Board schools.

## NEW BUILDINGS.

**Otley.**—New Sunday-schools have been built at Otley. The schools are in plain Gothic style, built in a substantial manner of idle wall-stones, with local ashlar dressings. The large school-room is 73 feet 6 inches by 31 feet. The entrances to this room are by two porches in the front, and four classrooms, average 14 feet by 16 feet, are arranged on the south side of it, with communications to each from the large room. The inclination of the ground has enabled the architects to obtain under these classrooms a large room (53 feet by 14 feet), intended for use of boys; also a tearoom, which may be used as an additional classroom if required. An internal staircase connects the two floors, and an outer door is provided for lower rooms, level with yard. The large room is calculated to seat, when used for concerts or entertainments, nearly 600 people, and is exceedingly lofty, and provided with Boyle's patent air-pump ventilators. The works have been carried out under the superintendence of Messrs. Fairbank & Wall, architects, of Bradford and Otley; and the contractors have been as follow:—Masons, Cordingley & Wildman, of Idle; joiner, Wm. Hartley, of Ilkley; plumber, Squire Farrand, of Otley; plasterers, J. & W. Chaffer, of Otley; slater, James Smithies, of Bradford; and painter, G. R. Foster, of Otley. The iron railing and gates have been provided by Exley & Sons, of Otley.

**Sittingbourne.**—A hospital for treatment of infectious diseases has been opened by the Sittingbourne and Milton Joint Hospital Board. The work has been carried out from the designs of Mr. W. Leonard Grant, of Sittingbourne. The hospital is erected on a site at Keycolhill, about four acres in extent, given by the late Mr. G. Smeed, and the estimated cost of the whole was 5,000*l*. The building is intended to provide accommodation for twenty-four patients in eight wards, contained in two pavilions connected by open corridors, 6 feet in width, with a central administrative block. The Local Government Board require the provision of 12 lineal feet of wall space, 144 superficial feet of floor space, and 2,000 cubic feet of air space for each bed, and these figures have been strictly adhered to, except the last, which has been slightly increased by carrying the ward ceilings some distance into the roof. The four small wards have been provided partially for the use of private patients and also as convalescent rooms when not otherwise engaged. The whole of the buildings are lighted with gas,

and communication between the different blocks is provided for by electric bells. At the rear of the administrative block is situated a range of buildings containing washhouses, disinfecting chamber (fitted with a specially made gas disinfecting apparatus), laundry (with slow combustion ironing stove), and ambulance house, and behind these buildings is situated a detached mortuary, fitted up with slate shelves. Special attention has been paid to the drainage arrangements, which are carefully cut off from the interior of the buildings, all pipes being made to discharge in the open air with a short length of surface gutter leading on to a Lean's patent gully. The buildings are erected of local bricks, the walls being built hollow to prevent penetration of damp, the gables being hung and the roofs covered with Hollingbourne plain tiles secured by metal pins.

## ARCHÆOLOGY.

**Excavations at Pompeii.**—The Naples correspondent of the *Daily News* writes:—The last house excavated at Pompeii in Isola V., Regione VIII., is of an anomalous kind. It is situated at the south side of the isola. Its construction is quite unusual, as it possesses no proper atrium. On entering the doorway you find on your right a small stove in the corner of the passage, and on the left is the kitchen proper, with a room for slaves. Then to the right is a row of columns, forming a rectangular space, in the midst of which is the triclinium with the reclining bed formed of masonry, and in the centre a cylindrical table covered with slabs of marble geometrically arranged. The wall-paintings of this open space are not of great value; there are heads of Medusa, hippocorpi, and fantastic birds. Returning into the passage, there is on the left, next to the kitchen, an exedra with walls ornamented with white and yellow squares, divided by columns, decorations, and festoons, all in fresco. At the entrance of this room are two strange figures; on the left an infant surprised at the sight of a large rat issuing from a trap, and on the right the same infant trying to catch the rat. On the left wall is a medallion with a small figure, two cupids, and two flying geniuses, one with a pastoral staff in the left hand and a bunch of grapes in the right, the other with the staff in the right hand and the left hand supporting a basket on the shoulder. The opposite wall is in a bad condition, so that nothing can be distinguished but the faint traces of a similar medallion. This room was covered, and above it and the kitchen was a second storey, to which access was had by a staircase at the end of the ground-floor passage and by a similar passage above. Behind the exedra (always to the left of the passage) comes an enclosed garden. A window into this garden gave light to the staircase. At the extreme end to the right is another small room, with a window opening into the triclinium. This room had another above it, and the sole connection between this upper room with the others on the left was by means of the passage on the second floor. Many vases, shells in bronze, several gold rings with engraved stones, and amphoræ were found in this house, and six skeletons. A walled-up door on the left wall of the exedra makes it probable that the house was once a portion of some other larger dwelling, and that it, like so many others, had been sold separately and undergone various changes.

## ENGINEERING WORKS.

**The Drainage of the Fens.**—Mr. W. Rigby, of Worksop, the contractor for the new works at the Grand Sluice, Boston, has just commenced operations. The present Grand Sluice was built a little over a century since. The foundation-stone was laid by Mr. C. Amcotts, on March 26, 1764, and it was opened by the engineer, Mr. Langley Edwards, on October 15, 1766. At the time of its erection the sluice was looked upon as a work of great magnitude. Its capacity of clear waterway is 50 feet wide, with three pairs of doors pointing to the seaward, to shut with the flow of tide. A fourth opening was built by the Navigation Commissioners, whose rights were purchased by the Great Northern Railway Co. Each of the archways is furnished with drops or draw-doors on the land side, which are shut occasionally, in order to retain fresh water in dry seasons for the use of cattle and for navigation purposes. The top of the draw-doors is gauged to such a height as to retain the water of the river not higher, at ordinary seasons, than two feet below the medium surface of the lowest lands. Some of the leading engineers of the present century have pronounced the sluice to be a great impediment to the drainage, and by stopping the tidal waters it has caused the haven of the Witham to silt up, and neutralised the scouring action of both fresh and sea water. The works now in progress are undertaken by the General Commissioners for Drainage by the River Witham, by virtue of an Act of Parliament passed in 1881, by which the Commissioners are empowered to spend 50,000*l*. on the improvement of the river between Boston and Bardney and the enlargement of the Grand Sluice. The contract for the latter part of the work amounts to 9,932*l*. The work undertaken is an additional archway with a sill about four feet lower than the existing outlets.

## GENERAL.

**Mr. G. G. Hoskins, F.R.I.B.A.**, has prepared designs for new printing and publishing offices for the Northern Counties Constitutional Newspaper Company (Limited), to be erected in Crown and Quebec Streets, Darlington. The work will be proceeded with at once.

**Sir J. A. Picton** has been selected as President of the Conference of Librarians to be held in Liverpool in 1883.

**Messrs. Taylor** have cast the new bell for Manchester Town Hall. The metal consists of thirteen parts of pure copper to four parts of tin. It will bear the inscription, "Ring out the false, ring in the true."

**Mr. F. R. Wilkinson** has placed at the disposal of the Ancoats Recreation Committee about 100 drawings and pictures, for exhibition during the month of October. The drawings will comprise some examples of the early water-colour school, about forty, by the late William Hull, of Oxford and Cambridge, and a series of Spanish subjects, not hitherto shown, by Mr. E. Bancroft. The oil-paintings include Mr. Madox-Brown's large picture, *Wycliffe Reading his Translation of the Bible to John of Gaunt*.

**A Design by Mr. T. Lewis Banks** has been adopted by the committee of the West Cumberland Liberal Association, for the new hall, clubhouse, post-office, shops, &c., at Workington.

**The Bishop of Bangor** on Tuesday opened a church which has been erected at Towy as a public memorial to the late Mr. W. R. M. Wynne, the Welsh archaeologist and antiquary, who for many years represented Merionethshire.

**The Earl of Egmont** has given 1,000*l.* to the Dean and Chapter of Cork to erect vestries for the clergy and choir of the cathedral.

**Mr. W. Herbert Johnstone**, of the Manchester Academy of Fine Arts, has been commissioned to paint a presentation portrait of Mr. Robinson, several years a member of the Swinton and Pendlebury Local Board.

**Mr. Hope Johnstone**, the hereditary keeper of Bruce's Castle, Lochmaben, has intimated his consent to an opening up of the inner fosse of the castle, which runs to the loch on each side of the peninsula. When the castle was dismantled by the Government of the day, after a Jacobite gathering in 1774, the outer fosses seem to have been completely filled up, but the inner one was never entirely filled, and the portion immediately in front of the castle ruins still contains a considerable depth of water. It is expected that numerous interesting relics will be found.

**The Dean and Chapter of Ripon Cathedral** have taken measures to improve the architectural appearance of the cathedral from the west by removing a large block of buildings situated at the north-west corner, which will have the effect of bringing into view the whole of the west front in approaching from Kirkgate. The roadway along the north of the cathedral will be improved, and trees and shrubs planted near the wall.

**Mr. Joseph Pettitt**, the artist, died at his residence, Balsall Heath, Birmingham, on Saturday last. Mr. Pettitt painted a considerable number of views of Swiss scenery for the late Mr. Joseph Gillott, of Birmingham.

**The Mayor of Hereford** has been presented with an official hammer, made from a piece of oak from the Old Town Hall, built by Abell in 1620, and pulled down in 1862.

**Messrs. H. Shearer & Co.** have obtained two important contracts—one from the Trinity House for the supply of granite for the new Bishop's Rock Lighthouse, and the other from the Admiralty, for a dock at Haulbowline. It will be remembered that all the stone for the new Eddystone Tower was supplied by Messrs Shearer in six months less than the contract time.

**The Cathedral of Providence**, Rhode Island, is to have 122 stained-glass windows, for which an order has been given to the Tyrolese glass-painters by Mr. P. Keely, the architect.

**Mr. J. Riddell** is engaged on a life of the late E. H. Baily, R.A., the sculptor.

**The Dawlish Local Board** have approved of a committee recommendation advising the acceptance of an offer from Messrs. Bayley & Sons, of Poole, to light the town with mineral oil, subject to a trial proving satisfactory.

**The Manor House, Everleigh**, in Wilts, belonging to Sir John D. Astley, Bart., which was burnt down at Christmas, is being restored, under the supervision of Mr. Birch.

**The Yarmouth Town Council** have decided not to demolish the old Town Hall. It is to be retained with a view of its being utilised at some future time for a museum, or some such other public purpose.

**The Hundred of Hoo Railway**, a short line connecting the North Kent section of the South-Eastern Railway with the new port called Port Victoria, near Sheerness, was opened on Saturday.

**The Kilmarnock Masons.**—At a meeting of master builders, held on Monday evening, it was unanimously agreed that the standard wages of the workmen, from and after that day four weeks, should be reduced from 7*d.* to 6½*d.* per hour, and, further, that the hours of labour be ten per day, or fifty-seven per week, instead of fifty-four as at present.

**The Social Science Congress.**—The inaugural address of the president (Mr. G. W. Hastings, M.P.) will be delivered in the Mechanics' Large Hall, Nottingham, on the evening of Wednesday the 20th inst. The presidents of the different departments will deliver addresses in the same hall at 10 o'clock on the mornings of the following Thursday, Friday, Saturday, Monday, and Tuesday respectively, and the sectional meetings will take place an hour later on each day in the University College. The concluding meeting will be held in the Mechanics' Hall at noon on Wednesday the 27th.

**The Birmingham and Midland Institute Lectures** will recommence on November 3, with an address from Mr. J. A. Froude. A course of lectures on "Decorative Art" will be given by Mr. J. H. Chamberlain. In the archaeological section papers are to be read by Mr. J. A. Cossins, Dr. Langford, Mr. W. G. Wetton, Mr. Sam. Timmins, and Mr. Edwin Smith; the subjects being the excursions made by the section in 1882, illustrated by Mr. John Cotton; Birmingham at the time of Leland's visit; St. John the Baptist's Hospital at Coventry; Old Birmingham Books; and Wootton Wawen Church.

**A Committee** has been appointed to report on the possibility of lighting the city of Bath by means of electric light.

**The Cardiff Public Hall Company** have instructed Messrs. James, Seward & Thomas, architects, to obtain tenders at once for the erection of the new buildings and the adaptation of the present block (Queen's Chambers) to hotel purposes. The company propose to complete and open their hall before the holding of the National Eisteddfod at Cardiff in 1883.

**The Beriot Theatre, Louvain**, was destroyed by fire on Monday last. The loss is estimated at 200,000 fr.

**The Leamington Town Council** have received a letter from Messrs. John Parnell & Son, builders, Rugby, complaining that their tender for the new Municipal Buildings was not accepted, although it was the lowest, and adding that the mere fact of their tender not being accepted under the circumstances was calculated to have a very injurious effect upon their position as builders. The letter having been read, it was stated that the contract was given to Mr. Fell on account of his being a local man, and that no reflection whatever was intended on Messrs. Parnell & Sons.

**The Leeds Architectural Society** on Saturday afternoon last visited Halifax. The party were met at the station by Mr. John Leeming, of the firm of Leeming & Leeming, architects, &c., Halifax, and conducted over the principal parts of the town. Amongst the buildings visited were the parish church, recently restored by Mr. Scott at a cost of about 20,000*l.*; Squire Road Congregational Chapel, recently restored by Messrs. Leeming; the Higher Board School, Prescott Street, erected at a cost of about 6,000*l.*, from plans by Mr. R. Horsfall, of Halifax; Heath Grammar School, erected at a cost of about 10,000*l.* by Messrs. Leeming; Haugh Shaw Board School, also by Messrs. Leeming, and which cost about 6,800*l.* The town hall was the last building visited, when the opportunity was taken on the part of the visitors to express their thanks to Mr. Leeming. It is the intention of the Society to again visit Halifax, as many buildings were necessarily left unseen owing to the shortness of the visit.

**The Birmingham Architectural Association** made one of its periodical archaeological and sketching excursions on Saturday last. Visiting first Solihull, the party walked to Berry Hall—a charming example of a moated half-timber house; thence to Escote Hall—another larger, more elaborate, but much-restored example of half-timber work. Journeying still brought them to Wharley Hall, also of half-timbered treatment. Barston Church was next passed. It is a red-brick building, erected when architectural art—if art existed—was at its very lowest ebb, and would probably be denominated as being in the "Queen Anne" style. Leaving Barston the party came to the village of Hampton-in-Arden, and viewed the fine old church and the charming and picturesque modern cottages, after which they returned to Birmingham.

**Leek.**—On Monday the foundation-stone of the Nicholson Institute was laid. The building, which will cost in all some 20,000*l.*, will combine a free library, art gallery, museum, and school of art. The structure is being erected by Mr. Inskip, builder, from the designs of Messrs. Sugden & Son, architects, of Leek. The building is a gift to the town, and the stone was laid by Mrs. Nicholson, wife of the donor, Mr. Joshua Nicholson, head of the firm of Messrs. Brough, Nicholson & Co., silk manufacturers, the largest employers of labour in the town. The building will take two years to erect.

# The Architect.

## THE OFFICIAL CONTROL OF BAD BUILDING.

WHEN a new metropolis for the ancient world was created by CONSTANTINE out of the town of Byzantium, although all the resources of imperial revenue and the authority of despotic power were at the disposal of the builders, a good deal of their work, it is said, was so very indifferently constructed that in the succeeding reign fears were seriously

entertained lest a good deal of it should come down with a run. In the chief metropolis of modern empire the course of building proceeds so far at least on a similar footing that, if the successor of Queen VICTORIA should enjoy a lengthened reign, there is a considerable proportion of the town which may very likely in his day come tumbling about the ears of the citizens in a way to scandalise the world.

Any one who, in passing about London by some of the lines of railway which overtop the houses, feels disposed to look a little narrowly at the picture below, can scarcely fail, even if he be but a poor judge of building affairs, to be astonished. He will see a good deal of squalor, damp, smoke, and dirt; but let us suppose the weather to be at its best and none of these characteristics too prominent. He will see poverty; but let him pass over that with the customary and comfortable reflection that the poor we have always with us. He will see—and if it be pointed out to him by a fellow-traveller, perhaps, who can read beneath the surface of the scene, he will find it much more notable than he expects—an interminable wilderness of houses, the very flimsiest, as it appears to be, in brick walls and tiled or slated roofs, that human ingenuity can well contrive to set up so as to stand for a time and not instantly collapse. Let the observer go even into other quarters, and better; and when it is no longer the rows of dwellings of the very poor which he sees, but the neat semi-detached villas of the middle classes, and their terraces of “superior family residences,” the case is often very much the same, and the fractured walls, after an existence of what is obviously only a very few years, too often tell the tale of decrepitude as plainly as in the worst parts of the town. Why, he will ask, should this be so? Can it be the interest of men of business to build houses which are so palpably unsubstantial? And, if it can be so, is there no officer to control such building in the interest of the public?

To these two questions the answers are, so to speak, simple enough and yet not so simple. As a financial principle, we may reply, it is assuredly not to the interest of the builders to build so badly as many of them—we ought, perhaps, to say most of them—are so prone to do. But if they will persist in so doing, there is, we may add, in this free country no constituted authority by means of which they can be prevented. These are the simple answers. But we may with equal accuracy reply in another sense, it unfortunately is the fact, and cannot be disguised, that a certain kind of self-interest, arising out of a perversion of financial policy in desperate circumstances, does compel builders, by the sheer force of necessity that knows no law, to scamp their work to the uttermost; but we may go on to add, with regard to the question of control, that a kind of authority appears at this moment to be gradually springing up, by means of which it is to be hoped, and indeed expected, that a very considerable improvement in the quality of the lower modes of building will in course of time be brought about compulsorily.

On the financial point a very little explanation may suffice, inasmuch as the circumstances are notorious. When a speculation builder—who of course is the house-manufacturer of every-day business—happens to possess both capital and brains sufficient for carrying on his operations confidently, respectably, and therefore somewhat liberally, he recognises clearly enough the force of the maxim of trade, that a good article alone can command a permanent market and produce reliable profits. Accordingly, he will be found to build, if not always thoroughly well, at least very much better than many others. But when these others are questioned, and the details

of their transactions laid open—perhaps in the Bankruptcy Court—it is found that they have occasionally a little money and no brains, but more generally a little brains and no money. In the latter case especially they are in reality very poor struggling men, whose only means of getting what is almost literally daily bread is to keep their work constantly going—going anyhow—and to squeeze what they can out of it by splitting halfpence. Such men have no commercial character to keep them upright—like BENJAMIN FRANKLIN'S empty bags, they find it hard, perhaps impossible, to stand erect at all; and if they can by any means satisfy the solicitor who lets them the land and finds them the money (whose personal policy it is to be easily satisfied), and can contrive, with his help, to sell somehow or other, and almost at any price, in time to keep accounts running, they allow the virtues to look after themselves, and are content to live. Such operators necessarily produce very bad building as a rule; and, what is worse, they in a great measure determine, owing to their numbers, the general tone of the philosophy of speculation building throughout the town. We are glad to hope that their example is being more frequently disregarded now than it used to be, and that even in their own persons some of them are venturing out of the old line into a course that is better in the end for all concerned; but the fact remains, that they have in years past covered miles of good metropolitan land with mere rubbish of building, and we cannot help adding that they are still covering other miles in the same way.

It is for such reckless practitioners as these that building regulations are primarily made part of the law of the country; and hence arise such statutes as the Metropolitan Building Acts, which have been in force for a great many years. It is well known that there are some sixty experienced architects employed in the daily work of administering the provisions of these Acts in London, under the name of district surveyors; and, judging by the fact that they receive in the aggregate thirty or forty thousand pounds a year for their services, besides incurring a large amount of odium, they ought to have a good deal to show for the money. All depends, however, obviously enough, upon what it is that the Acts enjoin or authorise them to do.

Now any one who appreciates aright the policy of English law when directed to the restraining of private business will perceive at a glance that the only standard which the Building Act can really profess to set up in this country is what may be called a minimum of stability; and, accordingly, it is well understood that the metropolitan building regulations represent in effect the lowest scale of substantiality that is safe for occupants and passers-by—we might otherwise call it the utmost degree of unsubstantiality that the people at large can be advised to tolerate, even when making as little fuss as possible about their own life and limb. When we observe that a brick wall 9 inches in thickness in an ordinary dwelling-house is actually allowed to extend to the limits of 30 feet in length and 25 feet in height, most of us will admit that this indicates a sufficiently low standard of stability to satisfy the most benevolent philosophy; and when we take the responsibility of adding that such a wall has often, very often, been built of bricks little better than dust, with mortar little better than mud, the reader may be as indignant, or not, as he pleases. Then as regards other matters, such as the adequacy of the strength of timber-work in floors and roofs, we may simply explain that there are absolutely no legal regulations at all to restrict the exercise of economy.

It is unnecessary to repeat the suggestion that houses of the kind which we thus indicate are not likely to stand long; and if the reader should begin to reckon up the vast number of such houses that have been built in London within the last fifty years or so, the very awkward conclusion will be forced upon him that a considerable proportion of the newer or younger parts of the town must already be looked at as dangerous. This, however, we will allow to pass, in order to inquire whether the power of the law is coming in any way to be of more avail against the perpetuation of such a state of things.

We are glad to think it is. In England the law may be said to have a happy knack of adapting itself to the growth of intelligence. Without altering the statute, public opinion seems to cause its interpretation to be altered; and this process, we think, is at the present moment going on with reference to building law. Some of the district surveyors, beginning to perceive that they ought to be guided by

considerations of public progress and public complaint, are said to be a good deal more "strict" than they or their predecessors used to be; and we regard this as a commendable circumstance. In fact, building law is so difficult to the lawyers at any time, that, if official architects will be firm, and of course conscientiously so, in an endeavour to make common sense of it rather than technicality, the legal authorities to whom an appeal may lie will always be found disposed to support such a policy; and it may certainly be affirmed without danger of contradiction that, however much the genius of English legislation may hesitate to interfere with private business, the intention of the Legislature in matters of this kind could not possibly be to encourage bad building, or in any way to sanction such building as will in fifty years become dangerous. Accordingly we will go so far as to recommend the public officers to be even more strict than they are in requiring honest and sound construction, whether (so to put the case) there be law for it or not. It is a disgrace to all England to see such work as is common in London, and it cannot be doubted for a moment that the intention of Parliament is to put a stop to it, and has always been so upon every occasion when the question has come under discussion.

One argument that may be allowed much weight is that coroners' juries have been found to be very unwilling to exonerate public surveyors—or even private surveyors, as witness a recent case—from what they regard as the responsibility to common sense distinguished from statute law. What we deduce from this consideration is that public opinion is in advance of the letter of the law; and if, as we have said above, the progress of public opinion constitutes the spirit of the law, then the public surveyor should stretch his authority in the interest of sound building as not only his duty but as his interest. Nor must he flinch at the odium; a surveyor or supervisor of any kind who does his duty manfully must not expect to be a popular favourite; and, if the speculation building of London is to be improved, this certainly cannot be accomplished by amiable concessions to the private interests of offenders.

It is especially worthy of remark that the building regulations which are now being established in provincial towns and districts under the Local Management Acts are being administered in many cases with a vigour which is unknown in the metropolis. No doubt there is an outcry occasionally, but that cannot be helped; and what we venture to say, in view of the shameful state of common London building, is that the Legislature and the better classes of the public would not be sorry to see the same outcry raised in many quarters of the metropolis also.

## WATTEAU.—II.

(Concluded from page 170.)

THE marvellous rapidity with which WATTEAU composed was almost a matter of regret to his friends. Once the idea of a picture occurred to him, he was nervous and impatient until he had put it on canvas. It was this impatience which led him to the unsparing use of some materials which GERSAINT, DE CAYLUS, and MARIETTE are unanimous in deploring. They attribute to it the fact that some of his charming paintings had already lost even in their day much of the brilliancy of their tone. It is remarkable that WATTEAU took greater delight in drawing than in painting, perhaps because by means of his pencil, pen, or crayon, he expressed his conception more rapidly on his favourite *papier chamois* than by means of his brush on canvas. Once a crayon was in his hand it was only by an effort he returned to his easel. His sketches were chiefly executed in red crayon, a vehicle he specially affected, partly because with it he easily obtained the reverse of his design, and partly because of the warmth of its tone. He used a "sanguine" which cannot be procured in these days, and as he heightened it with touches in black and grey, its tone assumes almost the richness of carmine. M. DE GONCOURT believes that he procured his supply of red crayon from England. A box of it was sold at a fabulous price at the auction of the painter VENEVAULT. There is a drawing, or rather a series of sketches, by WATTEAU on a single sheet of chamois paper, in the Galerie des Dessins at the Louvre (No. 1326), in sanguine, which conveys an idea of his marvellous power of giving expression by a few touches. There is the head of a woman wearing a *toque* behind that of a young man; on the left a girl's face seen in profile, and other heads par-

tially turned away from the spectator, each a mere outline, but expressing the individual characteristics of each personage as clearly as their portraits in oil could do. Near this is another drawing, in which one recognises four sketches for the single figure of *L'Indifférent*—a *chef-d'œuvre*, to be found on the wall to the right of the Las Cases Gallery in the Louvre. The sketches prove how difficult WATTEAU was to please in the pose or attitude of his figures. In the finished picture *L'Indifférent* is a young man standing in the midst of a charming landscape in an attitude which betokens irresolution. In his three-cornered hat is a freshly-blown rose, his short cloak is of a bluish-green tint, the lining being pink, his long waistcoat and hose are blue, the rose tint is repeated in the colouring of his stockings and shoes. Behind him is one of those "distances" of indescribable and mysterious loveliness WATTEAU alone could paint. The companion picture, a beauty in white satin, is chiefly remarkable for the marvellous *plis cassés* into which the satin breaks, and for the solidity with which it is painted. These are gems on a small scale. The most important of WATTEAU's works at the Louvre is, however, the *Embarquement de Cythère*, so well known by engravings it is superfluous to do more than allude to it as being one of the creations of WATTEAU's genius in which the poetic dreaminess he threw into a background is best manifested. It was painted for his *pièce de réception* at the Academy. WATTEAU was received, five years after his admission as Associate—that is, in August 1717, the delay in his reception as member having been caused by his procrastination in finishing the diploma picture.

WATTEAU did not possess the quality which is called in-habitiveness by the phrenologists. His restless nature could not long endure the same habitation. Against M. CROZAT's wish, he quitted his generous patron, and went from a sumptuous mansion to reside with his friend M. VLEUGHEL, an artist who was subsequently director of the French Academy at Rome. DE LORANGÈRE attributes WATTEAU's leaving M. CROZAT to independence of spirit and love of liberty. It is certain that he never remained long in any place, and was as little satisfied either with his surroundings as with his own works. M. DE JULLIENNE says he was *atrabilaire* in temperament, which is probably the best definition of his irritable and peculiar nature. M. DE CAYLUS deplored this temperament, inasmuch as it incapacitated WATTEAU from enjoying much present comfort and deprived him of confidence in his future career; it likewise made him the dupe of intriguing speculators. In the midst of his splendid success he was miserable, although he had more commissions than he could execute, and his wealthy patrons overwhelmed him with kindness.

In one of his letters to M. DE JULLIENNE he thanks him for a present of venison, and announces that he dispatches that morning the picture ordered for the dining-room; he hopes the wild boar and the fox in the foreground will please M. DE JULLIENNE, as he confesses the general effect of the work had given him satisfaction. It appears that WATTEAU commenced the picture on a canvas which proved too small for the space on the wall the picture was intended to fill; GERSAINT sent a man to add a piece of canvas on the right, and the vamping was so cleverly done that WATTEAU was enabled to introduce a group of horses, trees, &c., much to his own satisfaction. In another letter WATTEAU announces to his friend M. DE JULLIENNE that the Abbé DE NOIRTERRE had made him a truly regal gift, a work by RUBENS, in which were angels' heads behind a cloud, and beneath, a woman absorbed in meditation. "Nothing," he writes, "could have made him happier;" since he received this picture he could not remain a moment quietly at his easel; he had placed it above a reading-desk, as it were on an altar, and believes that RUBENS never executed finer work.

In 1719 WATTEAU was persuaded to visit England, a step from which his friends vainly tried to dissuade him. GERSAINT, who was personally attached to him, states that up to this period WATTEAU had shown an utter indifference to money, but that he suddenly appeared anxious to undertake the journey for the purpose of acquiring an independence.

In the Bibliothèque Nationale there is a curious engraving drawn by WATTEAU in London, but engraved several years after his death by ARTHUR POUND, in 1739. The subject is the portrait of Dr. MISAUBIN. A foot-note by MARIETTE states that the doctor had been a French refugee. The portrait is evidently a satire. The man was a quack, who professed to sell a remedy for every disease, and he has been introduced as

such by HOGARTH into one of the scenes of the *Mariage à la Mode* series. WATTEAU had probably consulted him, and in revenge for the failure of the medicines drew this caricature. The artist was much sought after in England, and his works executed during the ten months he resided here were liberally paid for; but the fogs were insupportable to the lover of luminous skies and sunny atmosphere. During his absence he had requested M. DE JULLIENNE to have an inventory made of his property and to have an auction thereof. The result of the sale was the modest sum of 3,000 francs (120*l.*), which would now be readily given for one of his pencil sketches. His poverty is not surprising when one reads the following receipt in his writing for a large picture containing eight figures:—

J'ay reçu de Monseigneur le Duc D'ORLÉANS 260 livres (francs) pour un tableau qui représente un jardin avec 8 figures. Fajt à Paris le 14 Août, 1719. ANTOINE WATTEAU.

This receipt is in the possession of Baron DE ROTHSCHILD. He returned from England completely broken in health, but glad to see his friends. GERSAINT, who had been his steady patron, asked him to draw something he might retain. WATTEAU replied, "I will paint a signboard for you." The result was the picture of world-wide celebrity, in which we have the interior of GERSAINT's shop. In the foreground on the right is a lady in hoop and *sacque*, to whom GERSAINT, standing on the far side of the counter, on which the lady leans, shows a picture. With her right hand she flirts a fan. In the centre foreground are two figures. The one on the right is that of a young girl, whose *sacque* of rose satin falls in folds of marvellous gracefulness, catching a gleam of sunshine from the open door; a knot of rose ribbon fastens her hair. A young beau, attired in a chocolate-coloured suit and ample wig, wishes to lead her towards a picture in the background; on the extreme left men are unpacking paintings from a case. There is an engraving of this well-known work in the *Hôtel Carnavalet*. It is hung in the room which was once Madame DE SEVIGNÉ's boudoir.

PATER copied *L'Enseigne de Gersaint*, but reversed the subject. The copy PATER made of it was exhibited at the Arts Décoratifs in 1880. It is the property of the picture-dealer M. PETIT, who refused 1,000*l.* for it. After he returned from London WATTEAU lived in obscure lodgings he had asked GERSAINT to find for him, strictly forbidding GERSAINT to divulge his place of abode. The signboard—as WATTEAU was pleased to call his picture—finished, he became so seriously ill that he feared to inconvenience GERSAINT, who had insisted on his removing from the poor lodgings to his house. GERSAINT struggled unsuccessfully against his restless wish for change. WATTEAU became impatient, and was only tranquillised when GERSAINT informed him that his friend M. LE FÉORE, Intendant des Menus Plaisirs du Roy, had placed his house at Nogent at his disposal. WATTEAU was labouring under mental depression as well as physical illness. To M. DE JULLIENNE he made a remark which expresses this: "Le pis aller n'est pas l'hôpital, on n'y refuse personne." A presentiment of his early death must have come over him at Nogent, for he sent for PATER, who some years before had begged of him some instruction which WATTEAU had refused. He desired PATER to stay with him at Nogent in order that he might give him the benefit of his advice. PATER for months daily painted under the eye of the dying man, who spared no trouble in the effort he made to impart the secret of his success to the younger artist. PATER constantly referred to this with gratitude, and confessed that all he knew had been acquired at this period from WATTEAU.

His friends surrounded him with attentions he received gratefully. No expense was spared by them to procure for him the best advice Paris could supply. The curate of Nogent paid him several visits. On one occasion he brought him a crucifix. On seeing it WATTEAU exclaimed, "Is it possible that any one could have thus caricatured my Master?" and immediately commenced a painting of CHRIST on the Cross as a gift to the good curate. The Comte DE CAYLUS remarks that although this work was by no means worthy of his genius, the countenance expressed the suffering the dying artist experienced himself. He expired July 18, 1721, at the age of thirty-seven.

ANTOINE WATTEAU executed in aquaforte *Les habits sont Italiens*, of which M. DE GONCOURT possesses the only copy extant; *The Recruit going to join his Regiment*, and seven *figures de mode*. He painted three portraits of himself,

which have been engraved by LÉPICIE and BOUCHER; as also of ROSALBA CARRERA and of VLEUGHEL, and portraits of M. DE JULLIENNE and himself conversing in a park, entitled *Conversation*. COCHIN engraved six of the scenes of military and of theatrical life; AUDRAN two mythological subjects and fourteen pastoral scenes; AVELINE eight; the Comte DE CAYLUS seventy single figures and several rustic subjects. *Le Lorgneur*, by TARDIEU; the *Fêtes Venétiennes*, by CARS; *L'Île Enchantée*, by LEBAS; *La Sérénade Italienne*, by SCOTIN, &c., are among the best known of the 481 of WATTEAU's engraved works, and 350 etchings have been reproduced of *Figures de Différents Caractères*. Besides these are a large number of unsigned engravings of other pictures, of which library of preserved in the Bibliothèque Nationale and in the copies are the Arsenal.

### THE ACCIDENT AT ST. PATRICK'S CATHEDRAL, DUBLIN.

THE accident which happened in Dublin a few days ago, through the fall of a buttress of St. Patrick's Cathedral, calls for a few remarks, although some of the circumstances of the case have yet to be explained. St. Patrick's is one of the two cathedrals possessed by Dublin, and which have been restored at the cost of manufacturers of intoxicating drink. It is a large Gothic structure, with a high steeple that is comparatively modern, and in the opinion of many of the inhabitants of Dublin is the most remarkable part of the building. SWIFT was Dean of St. Patrick's in the early part of last century, or, to use his own words, was "absolute lord of the greatest cathedral in the kingdom." The cathedral revenues were husbanded by SWIFT, but in later times they were barely sufficient to meet the expenses. There were no funds available for repairs, and the building was gradually falling into ruin. When the late Dean PAKENHAM was appointed he resolved to appropriate a part of his income to pay for works, and for several years a few men were to be seen pottering about the cathedral. The way in which the repairs were carried on would gladden the hearts of the opponents of restoration. There was no system, for no architect was allowed to prepare a plan dealing with the cathedral as a whole. The patching of the building was, in fact, one of those desirable jobs which builders are eager to secure, as they allow of the utilisation of spare days. Under such circumstances it would be vain to expect that substantial work was to be executed. Dean PAKENHAM appeared to be the only man who had an interest in the condition of the building, and it was not difficult to satisfy him. The workmen understood the state of affairs, and they might be trusted to make light of their responsibility. After a time Mr. GUINNESS, a wealthy brewer, offered to take charge of the restoration of St. Patrick's, and the Dean was glad to hand over the cathedral to him to be operated on. A wholesale renovation was at once undertaken, the extent of it being left to the discretion of Mr. GUINNESS' builder. The sum expended was so large as to be without precedent in Ireland, or even in England; but, inasmuch as there were no architects' fees, everybody concerned was no doubt satisfied. It would be strange if the fortunate contractor were otherwise.

The Cathedral of St. Patrick's thus became not only an illustration of the munificence of a citizen of Dublin, but a striking example of the success of the policy of dispensing with an architect. It might long have continued to be distinguished on those accounts but for the catastrophe of last week, the origin of which may now be described. The site of the building is at a low level; near it runs a dirty stream called the Poddle, and which is a sort of Fleet Ditch. The lower part of the cathedral was of late years periodically flooded, and at length the authorities were compelled to undertake works for the drainage and security of the foundations. The works consisted of the underpinning of the walls and buttresses, the laying down of a tile floor, and the construction of an engine-house in connection with the hot-water apparatus. The old precedents appear to have been disregarded, for the works were under the superintendence of an architect.

The underpinning of the buttresses was commenced last week. A trench was opened near the north wall, and was excavated a few feet under the foundations. The first buttress that was underpinned is the one which collapsed, killing in its fall a woman and two boys. It was about 70 feet high, 4 feet wide, and projected 7 feet from the body of the church. As

the underpinning was supposed to be simple and likely to be completed in a short time, it was not supposed that any shoring of the buttress was necessary. The foreman mason, in describing what was done, said to the coroner and jury that "he took a foot and a half down, a foot and a half at the right, and a foot and a half at the left, and that he pinned up each portion of it before he commenced another." It is possible that the material beneath the buttress was barely sufficient to carry a mass of masonry of which the weight has been calculated to be more than 90 tons, but when a part of the foundation was removed the remainder was overweighted. The remarkable part of the case is that the whole weight came upon the foundation. The buttress was, in fact, stuck on the wall without being tailed in or tied throughout its entire length, and consequently there was nothing to take the load off the ground. It is easy to imagine what followed. A space between the buttress and the wall became evident, but it is needless to say the foreman did not apprehend danger, and nothing was done to prevent an accident. In the middle of the day the buttress fell suddenly in a mass which was not broken until the railings and ground were struck. The street adjoining the cathedral is rather wide, otherwise there would have been damage to some of the houses.

The buttress, which was constructed in so peculiar a way, would seem to be the work of the builder who was employed in 1845 by Dean PAKENHAM. It is precisely the kind of make-believe that might be expected when work is allowed to be carried on without the superintendence of an architect, and a scrutiny of the building would probably reveal many other examples of defective masonry. The main cause of the accident consequently does not arise from negligence on the part of those who now have charge of the cathedral. It might have been possible to preserve the buttress if the architect and builder were aware that the buttress was practically detached from the wall, but it was not unreasonable to assume that a compact mass of masonry could stand for a few hours, if partially supported.

### THE DAWSON MEMORIAL, BIRMINGHAM.

A MEETING of the subscribers to the George Dawson Public Memorial Fund was held in Birmingham on Tuesday evening. The report from the executive committee was read. It stated that a bust of Mr. Dawson by Mr. Williamson was finished and placed in the Church of the Saviour on August 8 last. Two members of the General Committee, on their own responsibility, saw Mr. Woolner as to his preparing another model for a marble statue. In answer to a letter lately addressed to him on the subject, he intimates that he cannot satisfactorily do this without definite instructions as to mode of treatment. Meanwhile, and early in August last, the fact that the statue had been injured was made public. The damage to the statue has rendered it useless to further propose or to discuss any alteration to the statue or any change in its position. It is evident that this part of the memorial must now be begun over again. Mr. Thomas Barnsley was communicated with, to ascertain what he was prepared to do in the matter. In order that his offer may be fairly judged, it should be here stated that the amount of Messrs. Barnsley's bill for the erection of the canopy, exclusive of the carving, which was done by Mr. Barfield, was 485*l*. Mr. T. Barnsley has offered to subscribe towards a new statue the sum of 250*l*. There is in the bank a balance of the old subscriptions amounting to 250*l*, and the subscriptions to a marble statue reported at the last meeting amount to 186*l*. 14*s*.; total 686*l*. 14*s*. The estimate for a new statue already mentioned to the subscribers is 800*l*. The executive committee has therefore subscribed the balance requisite to make up the 800*l*, and that sum is now at the service of the successors of the present executive committee. The present committee now resigns its position, and it is for the subscribers to elect a new committee, and thereafter take such steps as they may think desirable.

The report of the committee was adopted.

Mr. J. H. Chamberlain asked the meeting to allow him to propose that they should pay a vote of thanks to Mr. Thomas Barnsley for his very handsome contribution to the fund. Mr. Barnsley was entirely ignorant of the accident which had happened. It was a pure accident, and happened in a very curious way. The statue was sent down from London in a long box, the top of which was fastened by various bolts and screws to the sides and bottom. This was taken away, and the statue was hoisted to its place. Then the box, with the exception of the front, was left round the statue for the purpose of protecting it. Ultimately, when the box came to be moved for the purpose of veiling the statue, the workmen, in drawing the box away, did not notice a large bolt projecting in the inside, and which struck the figure exactly upon the nose. He dared say a great deal of consternation followed. Upon the recent discovery of the damage the committee were in a great difficulty,

because Mr. Barnsley had undertaken to fix the statue, not as part of the contract for the canopy, but at the request of the committee. Mr. Barnsley, however, had raised no legal question or difficulty of any kind. He had put himself at once in Mr. Johnson's hands, stating that he did not want to look at the question from a legal point of view or to discuss the question of responsibility, but he wished to relieve the committee from the very great difficulty that he felt they were in. Although this was a personal loss to Mr. Barnsley, his conduct in the matter did not surprise him (Mr. Chamberlain), for he had had the pleasure of knowing Mr. Barnsley in business for the greater part of thirty years, and he had only acted in this case as he had acted in others. He thought that all present would agree that Mr. Barnsley's liberality was great, as his conduct had been nothing less than noble. He moved "That the hearty thanks of the subscribers to the Dawson Memorial be given to Mr. Thomas Barnsley for his handsome donation towards the new statue."

Mr. G. J. Johnson, in seconding the resolution, said that Mr. Barnsley had left the settling of the amount he should pay in the hands of Mr. Chamberlain and himself. Mr. Barnsley concluded his last letter by the words—"I do this because I value my friends more than the money." Mr. Barnsley's action had relieved the committee from a very serious difficulty in which they would have been placed had Mr. Barnsley treated the matter in a narrow or technical spirit. They would all agree that Mr. Barnsley was deserving of their most hearty thanks.

The resolution was unanimously carried, and an executive committee was afterwards elected.

Mr. Leadbetter moved that Mr. T. J. Williamson should be commissioned to execute a statue in marble at a cost of 800 guineas.

Mr. Basnett seconded the motion.

Mr. T. F. Walker said he should prefer commissioning Mr. Williamson for a model, and he felt that if they spent the whole 800 guineas upon a series of models, and got a satisfactory one ultimately, there would be no difficulty in obtaining the money for carrying it out in marble. He believed that he himself could raise the money within a month. If the model was a success they could go on with the statue; but if it was a failure he should regret it, whether by Mr. Williamson, Mr. Woolner, or anyone else.

Mr. Leadbetter said his intention was that the sculptor should be commissioned for a model.

Mr. J. S. Manton said it was so desirable that there should be no mistake this time, that he would second Mr. Walker's resolution that the executive should obtain a model or models from one or more sculptors as in their wisdom they might think fit.

Mr. Walker said the last speaker had somewhat misunderstood his amendment. He thought the feeling of the subscribers was so much in favour of Mr. Williamson that they would desire him to produce a model first.

Mr. Manton entirely agreed with Mr. Walker, only he was anxious not to tie the hands of the committee to one sculptor.

Mr. J. H. Chamberlain said he should like to ask gentlemen present as to what they meant by a model. In the case of a model for a bust, it was usually made about the size of the bust itself, as was done by Mr. Williamson for the bust at the Church of the Saviour; but the model for a statue was usually only a small work—about 2 feet 6 inches high. There was very much greater difficulty in judging of a statue from a small model than from a large one; but, on the other hand, to get a model the size of the proposed statue would involve a considerable expense.

Mr. Shammon suggested whether it would not be desirable to have a full-size model, and have it placed in position under the canopy.

The Chairman said he was afraid it was impossible to convey a large work in clay a long distance and place it under the canopy.

Mr. A. W. Wills said that no sculptor of repute would undertake to submit a model six or nine feet high. A sketch model would show the general treatment proposed of the figure and drapery, and if it was not exactly what was desired it should be altered; while as to Mr. Williamson's skill in producing a successful posthumous likeness it was amply shown by his bust of Mr. Dawson, his statue of Priestley, that of Dean Milman, and other works with which some in that room were acquainted. He was strongly in favour of commissioning Mr. Williamson to submit the usual sketch model or models. In the case of the Priestley statue he said two models were submitted.

Mr. Mann thought that an invitation to submit a model would be bringing Mr. Williamson into a kind of competition, and he should prefer giving him the commission for the statue at once.

Mr. J. S. Manton said that in the case of the bust of the Church of the Saviour a model was invited from Mr. Williamson, and he submitted one without objection, well knowing that if it was not approved the marble bust would not be ordered.

Mr. Chamberlain asked whether that was what they wished in the present instance? If the model was not satisfactory, and they did not order the statue, he supposed they would be willing to pay for the model in any case.

After some further discussion the resolution was amended as follows:—"That it be an instruction to the executive committee to commission Mr. Williamson to prepare a small model or models

for a statue, and that they submit the same to the inspection of the subscribers."

Mr. J. H. Chamberlain said he understood the resolution to mean that Mr. Williamson should prepare a model; he also understood that if that model was not satisfactory, and Mr. Williamson wished it, he should be at liberty to make another, and, if necessary, a series. Speaking on behalf of himself and his friends around him, he (Mr. Chamberlain) could say that all they wanted to do was to produce a satisfactory model of Mr. Dawson, and one that should be consonant with the wishes of the subscribers.

The resolution was then carried unanimously.

### CAIRO.

THE following account of Cairo, from the French of M. Isambert, will have exceptional interest at the present time:—

Gewher, the general of the Fatimite Sultans of Maghreb, after having conquered Egypt in the name of his master, El Moezz, in the year of the Hegira 358 (969 of the Christian era) commenced the erection, a little below the Arab town of Fostat, and at a short distance east of the Nile, of a new city, which, in commemoration of his conquest, he called El Kahira, "the Victorious," a word which Europeans have corrupted into Cairo. Since the year 973, when the Fatimites adopted this town as their residence, it has been regarded as the capital of Egypt. The Arabs even gave it the name of Egypt, Masr, calling the ancient Fostat "Masr-el-Atikah" (Old Masr), or, as the Europeans say, Old Cairo. The oldest part of the town, built by Gewher, in which is situated the mosque of El Azhar, was that which they now call El Kasrein, "the two palaces," of which one, inhabited in the twelfth century by Saladin, was afterwards a long time occupied by the court of the Cadi. It is a little distance north of El Azhar. This primitive part of the town is also called Medineh, just as in Europe the name "city" is frequently used for the most ancient quarter of a large town. The establishment of the Fatimite dynasty opened for Egypt a new era in architecture. Until then the country had been governed by deputies of the caliphs of Damascus or of Bagdad, whose solicitude for the inhabitants of Egypt, whence they derived a great part of their revenue, never went so far as to build or to adorn a great capital, which might prejudice their own residence. The Fatimite caliph Hakim-bi-amr-illah, although in a moment of madness he one day set fire to Cairo, contributed numerous buildings to the embellishment of the town, among them the mosque which bears his name (Gama-el-Hakim). When, at the fall of the Fatimite caliphs, the Abbassids, reigning at Bagdad, became supreme, Cairo still continued to remain the seat of powerful dynasties, which succeeded one another from the year 1176 until the conquest of Egypt by Selim I. Salah-Eddin-Youcouf, so well known under the name of Saladin, the founder of the Ayoubite dynasty, substituted in 1176 for the brick walls with which its founder had encircled the town a stone enceinte, while at the same time he constructed the citadel and considerably extended the town towards the south. It was also during the reign of Saladin that Christian merchants were first allowed to settle in Cairo, and to form the Frank quarter called El Mouski. "The succession of these dynasties," says M. Pascal Coste, "gave birth in each period to palaces in which the vanity of each Prince sought to surpass his predecessors. Strangers were received in audience and the judgments and decisions of the Sultan were delivered with infinite ceremony. Vast halls and pillared porticoes were built, where the Prince on the throne, his Ministers, the officers of his court, the scholars whom he patronised, and, in short, all sorts and conditions of men, took their places, every man according to his rank. This arrangement of palaces, unknown to the countries of Europe, would seem from the indications furnished by ancient monuments now in ruins to have been a peculiar feature of the courts of the Persian monarchs. Many Arabic words describing this luxurious architecture are evidently borrowed from the Persian language, and it is remarkable that when the poets wish to describe the solidity, the magnificence, and the grandeur of building porticos, or halls of audience, the courts and the porticos of the Chosroes are always cited as models." It was under these independent dynasties that luxury made its way into Egypt. Colleges were created with libraries, where all the princes, Abbassids or Fatimites, Ayoubites, and Mamelukes, felt it an honour to hold receptions. One of the Mameluke Princes, Sultan Bibars, was distinguished for the numerous buildings with which he endowed Egypt and Cairo. He repaired the mosque of El Azhar, and the great tower of the citadel, which was falling into decay, and founded colleges and mosques at Cairo. The succession to the throne, in 682 of the Hegira, of Sultan Kalaoun marked an epoch rich in great monuments. A mosque bearing his name still exists. Melek-en-Nacer, his son, followed the traditions of his father, "It seemed," said the historian, "as though the order had gone forth to build; emirs, soldiers, ministers, even ordinary inhabitants of Cairo vied with one another under this Circassian dynasty in the splendour of their dwellings. Among these princes may be further cited the Sultan Barkuk and Kait Bey, whose names are still borne by remarkable buildings in Cairo. During these reigns, towards the end of the seventh

century of the Hegira, the art of architectural decoration attained the highest degree of magnificence and perfection. The cemeteries of Cairo have preserved from this period many buildings which are models of elegance. The stone aqueduct which brings the water of the Nile to the citadel was constructed in 1500 A.D., in the reign of El Ghouri. There is nothing noteworthy in the history of the Egyptian capital during the centuries which followed until the epoch of the French expedition. The Battle of the Pyramids was followed by the entry of the French army into Cairo on July 22, 1798. There is no need to recall the flatteries with which Bonaparte tried to gain the Sheikhs and the Imaams, and to gain the attachment of the population of Cairo. The insurrection of October 21 soon showed how unreal was their submission, and the revolt was drowned in blood. But the absence of the commander-in-chief during his mad expedition to Syria compromised the new colony, which was to be shortly left in the lurch by Bonaparte's departure for Europe. Kleber, who succeeded to the command, was assassinated by a fanatic in the Ezbekeeyah Gardens. Under Mehemet Ali and his successors Europeans have exercised a preponderating influence in Egypt, and from their point of view the progress of the country has been considerable. The reforms of the last few years have perhaps gone too far in applying to the city of Cairo the system of clearing everything to open out wide streets, and of building houses in the European style. The city is thus more and more losing its Oriental air. In all the western part of the city this "Hausmannisation" has been hurriedly pushed on without sufficient regard for artistic feelings; as though the intention were to make Cairo into an *auberge du monde*, where the indolent could spend their money and dissipate their *ennui* amid pleasures purely material. A nobler destiny might be dreamed of for this splendid capital, where the art of the Pharaohs and the Arabs unite with luxuriant Nature to transport our thoughts into the highest regions of the ideal.

### THE LATE MR. W. B. C. FYFE.

ON the 15th inst. Mr. William Fyfe, who was one of the best known of the Scottish artists in London, died suddenly at his residence in Abbey Road, St. John's Wood.

Born at Dundee, and brought up at the neighbouring village of Carnoustie, in a household of the old Scotch school, where the artist's profession was ranked as something certainly less than respectable, Mr. Fyfe encountered no small opposition in his artistic aspirations; but more discerning friends than those immediately around him interested themselves in him, and he became at the early age of fifteen a student of the Royal Scottish Academy. After three years' study in Edinburgh, during which time the tender grace of his crayon portraits attracted special notice from the President, Sir George Harvey, &c., and also won him Academy prizes, he proceeded to Paris, where he lived during 1857 and 1858.

In 1862 he returned to the Continent, and a year of busy work was spent in the art galleries of France, Italy, and Belgium. In 1863 he settled in London, at the same time as his warm admirer and friend, John Faed, R.S.A. A busy period followed, in which portraiture was varied with landscape and *genre* pictures. A Covenanted subject, *The Death of John Brown of Priesthill*, attracted much notice; while the result of summers spent in Scotland was seen alike in his picture *Jeanie Deans and the Laird o' Dumbiedykes*, and in the collection of a series of studies of Scotch interiors. The years 1868 and 1869 produced a list of *genre* pictures of merit and interest, *The Wood Merchant*, *The "Scotsman," Sir? The Flower Girl*, *The Orange Girl*, *Marketing*, and *A Girl of the Period*, the last-mentioned work being made familiar to all lovers of pictures by exhibition in both the English and Scottish Academies, and in art exhibitions all over the country. The next four years, the most active period of the artist's career, brought *The Young Cavalier*, *On Household Cares Intent*, *The Page*, *The Maid of Honour*, *Bide a Wee*, and *What can a Young Lassie dæ wi' an Auld Man?* His best-known works of recent years were *A Good Catholic*, *Wandering Minstrels*, *The Love-Letter*, *A Quiet Christmas*, *The Fisherman's Daughter*, *A Chelsea Pensioner*, and the most important of Mr. Fyfe's historical pictures, *The Raid of Ruthven*. Among Mr. Fyfe's portraits a few of the most important are those of Lord and Lady Dufferin, Admiral Grenfell, Mr. Alderman M'Arthur, M.P.; Sir William Anderson Ogg, Sheriff of London and Middlesex; Dr. Lorimer, First Principal of the London Presbyterian College; John Faed, R.S.A.; Mr. C. E. Lewis, M.P.; the late Sir David and Lady Baxter; Mr. G. B. Bruce, the eminent engineer; the late Mr. Pontifex, Master of the Armourers' and Braziers' Company; and Mr. R. H. Giraud, Deputy Governor of the French Protestant Hospital. His last works are a charmingly simple yet graceful fancy picture, *Hide and Seek*, and *A Fisher Girl*, both at Nottingham Castle; and *A Portrait of the Artist*, which has been lent to the forthcoming Dundee Exhibition. On his easel, but fortunately finished, is *Nellie*, an exquisite fancy portrait. The whole studio, however, is full to overflowing of interiors and studies—pictures most people would have called them—with which Mr. Fyfe, though repeatedly offered large sums, declined to part. As a collector of singular taste and skill he was well known, and he has left his walls covered with many strictly

representative works of eminent brother artists. Of the power and freshness of Mr. Fyfe's own work all who saw his pictures testified. He was a member of the Council of the City of London Society of Artists, the Savage Club, the Scottish Artists' Club, and the Hogarth Club, and was an International Exhibition gold medallist of 1873. He was in his forty-seventh year, and leaves a widow, son, and daughter.

### GLASGOW ARCHÆOLOGICAL SOCIETY.

THE members of the Glasgow Archæological Society visited Murthly and Dunkeld on the 15th inst., being the annual excursion. At Murthly Castle the visitors were received by Mr. Ainslie, representing the owner, Sir Archibald Douglas Drummond Stuart. The *Glasgow Herald* says:—There are few more melancholy sights than this castle presents. It is an enormous pile, and from a distance produces all the effect that was intended by its architect, Mr. Gillespie Graham. But as one approaches nearer it is found that the vast building is only a shell. There are walls and a roof, that is all. There is no interior—if it be not a bull to say so. No steps lead up to that entrance door which has never been opened, no rooms, no stairs are there in the whole! Sir William Stuart, to whom the Murthly estate owes so much, raised the pile, but for many a long year it has awaited completion. The grounds are extensive and beautifully laid out. The old castle, which is close to the new building, possesses so many attractions that it is matter for wonder that Sir William Stuart should have thought it necessary to undertake the erection of a new castle. The castle is of very various dates, and would be bewildering in the extreme to any stranger. The principal attraction is the tower, which is said to be more than five centuries old. It contains a room where Prince Charlie is said to have slept, and other apartments of interest. A passage on the ground floor, where local tradition affirms prisoners were kept in olden times, has attractions of its own. The collection of family portraits is interesting, but the most famous of the pictures is that of Mary Queen of Scots when as yet she knew nothing of the rude kingdom she was here to govern, and was at once the beauty and the sovereign of the French Court. This picture was purchased from the Jesuits' College in Paris. The inquiry latterly raised in one of the archæological journals as to the colour of Mary's hair receives no enlightenment from the portrait in Murthly, for the Queen's hair is close-covered.

From Murthly (or Murtly) the archæologists drove through Birnam to Dunkeld Cathedral. On the way a message was conveyed to the party that the Dowager Duchess of Athole, having heard of the intended visit, had arranged to have a guide awaiting its arrival, and accordingly the carriages drove on to the entrance to the Duchess's grounds. Thence the visitors walked to the cathedral. It is said that so early as the year 815 the then King of the Picts made Dunkeld the seat of the supreme authority of the Culdee Church, and that thirty-five years later Kenneth MacAlpin brought to the Dunkeld Church a portion of St. Columba's relics. The fame of the church spread abroad, and it was soon exposed to the pillage of the Danes. It seems probable that the lay abbots of Dunkeld were hereditary. Crinan, said to have been father of the Duncan who was slain by Macbeth, was, says Skene, a great secular chief. In 1027 Dunkeld was burnt. The history of this early time, Mr. Galloway, the Foreign Secretary of the Archæological Society, did not think it necessary to discuss in his paper, and indeed all we know is slight in the extreme. After strolling through the cathedral the party met in the part occupied as parish church, and heard a paper from Mr. Galloway on Dunkeld, in which he traced the history of the bishopric from Cormac. Altogether there were thirty-two bishops of the Dunkeld see prior to the Reformation. Matthew, the twelfth bishop, was one of the ambassadors to France for promoting a treaty of marriage between Baliol's son and the daughter of the Count of Anjou, but it is to Robert de Cardney, the nineteenth bishop, that the cathedral owes most. In 1406 Bishop de Cardney founded the nave of the church, and raised it so far as the second row of arches. In his day he had many experiences, for at one time he was a hostage for the redemption of King James I. of Scotland from the English, and at another time he had to pay for his life from a band of murdering Highlanders. James Kennedy, the twenty-first bishop, came to Dunkeld in 1438; he was a Privy Councillor, Chancellor of Scotland, and one of the Regents during the minority of James III. Bishop Ralston was also a dignitary of State as Keeper of the Privy Seal and Lord High Treasurer. He finished the nave of Dunkeld Cathedral in 1447 and began the aisles. It is said that he and friends of his of high rank were so eager about the advancement of the work that they used to carry daily several burdens of stones from the quarry—a story for which the evidence is scanty. Bishop Brown, the twenty-seventh bishop, is said to have cured a pestilence that raged in Scotland by dipping the bones of St. Columba in water, and giving the people this consecrated water to drink; he also presented many splendid gifts to the church. But of Dunkeld's bishops Gawain Douglas is without doubt the most famous. He was a son of that Earl of Angus who was called "Bell the Cat," and his two eldest

brothers, George and William, with two hundred other men of Douglas, fell at Flodden field. Gawain was born in 1474, and after having been successively Rector of Hawick and Provost of the Collegiate Church of St. Giles, Edinburgh, the Queen endeavoured to have him made Archbishop of St. Andrews. The ecclesiastical feuds, however, of the time were very bitter, and Douglas, with a spirit of moderation very rare in those days, retired from the struggle very early. The Queen, to reward him for numerous disappointments and trials, nominated him to the see of Dunkeld when it became vacant on Bishop Brown's death. Through the influence of the King of England a Papal bull was obtained in favour of Douglas, but the Earl of Athole had a nominee of his own, and again Douglas was unwillingly embroiled in a bitter Church quarrel, and was indeed imprisoned for twelve months. Ultimately he was consecrated Bishop of Dunkeld by Cardinal Beaton at Glasgow, but when he reached Dunkeld he found his rival's forces still in possession. The Regent interfered, and after a very threatening interval between his arrival and his installation Douglas prepared to settle in his new sphere. He was, however, too prominent a man to be left at Dunkeld, and only a few months after he had been installed he was selected to accompany the Duke of Albany to Paris to conclude a renewal of the ancient league between Scotland and France. A later mission to England enabled Bishop Douglas to make the acquaintance of Polydore Vergil. At last his enemies again prepared to destroy his influence. He was summoned to Rome, but before he could prepare to go the plague seized him in London, and he died there at the early age of 48. He was buried in the Savoy Church. His poetical works mark an epoch in British literature, but his great translation of the "Æneid" has of them all chiefly served to carry his name to posterity. Mr. Galloway gave an account of the varying fortunes of the cathedral and a summary of the general history of Dunkeld, with an outline of the fortunes of the Athole family.

On the motion of Bailie Wilson, Glasgow, the thanks of the society were accorded to Mr. Galloway for his learned paper.

After inspecting the great larch in the grounds, the grave of General Charles Edward Stuart, and the effigy of the "Wolf of Badenoch," the party proceeded to the Birnam Hotel, Birnam, where dinner was served.

### PATENTS FOR INVENTIONS.

THE annual report of the Commissioners of Patents for the year 1881 has just been issued. It states that the number of applications for letters patent for the year was 5,751, being 234 more than for the preceding year. The number of letters patent sealed was 3,948, of which 68 lapsed in consequence of the patentees having neglected to file final specifications in pursuance thereof, leaving 3,880 in force. Of this latter number final specifications were filed in respect of 3,621, complete specifications being filed in respect of 259. Applicants failed to seal their patents in 1,798 cases, opposition was offered in four cases, and one application stands over through the decease of the applicant. A table is given showing that about 65 per cent. of the applications for patents from 1852 to 1881 became valid patents, that of the valid patents obtained upon the applications from 1852 to 1874 nearly 30 per cent. paid the third year's stamp duty of 50%, and continued in force until the end of the seventh year, and that about 10½ per cent. paid the seventh year's stamp duty of 100%, and consequently remained in force for the full term of fourteen years. The descriptions of inventions deposited and filed in the office under the new law from October 1, 1852, when the Patent Law Amendment Act came into operation in relation to 113,379 applications for patents have been printed and published with drawings in outline. The specifications of patents under the old law from the earliest period at which specifications were enrolled, 13,561 in number, have been printed and published in like manner. The old and new law specifications amount together to 126,940. Abridgments of the specifications of patented inventions are prepared and published in classes, each confined to one subject or group of subjects, in order to facilitate the searches of inventors who are desirous of ascertaining if their inventions are novel. This series of works, which will consist of about 110 subjects, when completed to the end of the year 1876, will afford in a compact form a key to the inventions patented under each subject between the years 1617 and 1876. Thenceforward the volumes of abridgments will be published for decennial periods. Copies of the Commissioners' publications are sold at cost price at the Sale Department, 38 Cursitor Street. The receipts from the sale of these publications during the year 1881 amounted to 2,912*l.* 4*s.* 4*d.* The Patent Museum at South Kensington has been visited from its opening on June 22, 1857, to the end of the year 1881, by 5,257,000 persons. During the year 1881 there were 282,121 visitors. During the year 1881, 91 ornamental and 137 useful designs were provisionally registered, and complete registration of 15,176 ornamental and 128 useful designs was effected. There were also three designs registered for sculpture. The report is signed by the Lord Chancellor, the Master of the Rolls, and the Attorney-General and Solicitor-General.

## LIGHTNING CONDUCTORS.

A COPY of rules for the erection of lightning conductors, based upon the recently-published report of the Lightning Rod Conference, has, with the accompanying covering letter, been recently issued by the Explosives Department of the Home Office to the occupiers of all factories and magazines for explosives, and to those local and police authorities upon whom devolves the inspection of stores of explosives:—"Home Office, Whitehall, London, Sept. 1, 1882.—Sir,—The accompanying code of rules for the erection of lightning conductors has been abstracted (nearly verbatim) from the recently-published report of the Lightning Rod Conference. This Conference was assembled at the instance of the Meteorological Society, and included delegates from that body as well as from the Royal Institute of British Architects, the Society of Telegraph Engineers and of Electricians, and the Physical Society. There were also attached to it two distinguished scientific men. Permission to print and circulate this abstract has been courteously accorded by Mr. G. J. Symons, F.R.S., President of the Meteorological Society, who acted as secretary to the Conference and editor of the report. The carefully-considered opinions of such a representative body of scientific men, based upon a mass of practical as well as theoretical evidence, cannot fail to command the very attentive consideration of all persons specially interested in the subject of lightning conductors. Among those who are so interested may be specially named the occupiers of factories and magazines for explosives. On these grounds, and in view of the fact that the report as a whole may not have come under your notice or be readily accessible to you, I venture to forward a copy of these rules, and to accompany the same with the expression of a hope that you will give them the consideration to which they are entitled, and will take such steps as may seem expedient to you in regard to bringing your system of lightning conductors as far as practicable into conformity with the principles therein enumerated. These principles should, I consider, guide this Department in forming an opinion as to the efficiency, or otherwise, of the lightning conductors which may come under our official observation.—I have the honour to be, your obedient servant, V. D. MAJENDIE, Colonel, H.M. Chief Inspector of Explosives."

The following are the rules referred to in the above letter:—

1. *Material of Rod.*—Copper, weighing not less than 6 oz. per foot run, the electrical conductivity of which is not less than 90 per cent. of that of pure copper, either in the form of rod, tape, or rope of stout wires, no individual wire being less than No. 12 B. W. G. (109"). Iron may be used, but should not weigh less than 2½ lbs. per foot run.

2. *Joints.*—Every joint, besides being well cleaned and screwed, scarfed, or riveted, should be thoroughly soldered.

3. *Form of Points.*—The point of the upper terminal \* of the conductor should not have a sharper angle than 90°. A foot below the extreme point a copper ring should be screwed and soldered on to the upper terminal, in which ring should be fixed three or four sharp copper points, each about 6 inches long. It is desirable that these points should be so platinised, gilded, or nickel-plated, as to resist oxidation.

4. *Number and Height of Upper Terminals.*—The number of conductors or upper terminals required will depend upon the size of the building, the material of which it is constructed, and the comparative height above ground of the several parts. No general rule can be given for this, except that it may be assumed that the space protected by the conductor is, as a rule, a cone, the radius of whose base is equal to the height of the conductor from the ground.

5. *Curvature.*—The rod should not be bent abruptly round sharp corners. In no case should the length of a curve be more than half as long again as its chord. A hole should be drilled in string-courses or other projecting masonry, when possible, to allow the rod to pass freely through it.

6. *Insulators.*—The conductor should not be kept from the building by glass or other insulators, but attached to it by fastenings of the same metal as the conductor itself is composed of.

7. *Fixing.*—Conductors should preferentially be taken down the side of the building which is most exposed to rain. They should be held firmly, but the holdfasts should not be driven in so tightly as to pinch the conductor or prevent contraction and expansion due to change of temperature.

8. *Other Metal Work.*—All metallic spouts, gutters, iron doors, and other masses of metal about the building should be electrically connected with the conductor.

9. *Earth Connection.*—It is most desirable that, whenever possible, the lower extremity of the conductor should be buried in permanently damp soil. Hence proximity to rainwater pipes and to drains or other water is desirable. It is a very good plan to bifurcate the conductor close below the surface of the ground, and to adopt two of the following methods for securing the escape of the lightning into the earth: (1) A strip of copper tape may be led from the bottom of the rod to a gas or water main (not merely to a leaden pipe), if such exist near enough, and be soldered to it;

(2) a tape may be soldered to a sheet of copper, 3 feet by 3 feet by  $\frac{1}{16}$ -inch thick, buried in permanently wet earth and surrounded by cinders or coke; (3) many yards of copper tape may be laid in a trench filled with coke, having not less than 18 square feet of copper exposed.

10. *Protection from Theft, &c.*—In cases where there is any likelihood of the copper being stolen or injured it should be protected by being enclosed in an iron gas-pipe, reaching 10 feet (if there is room) above ground and some distance into the ground.

11. *Painting.*—Iron conductors, galvanised or not, should be painted. It is optional with copper ones.

12. *Inspection.*—When the conductor is finally fixed it should in all cases be examined and tested by a qualified person, and this should be done in the case of new buildings after all work on them is finished.

Periodical examination and testing, should opportunities offer, are also very desirable, especially when iron earth connections are employed.

## FORESTS AND CLIMATE.

A PAPER has been prepared by Dr. Schomburgk, the Director of the Botanical Gardens at Adelaide, on the influence of forests on climate. The object of the author is to prove that the destruction of forests usually has the effect of reducing the rainfall, while, on the contrary, the planting of trees broadcast over a country is one of the best methods which can be adopted for ameliorating its climate and increasing the annual fall of rain. It cannot, indeed, be proved that the climate of South Australia is altering for the worse in this respect. In fact, a comparison of the meteorological records will show that the annual average rainfall for the Colony during the past ten years has been 21.1 inches, as compared with 20.1 inches for the previous ten years. The fact is that in the agricultural districts of the Colony, and especially in those which were not originally timbered, the bringing of the land into cultivation has had the effect of slightly favouring the fall of rain. Ploughed land attracts moisture to a much greater degree than the unbroken soil. In considering the effect which the removal of forests *per se* has in altering the climate in South Australia, the only direct test that could be taken from the records issued by the Government Astronomer is the experience of the neighbourhood of Adelaide. If the time is divided which has elapsed since 1839, the year in which observations were commenced, into two periods, there is found for the first an average rainfall of 22.8 inches, and for the second one of 21.7 inches. It will thus be seen that, on the whole, the rainfall at Adelaide is diminishing, though very slightly, and perhaps the diminution in the amount of timber may have something to do with the change. Dr. Schomburgk, in searching for illustrations of the effect of trees on climate, goes further afield, and brings forward some striking instances, in which it is evident that loss of forests means loss of rainfall, and *vice versa*. He recalls how the Russians, by burning down some of the Transcaucasian forests at the time of their struggle with the Circassians, converted the country from a fertile land into a desert, simply through the cutting off of the supply of rain. Similar instances of rain having deserted a country denuded of forests have occurred in the Mauritius, in Jamaica, the Azores, and it may also be added to a still more remarkable extent in several of the smaller West India islands. No sooner had the forests of these places been destroyed than the springs and rivulets ceased to flow, the rainfall became irregular, and even the deposition of dew was almost entirely checked. On the other hand, it is generally accepted as a fact that Mehemet Ali increased the fertility of Egypt enormously by planting trees. He alone planted some 20,000,000 on the Delta, his successors followed up the work, and it is a noteworthy circumstance that the rainfall rose from 6 inches to 40 inches. Planting has also, it would seem, produced remarkable effects in France and Algiers. Extensive regions have been planted with gums and other trees, which, for the most part, grew to about 30 feet or 40 feet in height, and it is noticed that the quantities of rain and dew which now fall on the adjacent land are double what they formerly were.

**Boyle.**—The new parochial church of St. Joseph has been opened. The style of the building is late thirteenth-century Gothic. The plan is cruciform, and comprises nave, aisles, and transept, with western tower. Inside the roof is supported by twelve massive pillars of limestone, and the aisles are subdivided from the nave by four bays of the same material, resting upon caps, shafts, and bases. The three altars have been executed by Mr. O'Neill, of Great Brunswick Street, Dublin, and harmonise well with the style of the church. The canopy of the high altar reaches to a height of 13 feet, and is 12 feet wide, while beneath the table is an elaborately-carved panel bearing a motto on either side, and containing a group of the Annunciation and an angel. The general material is of Caen stone, all the shafts being of emperor's red and Irish marbles. In the reredos, which is subdivided into four panels, there are four statues representing the Four Evangelists. The altars are chiefly of Irish marbles. The entire cost of the church is about 8,000*l*. Messrs. Goldie & Child are the architects.

\* The upper terminal is that portion of the conductor which is between the top of the edifice and the point of the conductor.

## NOTES AND COMMENTS.

SOME indignation was excited lately when it was stated in Parliament, on the strength of an affidavit by Colonel YOLLAND, that the directors of the Submarine Continental Railway had stolen a march on the Board of Trade by extending the heading of the Channel Tunnel for about 70 yards beyond the limits agreed upon. An application was accordingly made to the Courts of Justice by authority of the President of the Board of Trade; and as a penalty for sharp practice it was proposed to seize the whole properties of the South-Eastern and Submarine Railway shareholders. The engineer of the company protested against the allegation, and the accuracy of his measurements was confirmed by Sir FREDERICK BRAMWELL and others. But a second affidavit was forthcoming from Colonel YOLLAND, in which he adhered to the truth of his discovery. Afterwards he was induced to measure the Tunnel again, and found that he had incorrectly entered the length on the first occasion. Colonel YOLLAND confessed that his measurement was incorrect, and then he agreed with that of the engineer of the company. Errors are possible in surveying, but considering the interests involved, it was hardly to be supposed that a Government official could confound yards with feet in so short a distance.

THE Committee of the Dumbartonshire Art Club are now making arrangements for an exhibition in the Burgh Hall, Dumbarton, to be opened on October 13. The works of members will hold a prominent place, but many Northern artists will likewise be represented in the collection. During the short time the exhibition will be opened lectures on art will be delivered by Mr. J. D. PEDDIE, R.S.A., M.P.; Mr. ARCHIBALD ORR EWING, M.P.; the Rev. Dr. STORY, the Rev. WM. STEPHEN, Mr. WM. DENNY, and Capt. R. D. BUCHANAN.

It is reported from Rome that the Commission charged with the erection of a monument to King VICTOR EMMANUEL will shortly hold a meeting to consider and decide upon the conditions of the fresh competition that is to be held. It may be remembered that, although the first prize of 2,000*l.* in the former competition was awarded to M. NENOT—a young French architect—the Commission decided that none of the projects presented was worthy of execution. This decision has been very harshly criticised in the French press, its motive being rather naturally attributed to international jealousy occasioned by the success of a foreign artist in this distinctly national and patriotic work. The conditions of the new competition will be made much more stringent and precise than was the case in the first, and the site where the monument is to be erected will be indicated.

THE interest of the objects discovered at the Roman bath at Bath is some reward to Mr. C. E. DAVIS for the anxiety with which he has conducted the excavations. The south-western corner of the great bath has been laid bare, with its steps and pilastered piers, and many fragments have been found. One is a carved stone lion or sphinx, with conventional rugged mane in addition to the more natural form. The face is partially broken, and the legs are not perfect. The form suggests its having been one of the antifixæ on the angles of the hipped roofs. A similar lion was found in building the market. The other is a carved capital of the composite order, a base found a few weeks since enabling a complete restoration. This column is of later character than the greater part of what has been hitherto found, and clearly belonged to an addition to the baths, a colonnade, or more properly a peristylum, on the south of the baths, in the position now occupied by Swallow Street. This fronted the gardens of the baths.

THE French Minister of Fine Arts has contributed magnificently to the interior decoration of the new Hôtel de Ville in presenting the Municipality with two pieces of Gobelin's tapestry after LE BRUN. These works of art are about 16 mètres long by 4 mètres in height, represent respectively the elements Earth and Water, and are each valued at 70,000 fr.

SEVENTY-FIVE more statues are now being raised to their appointed positions on the exterior of the new Hôtel de Ville, Paris. When all the statuary has been placed the building will present an epitome in stone of the history of the French capital, as represented by its most eminent citizens of all ages.

A PORTION of the group now being erected by the sculptor FALGUIÈRE on the Arc de Triomphe in Paris has been freed of its scaffolding. This colossal work consists of four horses harnessed to a triumphal car, with a female figure representing France following this carriage of Victory and dominating the group. For the present the artist's work is only being erected temporarily at his own expense in lath, or rather beams, and plaster, with the object of realising its effect as a crown for the splendid monument at the top of the Champs Elysées. This experiment costs, however, at least 2,000*l.* Should it satisfy the artistic commission that is to be nominated expressly for the purpose of judging its effect, the present temporary structure will be demolished and the group definitively executed in bronze at a computed cost of 20,000*l.*

THE address of Mr. G. W. HASTINGS, M.P., the President of the Social Science Association, contains many subjects well deserving of attention. In speaking of the relation of the dwelling to national welfare, he said: How much, too, of health and wellbeing turns on the question of habitation. Look at the small, low rooms of former times, and consider what was the amount of cubic space in which even well-to-do people had to eat, sleep, and live in those days. Even at this time the supply of good dwellings for the million is a problem which society finds it difficult to solve. But the kind of house that can be built depends much on the conditions of ownership. Flimsy houses, made with poor material, ill-drained and uncellared, with scanty sleeping accommodation, houses intended to last only till they have defrayed the cost of their hasty and speculative building, are all that will be erected on a short or uncertain holding. Such habitations are evil for health and morals alike; they too often shorten the years and corrupt the consciences of those who dwell in them. So you see that when we are talking of tenures of land, of the transfer of real property, of the registration of title, and other such dry and legal things, we may be, and often are, speaking in reality of the wealth and health of nations, of the prosperity or perdition of whole classes—aye, and of the lives and souls of men.

ANOTHER subject introduced by Mr. HASTINGS was the importance of exhibitions of local art and industry. He said: It seems to me impossible to exaggerate the influence produced on the mind by the display of objects of art. Do not we all remember the hour when we first gazed on some masterpiece of creative genius? Was it not a revelation to our nature of something, perhaps blindly felt, but hardly understood before? Think, then, of the effect produced on those, the bulk of the people, who have few opportunities or none of wide travel, by collecting for their view, in an accessible locality, the art treasures of their neighbourhood. Why should not every county in England organise such a display, and educate its inhabitants to a knowledge of the industries and the taste that exist around them?

It is calculated that no less than eleven hundred dwelling-houses are now being constructed in Paris. In order to realise what this means, attempts at comparison with English houses must be put aside, for by far the greater part of these new buildings are of immense size—what the French call *maisons de rapport*—i.e., destined to be let out in suites of apartments, each of which is a complete dwelling in itself, so that the average number of inhabitants per building will be at least ten times greater than that sheltered by London houses. Notwithstanding this abnormal activity in the building trade, which has, moreover, continued for upwards of three years, the value of house property is rising every day. Taking at random a few instances from a list of recent sales in the French metropolis, we find that No. 62 Boulevard Malesherbes has just realised 1,200,050 fr.; No. 64, 1,030,000 fr.; the private residence of M. SECRETAN-OVERNAY, 59 Rue de Ponthieu, 1,500,000 fr.; and that of the Comte d'HAUSSONVILLE, 35 and 37 Rue Saint-Dominique, 2,900,000 fr.

THE Austrian Minister of Public Instruction has purchased for his Government M. FLAMENG's picture of the *Defence of Rorke's Drift*. This is the second time that the subject has been treated by a French artist, M. DE NEUVILLE having executed a work that has been exhibited with success in London and provincial towns.

## ILLUSTRATIONS.

NEW DINING-ROOM, WADHURST PARK: THE SEAT OF  
MR. C. DE MURRIETA.

THIS illustration is reduced by the ink-photo process from a hastily-coloured drawing that was hung in this year's Academy.

Hawley Park stone has been selected for the chimney-piece, as it has a quiet warm grey colour that will harmonise with the internal fitting of a modern dining-room; and it is being sculptured by Mr. N. HITCH to represent events in the lives of SANTIAGO (St. JAMES Major), the patron saint of Spain; and of St. GEORGE, the patron saint of England; the central panel being devoted to the armorial bearings of the owner, a Spanish gentleman residing in England.

In the oak wall-panelling, a playful and (it is to be hoped) pardonable liberty has been taken with the "Ionic" volutes, by introducing little carvings of animals, flowers, &c., between them, no two being alike. As the room is 48 feet long by 24 feet wide, besides bay windows, these varied subjects, in which the carver has been left to indulge his fancy, will afford amusement without detracting from the respectability of the capitals.

E. J. TARVER.

BROADLANDS STABLES, NEAR ASCOT, BERKS.

THESE stables have been recently erected at Broadlands, near Ascot, for Mr. WM. QUILTER, from the designs of Messrs. CHRISTOPHER & WHITE, architects, 16 Bloomsbury Square, W.C.

The accommodation consists of an eight-stall stable, two separate loose boxes and standing for a pair of visitor's horses; coachhouse to hold three or four carriages and a drag; large harness-room, connected to stable by a covered way, the latter forming a place for harness cleaning; chaffhouse and corn-place, off stable, with granaries over; hayloft over coachhouse, with direct communication with chaffhouse; and general mess-room, &c., for the stablemen.

On the upper floor are rooms for the head coachman, which are so arranged that the windows completely command the whole of the premises and yard, and an interior view of the eight-stall stable. There are also two rooms for "helpers" over the archway entrance.

Owing to the fall of the ground a large potting-shed has been formed for the gardener under the coachhouse.

The whole of the foul drainage is taken to a tank for use in the kitchen garden.

Spring water is laid on for washing and general purposes, by means of a steam pump, from a deep well, which supplies the house as well as the stable; and there is a rain-water tank to supply drinking water for the horses.

The whole of the stables and yard are paved with EASTWOOD'S adamantine clinkers. The walls are of local red bricks, the gables being finished with half-timber work and brick nogging; and the roofs are covered with the Coalbrookdale plain tiles.

The work has been satisfactorily carried out by Mr. WATSON, builder, of Ascot, at a total cost of 1,691*l*.

QUIN ABBEY, CO. CLARE.

THE Abbey of Quin, which is one of the ruins in charge of the Commissioners of Public Works in Ireland, is about five miles from the county town of Ennis. In his report, as Superintendent of National Monuments, Mr. T. N. DEANE, R.H.A., gives the following account of the building:—

"The monastery of Quin was founded early, and was consumed by fire in 1278. In 1402 it was again founded for Franciscan friars by SIOGA CAM MACNAMARA, but Father WADDING places it at a more ancient date. Pope EUGENE granted license to MACNAMARA in 1433, to place friars of strict observance in this monastery. In the same year MACON DALL MACNAMARA, lord of Clancoileau, erected this monastery, being a very beautiful building 'of black marble.' The abbey was granted to Sir TIRLAGH O'BRIEN in 1583.

"The MACCONMARAS or MACNAMARAS were chiefs of Triocho Caed Hy Cassin, which territory is now the barony of Tulla, county Clare, and contained part of the barony of Bunratty. They were styled chief of Clancoileau from one of their chiefs in the eighth century. The MACNAMARAS held the office of hereditary marshals of Thomond, were powerful, and had numerous castles. In 1278 DONAGH, son of BRIEN ROE, defeated the son of the Earl of CLARE in the battle of

Quinchy. They burned the church on his people (the English), and put great numbers to death.

"The foregoing notes of the history of the abbey are necessary for the careful investigation of these most interesting ruins. We have three distinct periods mentioned—1278, 1350 to 1402, and 1433—EDWARD I., EDWARD III., and HENRY VI. Portions of the conventual buildings may be later.

"The ground-plan is partly etched in lines and part black. The etched portions are the remains of a fortress of considerable dimensions, Norman in plan and character. The black parts are fifteenth-century work, the "beautiful strong building of black marble." The eastern window is of late date. The southern windows of choir are thirteenth-century work, inserted in the centre of the curtain wall of the Norman castle. The western window is of same date, and the western wall of the original structure has been utilised by cutting it away in parts and inserting windows. One of the entrances to the keep still exists and opens into the church beneath the tower. The excavations that have been made have led to the discovery of a staircase in the eastern curtain wall of the fortress A on plan, a sub-entrance in the north-east tower, and other details in connection with the fortress. The foundations of very extensive outlying buildings of early date are discernible. Thus we have a curious question to solve—when was the fortress built and when was it destroyed? If its date was prior to the Norman invasion it is very remarkable as an indication of advanced military knowledge at an early time; if subsequent to the invasion of 1171, by whom was it destroyed? The defeat of Lord CLARE by DONAGH, son of BRIEN ROE, refers to a period not later than 1278, prior to which I place the building of the first abbey, and which must have been built on the remains of a fortress. Assuming that the fortress is of Norman origin, it would leave less than a century for its erection, destruction, and subsequent building of the earlier parts of the abbey. I have searched the authorities on Irish architecture and can find no nearer clue to the question than the dates already given. We have no evidence of such structures as this castle having been built by the O'BRIENS or the MACNAMARAS, the early chieftains of this portion of Ireland. We know that the Norman occupation penetrated very little into Clare."

The late Rev. J. L. PETIT read a paper on "The Abbeys of Ireland" at the Institute of Architects on March 23, 1863. In describing the Abbey of Quin, he said it was very perfect, and had undergone little mutilation beyond the loss of its roof. "It has," he said, "the large south transept and tall, slender, central tower, with arches not more than 8 feet wide, the width of the nave being about 24 feet. The roof of the tower compartment is groined. On the north side of the chancel, in the position generally assigned to the Easter sepulchre, is a tomb or shrine of three trefoil arches, apparently of a late date. In fact I did not notice any architectural features which might not belong to the fifteenth century. The cloisters are plain, and have small arches; some of the shafts have a spiral moulding. This abbey seems to have been fortified, as there are large round towers flanking on the eastern side."

Quin Abbey is, according to Mr. PETIT, an example of the Franciscan as opposed to the Cistercian type of monastic building, and which he considers to be peculiar to Ireland. The Franciscan plan, he says, "consists of a nave with or without a single aisle; a choir, generally without aisles, of much the same length as the nave; and a large transept on one side of the nave, to which transept is often attached an aisle nearly as large as itself. Between the nave and choir is erected a lofty tower, the lower part of which is oblong in its plan, reaching from wall to wall of the church; the upper part, whether square or oblong, is much narrower, and either rests upon arches thrown across the lower stage from east to west, above the main arches, or has its north and south sides carried down to the ground within the building (in which case they are mostly pierced by an arch), thus narrowing the entrance from the nave into the choir to a space not exceeding 8 or 9 feet. This tower always looks as if it were an insertion, and in many cases evidently is so, as it cuts windows and arches in two; but in later churches it is probably included in the design, and is of the same date with the rest. It seems to have been divided by several floors, and may very possibly have been occupied as a place of safety. The side of the church, which has no transept or aisle, forms a side of the

square of the monastic buildings, which are simple and well and regularly arranged. A cloister, of which the arches are very small, and usually pointed, and without foliation, surrounds the open space of the square. The ground plan is on the whole very compact. It may be remarked that the roof in general appears to have been supported by a gable at each end, and not to have been joined on to other roofs—at least where the main roof of the church was concerned, for even the transept has a gable upon the wall of the church as well as that at its end. The Franciscan abbeys seem generally to have had their monastic buildings on the north side of the church, but by no means without exceptions. The simplicity and straightforwardness of arrangement which prevails in these buildings is worthy of notice; unless the construction by which the tower is supported may be so called, we find no complicated architectural contrivance."

In the course of the discussion which followed the reading of the paper, Mr. GORDON M. HILLS said that Quin Abbey was a late Franciscan foundation dating from 1433. It exhibits the peculiar Irish cloister, the lofty slender tower raised upon the apex of two gables which cross the church, and which form at the base a partition between the nave and chancel, pierced only by a narrow communication between those parts. The walls which form the external faces of the Abbey are thicker and stronger than those which form the inside faces of its quadrangle, the south walls of the church being from 8 feet to 10 feet thick. The Abbey was fortified, but it was not quite so military as it looks now. The circular bastions were added in later times after the suppression of the monastery.

At the same meeting Mr. STREET said he ascribed the preservation of the large number of abbey towers in Ireland (such as that at Quin) to the admirable arrangement of the gutters. They were all of stone, and were as perfect now as on the day they were built. No lead was used, but the stones forming the bottom of the gutters had a channel cut in the centre of each, discharging the water through a succession of gargoyles, and then other stones were placed over the joint, so fitted that no water had ever got into those towers, though the gabled roofs with which they were covered had in almost all cases disappeared. This mode of construction, Mr. STREET said, afforded a good lesson to architects of the present day.

### THE EDINBURGH ANTIQUARIAN MUSEUM.

AN important addition, says the *Scotsman*, has just been made to the Museum of the Scottish Society of Antiquaries in the shape of a reproduction of a Celtic cross, recognised by authorities on the subject as a typical and peculiarly interesting example. The cross in question stands, and has stood from time immemorial, in the ancient churchyard of Kildalton, Islay; where, we understand, it attracted, some years ago, the attention of Dr. Arthur Mitchell as an object of special significance. It was sufficient to suggest that the characteristic features of such a relic should have a place in our national collection of antiquities in order to engage the zealous co-operation, towards that end, of Mrs. Ramsay of Kildalton; and to that lady the public are now indebted for a copy of the cross, capable of answering any practical purpose that could be served by the original. The cast has been made in Portland cement, by Mr. W. Stevenson, of the Museum staff, the process employed being somewhat similar to the ordinary method of reproducing statuary in plaster of Paris or metal. A highly satisfactory result would seem to have been secured, the duplicate showing with perfect accuracy the surfaces of the cross, with all their blurred and half-obliterated details of carving, and even such minutiae of texture as the crystals of felspar that here and there stand out in sharp relief from the generally rounded contours of the weathered gneiss. The cast has been well placed in the Museum, on a pedestal of the same height as the boulder which forms the basement of the original. The height of the cross from the top of the pedestal is 8 feet 9 inches, the width across the arms 4 feet 4½ inches, and the diameter of the circular glory 3 feet 3 inches. As was to have been expected, in an island where westerly winds are so prevalent, the face of the cross turned towards the west shows more weathering than that looking in the opposite direction. Yet the carving on the former face can be almost as easily traced out as that on the latter, owing, apparently, to its having been originally executed in bolder relief.

In the opinion of Mr. Joseph Anderson, the able secretary to the Society of Antiquaries, who has devoted special attention to this branch of archæology, the cross may be regarded as perhaps the best example of the best period of Celtic art in stone to be met with in this country. While chary of assigning an exact date, Mr. Anderson considers it to belong to a time when the art, in the absence as yet of any very definite influence from external culture, still remained pure and native; though probably it ought to be

placed about the commencement of the period when a process of degradation was about to set in. A notable characteristic of the work is a certain freedom and spontaneity in the execution, which denotes the hand of an artist untrammelled by technical rules, and giving scope in his craft to the play of a fresh and fertile fancy. There has been, for instance, no painful effort to secure perfect symmetry. One arm of the cross does not exactly balance the other, either in length or thickness; nor does the glory look as if its circumference had been nicely adjusted with a pair of compasses. The craftsman, in short, seems to have gone very much by the eye, making the form correct enough, yet still with that pleasant accent of variety which gives charm to a piece of hand-made Venetian glass in comparison with the hard precision of one that has been turned out of a mould. In its general effect the cross looks admirably proportioned; while the surface decoration has been applied at once with a fine eye for the effective filling of the space to be covered and with a feeling for the beauty of flowing curves, that has been efficiently seconded by the labouring hand. The sides of the cross are blank, and this would also seem to have been the condition in which the east face of the glory was left; for although, as has been said, this front looks less severely weathered than the other, the circular wheel shows here no such remains of tracery as it bears on the western face. The intersection of the arms and upright in the east aspect of the cross is marked by a large boss, which has evidently been formed of a number of animal forms, intricately interlaced; their limbs and tails growing outwards into elaborate tracery, which covers the whole surface of a circular panel, and is enclosed with what appears to have been a rope moulding. On either side of the circle there is carried over part of the arm a panel filled in with ornament, consisting of serpents twining about rounded knobs, that may or may not have been intended for apples. A similar panel extends downwards, occupying part of the upright; the corresponding space above the central circle presenting a couple of birds feeding on a bunch of grapes hung between them—an early Christian symbol of common occurrence in the Catacombs; and the panel above this again, which completes the height of the shaft, offering a quaint representation of David rescuing the lamb from the lion, surmounted by a couple of winged angels. In the spaces at the ends of the arms there appear, on one side, what may be taken for a rendering of Abraham and Isaac on Mount Moriah; on the other, a group whose meaning has not been deciphered, unless the seated figure, with uplifted hand, be blessing the personage kneeling in front. The lower part of the shaft shows, under the serpent tracery above referred to, a relief of the Virgin and Child, flanked with angels; and below this, a large panel filled with a familiar form of Celtic ornament—the double escaping spiral scroll, such as may be seen in, for example, the beautiful illuminations of the Book of Kells. So far as can be judged from their present condition, the curves would appear to have been designed and carved with remarkable spirit and freedom of hand. The edging of these lower panels has been a plain moulding, apparently passing, higher up, into a somewhat more ornate form. Turning to the west face, the lower part of the upright is found to be ornamented with a variation of the serpent and knob design seen on the other front, the general character of the decoration being similar to that of the cross called St. Martin's, at Iona. The surface is diversified with bosses, some of which present in front a hollow occupied by a ball—the largest one having one in the centre of the panel having three balls, which have been supposed to imply a reference to the Trinity. Higher up the ornamentation exchanges the zoomorphic form for that of expanding and escaping spirals interspersed with bosses. At the intersection of the shaft and arms there is a large boss, whose design cannot very well be made out, but which is surrounded with an intricate congeries of serpents that run into or open out of its forms, the circular panel thus occupied being enclosed with an interlaced moulding. Round the outside of the circle are placed at equal intervals four animal figures in high relief, the two set on the upright having their heads pointing upwards, and showing their backs to the spectator; the others, on the arms, being designed in profile, with their heads turned towards the central boss. The heads in every case are gone; but from what remains the animals might seem to have been intended for lions. Though rude in form, they are not without a certain appearance of vitality, and their limbs and tails develop into surface tracery. The outer panels of the arms show bosses surrounded with spiral ornament that seems to grow out of them; the same design with artistic variation appearing on the upper part of the shaft, where it is surmounted by two strange creatures treated in the true spirit of decorative art. The four quadrants of the glory show alternating bands of interlaced and fret ornament, and the whole of this face of the cross is surrounded with a well-marked rope moulding.

Along with this antiquarian treasure there have been received from Mrs. Ramsay several other casts of monumental stones. One is from a representative specimen of the later sepulchral slab common in the Islay district. Its surface shows in low relief a large sword, with reversed guard, and a pair of spears underneath, the scroll decoration being introduced in the bordering space. Another cast shows a rude stone, with no dressing except on one side, where it offers a rudely-sculptured representation of a Celtic

cross. A third produces a rough, unshapen slab, bearing an incised Latin cross; and a fourth, a slab cut into a simple form, and show the same symbol in low relief within a circle. These casts, one and all, seem admirably exact, and may therefore be studied with advantage by all who take an interest in our ancient native art.

### THE MEMEL TIMBER TRADE.

THE report of Vice-Consul Richter on the trade and commerce of Memel states that the value of the timber exported during 1881 was 500,340*l*. In 1880 the value of the timber was 544,850*l*.

The prices obtained were as follows:—

	Per Load, of 50 cubic feet.					
	£	s.	d.	£	s.	d.
Fir beams—						
Crown ... ..	3	5	0	3	7	6
I. Middle ... ..	3	2	6	3	5	0
II. " ... ..	—	—	—	2	15	0
Beams under 11 inches... ..	2	2	6	2	5	0
Beams for building ... ..	2	0	0	2	5	0
Pine beams ... ..	1	12	6	1	17	6

In expectation of the new arrivals selling cheaper some cargoes were contracted for at about 2*s*. 6*d*. per load under the above quotations, but the former rates were maintained afterwards, and about 12,500 loads of the new supply were shipped before the winter set in.

Fir sleepers sold at 28*s*. to 29*s*. per load of 10 × 10 inches and 8 feet 12 inches long. In autumn the freights by steamer were too high, but in November and December they declined, and then a considerable quantity could still be exported.

The business in fir and pine deals and planks has not been satisfactory. The sawmills, formerly all driven by wind, have nearly all been altered to steam mills, which of course can do a great deal more work. In consequence of the late arrival, and encouraged by the very good results of late years, the owners—not sufficiently bearing in mind that the larger trees in the Polish forests gradually have become scarce, and that in the floats many logs of smaller dimensions are now mixed up, which of course yield one plank or one deal less—anxious to secure, if possible, full employment for their mills, they paid high prices for fir and pine logs, hoping that the good demand for sawn goods would continue, but their expectations were not realised. Already early in spring large supplies were thrown into the markets from Norway and Sweden; the demand in England for 3-inch planks ceased, and prices declined from 7*l*. 10*s*. to 7*l*. per Standard I. middle. Even at the lower rate sales became very difficult, and it was a great relief that Holland became a purchaser for these sorts and in some way replaced the deficiency. For 1 and 1½ inch deals a moderate demand continued nearly through the year, relaxing towards the end of the season.

In spring the demand for oak wainscots was moderate, and 5*s*. 3*d*. per cubic foot crown, 4*s*. for I. brack was made, but in summer prices declined to 5*s*., later to 4*s*. 6*d*., and in autumn no more than 4*s*. 3*d*. for crown, and 3*s*. for brack could be obtained. Oak beams were dull, and only small lots were placed at 95*s*. to 100*s*. per load crown, brack 10*s*. less.

### LAND VALUATION IN IRELAND.

A NEW code of instructions to the Sub-Commissioners under the Land Act has been issued by the Chief Commissioners. It has been suggested by the recent change in the procedure by the appointment of seventeen official valuers, who will have a salary of 1,000*l*. a year each. Instructions have been issued to the valuers for their guidance in forming an opinion as to what a fair rent should be. The valuers will have simply the duty of advising the Sub-Commission on that matter; they will neither appear in Court nor take part in the judgments given. In future the procedure will be as follows:—A valuer will be attached to each Sub-Commission for the purpose of valuing the farms with one of the lay assistant-commissioners, who will afterwards hear the case in Court, together with the legal Sub-Commissioners, while the second Sub-Commissioner will in turn perform a similar duty with the valuer. The desirability is pointed out of having the cases on one estate heard, and the holdings valued, by the same assistant-commissioner. Subject to this recommendation, the Sub-Commissioners are left free to regulate their own business as they may think convenient. In cases where the valuers may be unavoidably absent, having to give evidence in cases with reference to which they valued holdings before their official engagement, the Sub-Commissioners may continue the old practice. The legal Sub-Commissioner may require the second lay Commissioner, in all cases in which he thinks it necessary or proper to do so, to visit and report on the holding. In cases where the persons may be absent when decisions are pronounced, the registrars shall notify the result to them. A form of order to be made with respect to the erection of labourers' cottages is transmitted to the Sub-Commissioners, together with instructions, diagrams, and specifications

issued by the Commissioners of Public Works. It is intended that any tenant applying to the Board of Works for a loan for the purpose of building labourers' cottages shall be supplied by the Board with all necessary information. Any tenant intending to build without a loan will be furnished with information by the secretary of the Land Commission. Complaints have been made by tenants generally that the Commissioners of Public Works will not lend less than 100*l*. The cause of complaint is now removed by a communication to the Land Commissioners to the effect that the Board of Works are prepared to lend any sum, however small, provided it is sufficient to carry out the order of the Land Commission Court. They recommend, however, that the Sub-Commissioners should name some adequate sum so as to leave a margin for contingencies and costs. They also point out, as an objection to the lending of very small sums, that the cost of inspection and other matters chargeable to the loan would be in a very high proportion to the amount available for expenditure, and they suggest that where a fair rent has been secured to the tenant for fifteen years on a holding large enough to employ labour outside his own family, the tenant should be able to incur the small expenditure necessary without assistance. The Sub-Commissioners are further instructed, when they make an order for the improvement of a cottage, to specify in detail as much as possible the extent and nature of the improvements to be made. These new instructions, it may be expected, will facilitate the business of the Sub-Commissioners and remove some of the complaints now made of delay and uncertainty in their proceedings.

The following is the list of official valuers appointed for the different counties of Ireland:—Antrim, Mr. John Wilson; Down, Mr. James Armstrong; Armagh, Mr. A. S. Deane; Tyrone, Mr. Thomas Roberts; Donegal and Fermanagh, Mr. James Magill; Cavan and Monaghan, Mr. E. L. Hunt; Leitrim, Roscommon, and Sligo, Mr. George Adamson; Mayo, Mr. John Pierce; Galway, Mr. Alexander Cruikshank; Limerick and Clare, Mr. Thomas Kidd; Kerry, Mr. Peter G. Griffin; Cork, Mr. William Evans; Tipperary and Waterford, Mr. W. C. Connell; Dublin, Kildare, King's and Queen's Counties, Mr. W. H. Gray; Longford, Westmeath, Meath, and Louth, Mr. E. G. Peet; Carlow, Kilkenny, Wexford, and Wicklow, Mr. J. M. Walker; Londonderry, Mr. Chas. James Greer.

### PUBLIC WORKS IN NEW YORK.

THE following particulars respecting some of the works in progress in the State of New York have been furnished by Mr. Consul-General Archibald:—

The Brooklyn Bridge is slowly nearing completion. Its opening for foot passengers and vehicles is promised before the close of the year. The bridge was commenced in January 1870, and its cost up to the present time has been about 14,000,000 dols. Probably 1,500,000 dols. more will have to be expended to complete it.

The following statistics in regard to construction may be of interest:—The New York tower contains 46,945 cubic yards of masonry, weighs about 124,000 tons, and its foundation is 78 feet below high water. The Brooklyn tower contains 38,214 cubic yards of masonry, weighs about 93,079 tons, and its foundation is 45 feet below high water. Both towers measure 140 feet in width by 59 feet in depth at high-water line. Each tower is 278 feet above high water. Height of towers from high water to roadway, 119 feet. Height of towers above roadway, 159 feet. Height of centre of river span above high water, 135 feet. The 21,184 wires composing the four cables, joined end to end, would cover a distance of over 14,357 miles. The promenade for foot passengers is placed in the centre of the bridge, with the railroad tracks next to it on either side, and the waggon roadways further beyond, next the sides of the great span. This promenade will be nine feet higher than the other thoroughfares, and the view of the river and the two cities from this part of the bridge will be very fine. It is intended that the bridge shall be lighted at night by electric lights. The grade of roadway, 3¼ feet in every 100 feet. Anchorages at base, 129 by 119 feet. Anchorages—height in front, 89 feet; in rear, 85 feet. Weight of each anchor plate, 23 tons. Main span of bridge, 1,595 feet 6 inches. Each laid span, anchorage to tower, 930 feet. Brooklyn approach to bridge, 971 feet; New York approach to bridge, 1,562 feet 6 inches. Total length of bridge, 5,989 feet. Width of bridge, 85 feet; width of promenade for foot passengers, 15 feet 7 inches; width for railway on each side, 12 feet 8 inches; width for carriage-way on each side, 18 feet 9 inches. The first wire run out, May 29, 1877. Cable-making really began, June 11, 1877. Number of cables supporting bridge, four. Diameter of each cable, 15½ inches. Each cable contains 5,296 parallel steel wires. Each single wire in the cables, 3,578 feet in length. Weight of wire in each cable, 1,732,086 lbs. Strength of each cable, 24,621,780 lbs. Total strength of the four cables, 108,487,120 lbs., or 54,243 tons. Permanent weight of bridge from anchorage to anchorage, 14,680 tons. Transitory load on bridge, estimated, 3,100 tons. Total weight to be supported, 17,780 tons.

The progress made during the past year towards the completion

of the Capitol at Albany has been satisfactory. The sum already expended on it is over 12,000,000 dols., and a further large sum will be requisite before it can be finished.

Owing to the nature of the ground selected as the site for the new Produce Exchange, New York, great delay has occurred in making a good foundation for the structure. But this having now been accomplished, the building will be proceeded with with all possible despatch.

The Hudson River Tunnel (Jersey City to New York) is being pushed forward energetically from both sides of the river, and its progress during the past twelve months has not been marred by any untoward accident, such as in the preceding year resulted in the loss of so many lives.

Owing to the long-continued drought last autumn New York suffered from a scarcity in the water supply, which caused much uneasiness and alarm to its residents. To provide against a recurrence, the Governor of the State has brought the subject under the special consideration of the Legislature; and in view of the large expenditure, estimated at about 12,000,000 dols. to 15,000,000 dols., which would be necessary for a new aqueduct, has suggested that the question should be referred, in the first instance, to a commission of inquiry, consisting of the leading citizens of New York.

### THE DRAINAGE OF MALTA.

SOME of the people of Malta have petitioned the Earl of Kimberley against the completion of the proposed drainage works. They say:—

We feel it our duty further to renew our protest against the unfairness of enforcing a system of drainage which the population in general do not approve; which they consider far beyond the means of the island to maintain in working order by means of fresh water, for want of a permanent and abundant supply, and ruinous to the best interests of the country if intended to be put in constant operation by the use of salt water, and therefore impracticable and inefficient, and likely to be injurious to the public health. And to repeat our sense of the impolicy in the determination of your lordship not to comply with our request to stay, until the matter is properly inquired into, the preliminary drainage works commenced in Valletta and Floriana; while we have already admitted, although our views have not been correctly understood, the absolute necessity of the continuous removal of all sewage matter from human habitations to a distant place where it can be disposed of without prejudice to health, which, we humbly submit, is the primary and sanitary object of every system of town drainage.

We beg to call your lordship's attentive consideration to the opinions of experienced sanitarians, such as Douglas Galton, Esq., C.B., late Director of Public Works and Buildings and Assistant Under-Secretary of State in the War Department; Dr. John Sutherland, Professor Dr. Parkes, and other eminent gentlemen, upon this social interest, bearing on the impracticability of the water-carriage system of drainage in Malta, and with regard to the advisability of adopting some other method instead, not only in the fortified towns, but in every inhabited locality all over these islands, to the great advantage of agriculture, which might be highly improved by the application of sewage to the land.

For this we have appealed, and after perusal of this and other papers already forwarded, we humbly trust your lordship will be persuaded that the petitioners are not against a practical, consistent, and economical mode of removing town sewage, and that they, more than the local authorities, are anxious to secure the general healthiness both of their towns, whether fortified or not, as well as of all the villages, hamlets, &c., and to see them restored to the comparatively satisfactory condition they were in at the time when Malta was renowned as the healthiest spot in the Mediterranean, which only the unskillfulness and repeated errors of military administrations have reduced to its present rather unsatisfactory condition; whilst the latter now insist on the enforcement of the impracticable water-carriage system of drainage as a panacea to remedy all the evils in this respect inflicted on these islands.

The Colonial Secretary in reply writes:—I regret that there should be any considerable body of opinion in Malta adverse to the principles upon which, after having recourse to the highest professional advice, and after very full examination of the measures recommended, it has been determined to carry out the comprehensive system of drainage of which the portion objected to is an extension. Her Majesty's Government contributed to this work from imperial funds an amount not far short of half of the total cost; the arrangement being that about 40,000l. shall be provided by her Majesty's Treasury and about 54,000l. from the funds of the island; and looking, on the one hand, to the urgent necessity for improving the drainage in order to preserve the health of the dense civil population as well as of the garrison troops, and, on the other, to the great benefit derived by the island from the very large annual expenditure on the imperial military and naval forces, it cannot, I think, be deemed unreasonable that a considerable portion of the expenditure in question should be provided from local funds.

### CHURCH BUILDING IN CARLISLE.

THE annual meeting of the Carlisle Diocesan Church Extension Society was held lately. The Society was founded twenty years ago, and the total sum expended on the objects of the Society since its first institution amounts to 48,973l. 3s. 9d. During the same time the amount arising from public and private sources together has reached 248,826l. 12s. 8d.; and the results of this combined expenditure are the building, restoring, or improving 98 churches, the building or improving 73 parsonages, and the augmentation of 103 benefices.

The Bishop of Carlisle, who presided, said that if there was nothing else in Bishop Waldegrave's episcopate to which they could look back with satisfaction, he thought the one great work of founding the Society in the diocese of Carlisle would be a crowning and admirable monument to that episcopate. He who entered upon the fruits of Bishop Waldegrave's labours should not be discharging his duty if he did not express upon this occasion as he had upon one or two occasions, his hearty thankfulness for that which he had done, and his full appreciation of the wisdom and the zeal with which he was animated. When one looked at the picture of the condition of things twenty years ago as drawn by Bishop Waldegrave, he thought it was impossible not to feel that the condition of things in the diocese of Carlisle was then very discouraging, and there was a great deal to depress anybody who looked to the condition of things round about him. But when he looked to the state of things now, as compared with the state of things then, he thought it was impossible to use the language which would exaggerate the satisfaction that one felt as to the change that had taken place. Of the places mentioned in the report that were in need of churches twenty years ago, there was only one place without a church—Ellenborough. That place was in reality an outlying township of Dearham, but it lay close to Maryport, was divided from Maryport by the little River Ellen, and it was in that unfortunate condition that it was a long way from its own parish church, and was nearer to the parish church of Maryport, to which, however, it did not belong. Hitherto it had been a problem which he had not been able to solve. He had been thinking about it—in fact, he had a plan about it. It had a school service; the people were not entirely neglected; but with the exception of Ellenborough all the other places mentioned had been supplied with additional church accommodation during the twenty years since Bishop Waldegrave made the speech referred to. The total sum expended on the objects of the Society since its first institution was in round numbers 50,000l., and the amount received from public and private sources had reached a quarter of a million, making a gross total of about 300,000l. That was really a remarkable result; but it did not by any means represent all that had been done. He could mention a number of churches that had been built with which the Society had nothing to do. Take, for example, those four churches at Barrow which he opened and consecrated in one day. They cost 24,000l., and the money came out of two or three pockets. That did not come into the accounts at all. He could mention a number of instances of the same kind. He thought they had a right to be encouraged by the past to look forward with thankfulness to the future. Speaking of the three purposes of the Society—the building and restoration of churches, the building or improvement of parsonages, and the augmentation of livings—he thought that the first purpose could never entirely come to an end, because population was always starting up in a diocese like this, with its great iron-fields here and there, and they might always expect that there would be calls upon them to help in erecting new churches. So far as the restoration of old churches was concerned, he thought they had very nearly come to the end of their work. He thought he could count the number of churches in a discreditable condition, and unsuitable for public worship in the diocese upon his fingers. That department of work, which was very much due to the neglect, of their forefathers, had nearly finished. As to parsonages, he thought he might say that part of their work was, roughly speaking, practically accomplished. Therefore in the future their work must very much be connected with the building of new churches and the augmentation of livings.

### AN AMERICAN EXHIBITION.

A NATIONAL Bazaar, Art and Industrial Exposition will be held in the rotunda and adjacent halls of the National Capitol at Washington, from November 25 to December 3, 1882, as authorised by joint resolution of the Senate and House of Representatives, August 7, 1882. The object of the exhibition is to raise funds with which to erect a statue in Washington to the memory of General James A. Garfield, late President of the United States. A committee of the Society of the Army of the Cumberland have already collected for the purpose about twenty thousand dollars, and expect, with the results of the exposition, to possess a sum sufficient to secure a worthy memorial. The art exhibition will be under the direction of Washington artists. It is expected that many artists and amateurs will each contribute one work as a gift to the fund, besides lending other works for exhibition.

## CHURCH BUILDING AND RESTORATION.

**Loughborough.**—A Baptist chapel has been opened at Loughborough. The chapel is built of brick, with stone dressings. The architect is Mr. J. W. Chapman, and the builder Mr. Moss. The heating apparatus was supplied by Messrs. Messenger & Co. Messrs. Hall executed the stonework; Messrs. Colman & Son the ironwork; and the plumbing and glazing by Mr. Simpson.

**Crewe.**—A new chapel and school are about to be built at Hightown, Crewe, for the trustees of the United Methodist Free Church. The chapel will seat 700 adults, and the school 250 scholars. Suitable vestries, classrooms, and outbuildings will be provided. The builder is Mr. A. P. Cotterill, of Crewe, and the buildings have been designed by Mr. S. Hurst, of the firm of Messrs. Maxwell, Tuke & Hurst, architects, Southport, and will be carried out under the architect's supervision.

**Southport.**—Extensive alterations and additions are being made to the Wesleyan Chapel, Blowick, Southport. The additions comprise six large classrooms, a library, and a detached lecture hall, &c. The builder is Mr. T. Duxfield, of Southport, and the works are being carried out from the designs and under the superintendence of Mr. S. Hurst, of the firm of Messrs. Maxwell, Tuke & Hurst, architects, Southport.

**Car Colston.**—The ancient parish church has been restored and reopened. The works of restoration have been carried out from the designs of Mr. Fowler, architect, of Louth; Mr. Rudd, of Grantham, being the contractor. The church consists of nave, with side aisles, chancel, porch, and tower, the style being fifteenth century.

**Whitstone.**—The parish church has been reopened after restoration. The work has been carried out by Mr. Wiffen, of Holsworthy, from the plans of Mr. Hooper, of Hatherleigh. The old Cornish barrel-roof has been reconstructed, the carved bosses of the old roof being retained. All the new woodwork is carved after work that remained in the old edifice. The chancel has been extended, and a new porch added, and the church has been re-seated and floored. The cost has been about 1,500*l*.

**Birmingham.**—The foundation-stone of All Saints' Church, Small Heath, has been laid. The building will be erected in the Early English style of architecture, simple in character, and with little ornamentation. When completed, it will consist of nave, with tower and spire at the north-west angle, north and south aisles and transepts, chancel, morning chapel on the north side of the chancel, and sacristies on the south side for the clergy and choir, with an organ-chamber over the latter. The footpace to the altar is to be raised nine steps above the floor of the body of the church. The exterior walls will be of red brick, with red Kenilworth stone mouldings and dressings, and the interior will be lined with white bricks, with red moulded brick arches to the nave; while for the transepts, chancel, windows, &c., Kenilworth stone mouldings and dressings and wilderness stone columns will be used. Provision is also made for Devonshire marble shafts to carry the roof principals. The first contract, consisting of the nave and north aisle, gives accommodation for 510. The architect is Mr. A. E. Dempster, and the builders are Messrs. Barnsley & Sons—all of Birmingham.

**Knighton.**—Heyope Church has just been reopened. The former church was of great antiquity, but alterations had so disfigured it that it would be difficult to fix its date. Traces have, however, been found of early Norman work, and probably this was one of the oldest churches in the district. The restoration has been carried out from designs of Mr. Pearson, R.A., London, by Mr. John Williams, builder, of Knighton. The church consists of nave, chancel, vestry, and tower with three bells; the chancel being divided from the nave by the old rood-screen in use in the former church. The sittings and roof are of plain oak, neither stained or varnished, and the floor of the chancel is paved with encaustic tiles. The church will accommodate about 200 people, and has cost altogether nearly 1,100*l*.
